T. C. C.—We should certainly give the preference to B. We give no firm's names in this column, and we only advise upon the selection made by our correspondent.

EGDOL.—If a hand-camera is required, we place 4 first and then 8. If a detective camera certainly 2, with B lens.

EDWARD JURY.—The prints will shortly be under criticism for our next "Special Number," shall we retain them? please let us know.

JAMES BLACK.—See preceding reply, cannot fix a date just at present.

JOHN G. WATSON.—Yours is very fair work, and we find no glaring fault in any of them. In No. 3 you might have studied the lighting a little, but we have often seen worse work. Your lens gives good definition, and we shall be pleased to see your work again at the end of the season.

J. C. M. O.—We prefer No. 1, very handy, next No. 4, which is more complicated.

GAVIN T. MCCOLL.—Not one of the lenses named, except perhaps B, likely to answer your purpose. D, should not think it at all likely.

H. A. FARDELL.—You cannot do better than follow the instructions given in the article named. Be careful to have the light well diffused, i.e., filtered through either ground glass or tissue paper. Your query is also inserted.

J. F. FITNESS.—We believe A to have many good points, but the makers tell us they are so busy that they cannot send us one for inspection, therefore, upon that one we are unable to advise. B is rather complicated. C is very handy, and really an excellent apparatus. D we do not care for.

COUNTRY AMATEUR.—"Photography for All" (Harrison), "Modern Dry Plate Photography" (Burton), "Experimental Photography" (Leaper).

W. E. GALLOWAY.—All the slides are still at the Palace, so it is at the moment impossible for us to criticise even yours. It is always of use going on with anything until you have succeeded in doing work as good as the best. We thank you for the present, remember they are not for ourselves, but in trust for those interested in photography. This winter we have had nearly 2,000 in circulation. You will hear more about yours later on.

E. E. BOWDEN.—No. 4 first, and then No. 1, both quarter-plates; you can buy No. 4 with lens at your price.

LIGHT BLUE.—The 1 lens is a beautiful and accurate instrument, it cannot be surpassed, and if you do not mind price we should strongly advise you to buy. You might pick one up in our Sale and Exchange columns second-hand.

STANIS.—You have evidently allowed light to get through to the plate. Send up the negative.

LOLA.—The R.R. lens recommended by the maker. The limit of prints for the "Ladies' Competition" is twelve prints, and may be selected from any of the subjects named. The cheap apparatus made by the firm you mention will answer all your requirements. Thanks for the prints, we are wanting some for our household albums.

H. H. G.—We shall be pleased to help you if possible, and would suggest that an application of very dilute shellac varnish to the leaves might be an easy means of guarding against the trouble you fear. Certainly send prints, but as we are kind, be merciful and don't send a lot. Can't say much for the print you enclose, your foreground is out of focus; show us some later work.

S. H. A.—The following order, 1, 6, 2.

GRESHAM.—Really we cannot compliment you upon one of the photographs sent us. You do not take care to focus truthfully—the pictures all lack definition. In every one there is unmistakably flare

spot, probably due to reflection, and not from any fault in the lens. You appear to quite understand what you are doing, but the results are distinctly unsatisfactory.

R. B.—We think you will be quite pleased with the B shutter.

PIRRIE.—There is the same depth as in ordinary dark slides. Photographers should refuse to have plates of varying thicknesses, and directly such are discovered in the dark-room they should be carefully repacked and returned to the makers, who would soon find a means to buy glass of uniform thickness.

VITRUM.—Try a neutral tint. If cut, fill with opaque liquid as you suggest.

J. O. B.—Your No. 2 is most charming, and speaks well for the work done with your hand-camera. You do not say what lens you are using. We shall certainly retain the prints. We cannot fix a date, but shall start on the work directly after Easter.

HYPATHIA.—"Hardcastle Crags," we suppose you have a thin negative. Your print would be much improved if printed in a dull light, or you may filter the light through tissue paper. You have no detail in the shadows at all. "Castle Carr" is a better print. Your "interiors" are not good in St. Edward's; you would have got a much better picture had you backed the plate, and so prevented halation. You give no particulars as to exposure, stop, etc.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within two days of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill London, E.C.

Apparatus.—For sale, quarter-plate Instantograph, with lens, shutter, tripod, four double dark-slides, and case, 35s.; also a splendid Optimus R.R. lens, 5 by 4, with stops, cost 34s., take 25s.; a bargain.—Address, T. L., 11, Eton Villas, Crown Hill, Harlesden, N.W.

Bicycle.—Exceptional bargain. Buckingham and Adams' light safety bicycle, fitted with bell, tool-bag, etc., balls all over, hollow rims, splendid luggage carrier, made specially for half-plate camera, just the thing for an amateur photographer; cost £18 10s.; price only £9.—B., 2, Oak Villas, Friern Park, North Finchley, N.

Burnisher, Lens, etc.—Useful 9 in. burnisher, as new, 9s.; excellent c.d.v. lens, 15s.; splendid cabinet for microscopical objects, with slides, 15s. — Jones, Enfield House, Uffculme, Devon.

Camera.—Lancaster's quarter-plate Instantograph, complete, canvas bag, perfect condition; 30s. — Graham, Barnoch, Harrow.

Cameras, etc.—Rouch's patent camera, half-plate, three double dark-slides, and canvas case to contain the lot, camera has double swing and reversing back, perfect condition; price 70s. lowest.—Sydney Miller, 23, Highbury Grove, Islington, London.

Lancaster's quarter-plate special camera, with one double back, and changing box and back for twelve plates, and landscape lens, £2; Rouch's dark-tent, with tripod, new condition, £3; Beck's 5 by 4 R.R. lens, with Iris diaphragms, £2 12s. 6d.—Dollery, 57, Charing Cross, S.W.

3½ by 3¼ bellows camera, swing-back, folding tail-board, lens, slide, changing box for 12 plates, lantern size, new, 30s.; also Jefferies' half-plate print washer, 7s. 6d.; no approval. — James Taylor, 7, Gowan Street, Arbroath, N.B.

Camera, quarter-plate, swing-back, rack focus, six Blair's feather-weight slides, canvas case, new, compact, light; 45s.—8, Midland Road, Gloucester.

Camera, Hand-Camera, etc.—Half-plate McKellen camera, two double slides, three-fold tripod, price £7 10s.; 3B Suter lens, price £2 15s., condition almost new; Facile hand-camera, cost £3 13s. 6d., price £2 18s. 6d. — 6, Montford Place, Kennington Green.

Camera, Lens.—Small pocket camera (by Wratten and Wainwright) and Dallmeyer lens, for pictures 2 by 2½, good as new; cost £9; offers wanted.—Glazebrook, Malling, Liverpool.

Camera, Lens, etc.—Square whole-plate camera, leather bellows, square, short focus, reversible swing-back, 9 by 7 Optimus R.R. lens, three double dark-slides, 1 dozen plates, £8 10s.; 124 numbers AMATEUR PHOTOGRAPHER, 36 numbers Philadelphia or Wilson's "Photographer" (no pictures), 11 numbers "Camera" of 1883; 30s.; or exchange large Kodak.—Camera, 95, Hill Street, Lurgan, Ireland.

Half leather bellows camera, all movements, and rapid Rectigraph lens; 70s.; lens cost £3.—Pollock, Telegraphs, Belfast.

Le Merveilleux quarter camera, rectilinear lens, etc.; particulars on application. — Fisher, 31, Womersley Road, Hornsey.

Good mahogany quarter camera and lens, takes pictures 10 by 8; £5; or what offers? — Edward Wood, 215, Abbey Hey Lane, Gorton, Manchester.

Camera, Slides, and Case.—Lancaster's half-plate special patent camera, latest improvements, three slides, perfect condition, also case for same; £4 5s. 6d.—Preston, Heath Cottages, Hebdon Bridge.

Dark-Slide and Photometer.—Single dark-slide, 10 by 8, 10s.; Decoudun's photometer, 5s. — Frew, University College, Dundee.

Enlarging Lamp.—Stanley's magnesium enlarging lamp, unused; low price; or exchange for 5 by 4 or quarter R.R. lens.—T. B., 8, Cologne Road, New Wandsworth.

Hand-Cameras.—McKellen's quarter-plate detective camera, patent 7432 and 2382, as sold by Marion and Co., fitted with Taylor's detective R.R. 6 in. focus lens, Iris diaphragms, cheap; £6.—D. R., 23, Ramsay Villas, Ramsay Road, Forest Gate, E.

What offers for Diamond hand-camera, nearly new?—Atkinson, Cumberland Road, Leeds.

Fallowfield's Facile camera, rectilinear lens, finder; cost £5 5s.; take £4; good as new.—Whiteside, St. Nicholas, Cardiff.

Lantern.—Magic lantern, 4 in. condensers, lighting slide holder; 25s.; quite new.—Smith, Junior, 76, High Street, Wavertree, Liverpool.

Lanterns, etc.—Exhibitors' biennial lantern, mahogany body, all brass fronts, with jets, tubing, lamp, case, new, and all complete; price £12.—Sparham Camp, Distillery Street, Norwich.

Hughes' patent Triplexicon three-wick lantern, 3½ in. condensers, in case, with Aphengoscope, and over 100 slides, English cathedrals, comic nursery tales, hymns, etc.; what offers cash?—W. Rushton, 71, Deardengate, Haslingden, Lancashire.

Lenses.—Optimus half-plate R.R. lens for sale; 40s., as new.—Middleton, 2 and 3, Aldgate.

Half-plate landscape lens, nearly new; 15s. — L. Lawton, Bank Top, Morley, near Leeds.

Ross' rapid symmetrical whole-plate lens, 90s.; Dallmeyer's No. 1 patent landscape ditto, 55s.; both new condition. Wanted, Ross' portable symmetrical 7 in. focus; also whole-plate landscape Dallmeyer or Wray, good condition.—Brownrigg, Ballymena, Ireland.

Whole-plate Instantograph lens, complete, 1883 pattern; 25s.; a bargain. — Benwell, 3, Headstone Terrace, Harrow.

Optimus 7 by 5 wide-angle portable symmetrical lens; cost 52s. 6d.; take 39s. 6d.—Hawkins, Waverley Estate, Farnham.

Rapid rectilinear lens (by Suter), 3B, covers whole-plate; 60s.—Summers, jun., 28, Cheapside, London.

Lenses, Taylor's 100s. whole-plate, mid-angle rectilinear, 7 in. focus, 65s.; Ross' 3 in. portable symmetrical, 35s., perfect.—8, Midland Road, Gloucester.

Optimus 12 by 10 R.R. lens, covers 15 by 12 plate, perfect, as new; £5 10s.—W. Charles, Duns, N.B.

Pair symmetrical stereoscopic lenses (by Trench), equal to new; cost £6 6s.; price £2 10s.—Pierston, 27, Dudley Road, Tunbridge Wells.

Lenses, Optimus rapid rectilinear, 7 by 5, nearly new; 35s. — H. C. A., AMATEUR PHOTOGRAPHER Office.

Lenses, etc.—Lancaster's quarter Merveilleux lens, stand, two slides, 18s. 6d. — F. Bean, Snaith, Yorkshire.

5 by 4 portrait lens, half-plate rapid rectilinear, large 5-cell battery, lamps, and bells; exchange for thoroughly good whole-plate camera, or sell separate.

—Rector, Trusthorpe, Alford, Lincs.

Lens, Camera, etc.—Dallmeyer's triple achromatic lens, whole-plate, 12 in. focus, £3 10s.; Marion's 1½ in. camera, 18s.—Verd, Mossigg, Cathcart, Glasgow.

Lens and Shutter.—Ross' actinic doublet lens, 8 by 4½, 55s.; sky-shade and shutter. — Arthur, 87, Augustine's Road, N.W.

Negatives.—Negatives, 50 quarter-plate, Indian views; 20s. lot; suitable for lantern slides.—Sparham Camp, Distillery Street, Norwich.

Sets.—Quarter-plate camera, with three backs, Wray lens with Iris diaphragm, folding mahogany tripod, Newman's shutter and finder, in leather case, complete; cost £10 15s.; take £6.—To be seen at 418, Strand.

Violin.—Violin, bow, case, chin rest, and tutor; a bargain, 15s. 6d. — W. Robinson, Bedford Road, Kempston, Beds.

WANTED.

Cameras.—Half-plate Instantograph camera, without lens or stand. — Photographer, Catherine Street, Devonport.

Lancaster's latest pattern half-plate Instantograph set, in excellent condition. Will exchange gentle-

man's splendid English silver lever watch; cost £5, and cash.—C. G. Hodgkinson, Billingborough, Lincolnshire.

Lancaster's quarter Instantograph, complete with extra dark-slides.—H. Dan, Faversham.

Cameras, etc.—Lancaster's half-plate Instantograph camera, complete; also 6 in. condenser, enlarging apparatus.—Thorold, Hougham, Grantham.

Half-plate Instantograph 1889.—Price and particulars to Wm. T. Ashby, 48, Colwyn Road, Northampton.

Camera Case.—Half-plate camera case, cheap.—Anderson, 49, Cheltenham Road, Clapham, S.W.

Camera case, leather, half-plate, reply stating price, dimensions.—F., AMATEUR PHOTOGRAPHER OFFICE.

Dark-Slides.—Quarter-plate camera, three dark-slides, good make, reversible back, cheap; apply by letter.—H., 33, Ladbroke Road, High Street, Notting Hill Gate.

Dark-slides, half-plate Instantograph; exchange.—M., 99, High Street, Gosport.

Hand-Cameras.—Facile on loan, April 3rd, 4th, and 5th.—F., 35, Bedford Road, Clapham.

Quarter Eureka detective, cheap.—C. Emanuel, 36, Finsbury Circus, London.

Hand-camera, in good condition, quarter-plate, complete with finder, Shew's Eclipse preferred; state lowest terms.—F. Taylor, Littleton, Evesham.

Lantern.—Lantern, complete, and good half-plate lens. Will give Hillman's tricycle, worth £8.—Kennett, Sandgate, Kent.

Lantern, etc.—Enlarging lantern, condenser at least 8½ ins., without lens; state price; full particulars. Also Ross' portable symmetrical lens, No. 4 or 5.—Address, Derrick, 2, Royal Crescent, Cheltenham.

Lenses.—A Ross or Dallmeyer half-plate R.R. lens in good order.—Stewart, Castletown Road, Dundalk.

Wide-angle quarter-plate lens, by first-class maker; half-plate won't do; must be perfect.—Box 25, Post Office, Bradford.

Lens, etc.—Quarter-plate R.R., any good maker; also Tylar's metal slides, for Lancaster's quarter-plate special camera.—State lowest prices to Clarkson, 30, Iona Place, Mount Florida, N.B.

"Pictorial Effects," by Robinson, cheap for cash.—Grant, Westholme, Tottenham.

Sets.—Half-plate camera, three double backs, rectilinear lens, modern make, cheap; state full par-

ticulars; approval.—Young, 30, Menzies Street, Liverpool.

Half-plate Instantograph, complete, with three double backs, first-class condition and cheap; particulars.—Pfeiger, 5, Plimsoll Road, Finsbury Park.

Slides.—Either one or two whole-plate double slides, cheap; particulars and measurements to Walford, 10, Soames Street, Peckham, London, S.E.

Sundries.—Quarter camera case, dishes, printing-frames, lamp.—Clark, 43, Coggeshall Road, Braintree.

A LARGE quantity of useful miscellaneous PHOTOGRAPHIC APPARATUS, including Cameras, Hand Cameras, Instantaneous Shutters, Stands, Negative and Bromide Papers, Plates, etc., will be included in Mr. J. C. STEVENS's next sale, on Friday, 28th inst. Catalogues may be had on application to 38, King Street, Covent Garden, where the goods may be inspected on the day previous, and morning of sale.

THE "AMATEUR PHOTOGRAPHER" FIRST LADIES' PHOTOGRAPHIC COMPETITION.

PRIZES.

First Prize	Gold Medal.
Second „	Silver Medal.
Third „	Bronze Medal.

(These Medals, of the smaller series, will be appropriately mounted as Brooches).

SUBJECTS.

Landscape or Seascape—Landscape with Figure—Genre or Figure Study.

CONDITIONS.

- Not less than six or more than twelve prints are to be entered for competition.
- All prints must be mounted, and the title (only) must be legibly written on the front of the mount.
- The work must be entirely the work of a lady, who must be a bona fide amateur photographer, and must have done all the work, except mounting, herself.
- The negative of the prize photographs must be at the service of the proprietors of the *AMATEUR PHOTOGRAPHER*.
- Photographs can be printed by any process, but must not be printed on opal, or mounted in optical contact on glass.
- All photographs must be sent in on or before the 31st of May.

7. No prints will be eligible that have been entered for any previous competition.

8. Entry forms will be forwarded on receipt of stamped addressed envelope.

NOTE.—The adjudication will be made by lady artists and lady photographers. It is hoped that it will be possible to make arrangements to exhibit the photographs at a *Conversazione* to be held in the offices, 1, Creed Lane, E.C., during the month of June.

Further particulars on application to the Editor, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

THE following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his *personal experiences*. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

Subjects.

28th March	Optics.
28th April	Action of Light.
28th May	Exposure.
28th June	Plates and Films: their Development and After Treatment.
28th July	Printing, Toning, Mounting, and Finishing.
28th August... ..	Artistic Effect and Composition.
29th September	Outdoor Instantaneous and General Photography

All MSS. to be addressed to the Editor, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE Proprietors of the *AMATEUR PHOTOGRAPHER* will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP),

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	June 14.
LANDSCAPE WITH FIGURE	July 14.
GENRE OR FIGURE STUDY	April 14 ... Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, — ANY MALS, ETC.	May 14 .. Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors.

In addition to the Medals being given, the prize photographs will be produced in the *AMATEUR PHOTOGRAPHER*.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Competitive prints are available for exhibition before Photographic Societies after the 1st of each month.

The prints will all be numbered, and when sent to societies, will be accompanied by a book for criticism. It is hoped that the President or other official will give a note stating the general opinion of the members of the Society.

Entry forms on receipt of stamped addressed envelope.

OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

MR. PIRIE has written us a long letter upon the work done, or left undone, by the Edinburgh Photographic Society. He suggests the establishment in Edinburgh of a society for amateur photographers. From our experience we are certain that there are scores of workers who would join a society on the lines of the Camera Club, with head-quarters in Edinburgh. The existing Photographic Society is an old one, has a large number of members, but very few active workers, to our knowledge. The officials never contribute any report to our columns or those of the PHOTOGRAPHIC SOCIETIES' REPORTER. We are favoured occasionally with a very meagre printed report of the proceedings, and we believe that some few communications find their way into the columns of our contemporaries. We should of course like to see an amateur society formed in Edinburgh, and would give it every possible support. The Leith society has been a success from the start, due in no small degree to the care that the executive have always taken to make known the doings of the society through our columns and the REPORTER. The Edinburgh Society is, we believe, excepting perhaps the Camera Club, the largest in the world, and it is a fact that it contributes less to aid photographers and advance photography than any other society. We hope our readers will follow the suggestion in Mr. Pirie's letter, and that active steps may be taken to form a society, in order that a suitable "home" may be found, and everything got into good working order before next winter season.

* * * *

A SUBSCRIBER, Mr. Walter J. Davies, has kindly sent us an album of photographs, his own work, to be given to a hospital. The photographs are all carefully mounted and titled, some of them being accompanied by a brief description; on the opposite page short poems and Scriptural texts are carefully written, many of them having some special bearing upon the scene photographed. This addition to the album increases the value considerably. We would suggest that the enthusiastic amateur photographer prevail upon "his sisters, his cousins, and his aunts" to

seek for appropriate quotations from the classics and modern poets, for the photographs in the securing of which he devotes so much time and ability, thus giving an additional interest and affording a useful and instructive occupation for many a "leisure hour."

* * * *

A VERY interesting lecture upon "Celestial Photography" was recently delivered before the members of the Colchester Camera Club and others, by the Rev. E. Ledger, Gresham Professor of Astronomy. A summary is given in the current issue of the PHOTOGRAPHIC SOCIETIES' REPORTER. To the student the lecture will be of great value, and to the photographer it opens up new fields of work.

* * * *

WE are pleased to notify that, mainly through the exertions of Surgeon-General A. H. Beaman, an Amateur Photographic Society has been formed at Bedford. A short report of the opening meeting will be found in another column.

* * * *

THE AMATEUR PHOTOGRAPHER may be said to have fairly fulfilled the intentions of its founders, but there would appear to be a large field in which to extend its usefulness, and to that end it is intended to appoint "District Editors," who shall have the charge of a certain number of photographic societies, and attend the meetings on behalf of the AMATEUR PHOTOGRAPHER and the PHOTOGRAPHIC SOCIETIES' REPORTER. We shall hope to have "districted" the United Kingdom before the winter season comes round, sufficiently to have every photographic society in touch with our "District Editors." The reason of this step is to secure popular reports and chronicle the doings individually and collectively of the hundreds of ladies and gentlemen who are now interested in photography. Our "District Editors" will encourage and assist the formation of new societies, and help in the interchange of thoughts and ideas, bringing members of different societies closer together. It is intended that as far as possible they shall be identified with

For Contents, Prize Competitions, Notices, etc., see page 248.

the local Press, and we shall be glad to hear from our subscribers of gentlemen who are Press men and photographers.

The "districting" of the United Kingdom will be the work of some months, and will require considerable organisation; but we feel that, as the AMATEUR PHOTOGRAPHER has been the sponsor for all the later photographic societies, it is our duty to strive to bring about a system of "districting" that will help each society, and tend very much to advance photography throughout the kingdom. We have had much experience in the loaning of photographs and lantern slides during the last six months, and have had ample opportunity of learning how desirable a system of "districting" has become. Each "District Editor" will contribute short reports to the AMATEUR PHOTOGRAPHER of the societies attached to his centre, and more exhaustive reports for the REPORTER, so we shall hope to secure particulars of all societies, great and small.

* * * *

At the moment of going to press we have received a notification from the Crystal Palace authorities that the "Silver medal given by Mr. S. G. Buchanan Wollaston for the best picture, irrespective of class, in the Amateur section, not having taken an award in the Exhibition," has been awarded to Mr. Paul Lange for "A Tour in Norway," contributed to the AMATEUR PHOTOGRAPHER "Prize Tour Competition." The award will carry with it an extra AMATEUR PHOTOGRAPHER Gold Medal. The remaining pictures entered in the Prize Tour Competition will be adjudicated upon this week, and the full list of awards published in our issue of the 11th inst. The "Silver medal given by Mr. J. F. Peasgood for the best picture, irrespective of class, in the Professional section, not having taken any other award in the Exhibition," has been awarded to Mr. F. Whaley, for "A Tale of the World." A "Special silver medal for a picture not previously shown at any public exhibition" has been awarded to Mr. E. C. Middleton, for "Gossips."

The following are the awards for lantern slides entered for competition at the Palace:—

LANTERN SECTION.—BRONZE MEDALS.

Professional Section.—Set of 48 Slides.

Section	1.—British subjects	J. Dore.
	2.—Foreign "	G. E. Thompson.
	4.—Microscopic	F. Evans.
	5.—Statuary	Sciopticon Co.

Amateurs.—Sets of 6 Slides.

Section	1.—British landscape	F. Griffiths.
	2.—Foreign views	A. Heywood.
	3.—Seascapes	F. W. Wade.
	4.—River and lake	J. E. Austin.
	5.—Architectural exterior	E. A. White.
	6.—" interior	J. A. Sinclair.
	7.—Still life	J. Carpenter.
	8.—Animals	K. L. Reynolds.
	9.—Figures in motion	H. Little.
	10.—Microscopic	A. A. Carnell.

Out of this list we note with feelings of pride that of the ten prize winners in the amateur section, three, Messrs. Austin, Reynolds, and Little, were successful in the AMATEUR PHOTOGRAPHER Lantern Slide Competition; and of the ten prize winners seven entered our competition.

* * * *

We shall be glad to hear from any of our readers who may have suggestions to make with regard to the

"AMATEUR PHOTOGRAPHER Annual." It is hoped that in another month or so the active work of compilation may be put in hand. The issuing of an Annual has been pressed upon us ever since 1885, and we shall do our best to bring out something which is both new and true.

* * * *

THE LIVERPOOL 1891 EXHIBITION.

THE scheme of the proposed exhibition to be held in Liverpool in March next year having been fairly launched, we hasten to give our first impressions relative to the venture. That the show will prove an unqualified success there can be little doubt. The Liverpool Amateur Photographic Association, under the auspices of which the exhibition will run, is not only strong numerically, but it includes many members of acknowledged ability and experience, and to these qualities may be added those of vigour and enthusiasm. The scheme has been under the official consideration of the Council of the Association since February last; the preliminaries were laid before a general meeting of the Society on the 27th ult., and, to put the matter concretely, were adopted with the utmost cordiality and unanimity. This auspicious opening has, of course, a significance which cannot be well over-estimated, especially when the circumstances affecting and the brilliant success attending the Liverpool show of 1888 are considered. Since that time the Association has strengthened wonderfully, gaining in life, talent, and energy.

As in 1888, the show of 1891 will be held in the Walker Art Gallery, and here the Liverpool Society have the advantage of a suite of rooms perhaps the finest for an exhibition of this kind, in Great Britain. We publish an outline plan of the rooms for the benefit of our readers.

The dimensions of the galleries are:—A, 66 ft. by 36 ft.; B, 62 ft. by 30 ft.; C, 22 ft. by 22 ft.; D, 65 ft. by 26 ft.; E, 72 ft. by 35 ft.

In addition to the galleries which will be occupied by the exhibition, the Walker building includes several other spacious rooms, containing the permanent collection of Corporation pictures. These, as will be noted in the case of the exhibition galleries, form a continuous series. During the time the exhibition runs—four or, perhaps, five weeks—special arrangements will obtain with regard to the admission of the public in both sections. The excellent cellarge of the building will be at the disposal of the

Society for the storage of exhibits one month before the exhibition opens. In this department the "hoist" indicated in the above plan will prove invaluable.

Thus far the scheme has everything in its favour, but much more remains to be said of the adjuncts which it is believed will have a large share in influencing the success of the show.

It is intended that the exhibition shall be attractive and popular to the outside public, novices, and the rest, as well as being a show which will command the confidence and co-operation of amateur photographers both at home and abroad. It is intended to combine the useful and practical with the pleasurable and ornamental. Galleries B and E are to be utilised as lecture and demonstration rooms, alternately or simultaneously occupied every evening. The lecturers will be selected from the front rank of authorities, the subjects treated to range over a wide field.

The same appreciation of what is essential to an exhibition satisfactory to all parties has been shown in the consideration of exhibits, adjudications, and awards. A new feature, that of encouraging exhibits from the colonies and abroad, is likely to prove a good experiment. Exhibits without frames may be sent cheaply packed in boxes, the executive undertaking to supply frames at their own expense. Competitors in any and every class need fear no unfair or disadvantageous classification. Thus "medal pictures," "trade exhibits," "quasi amateur work," &c., &c., will each have a distinctive class assigned them, as will work that is solely and purely amateur, and solely and purely professional. This is an important step in the right direction, the significance of which will be obvious to all who have had experience of past exhibitions.

It is intended that the Liverpool show of 1891 shall offer a fair and square field of competition, in which exhibitors will be treated with all generosity consistent with absolute impartiality. The adjudicators will be selected from the best judges (acknowledged) of photography, whose names when they are published will be a guarantee of competence and all-round fitness for the office.

Such is the broad outline of the scheme recently adopted by the Liverpool Amateur Photographic Association. That the Society contains the men to carry the project to a triumphant issue is well known. We might mention many gentlemen, members of the Liverpool Association, whose names are amongst the most familiar and weighty in the photographic world. Those of Mr. Paul Lange and Mr. Thomas Mayne come readily to the mind. Both gentlemen are prime movers in the scheme under notice. They are ably supported, and bid fair to eclipse their best efforts in the past—prominently successful as these have been. Meanwhile, together with the Council of the Society, they have the complete confidence of their nearly 300 fellow-members. The great show will be awaited with increasing interest.

URANIUM INTENSIFIER.—A correspondent writes:—I have tried this intensifier; it seems to act differently with different plates, giving generally much hardness and lumpiness. It is a pity the describer of this process did not state how reduction may be best effected in case of over-intensification. Some time ago I tried the magnesium mixture given in the *Moniteur de la Photographie*, and quoted in your issue of March 7th. I found it very uncertain and even apt to die out before wholly burnt, possibly owing to the quality of the magnesium powder.

Letters to the Editor.

WHAT PHOTOGRAPHY WILL NOT DO.

SIR,—Capt. Abney, who is a recognised authority on photographic subjects, has assuredly overshot the mark when he comes to tell us what photography does not do—as yet. We all know it will not give pictures in colours, but what should have induced this well-known scientific man to take a pessimist view of the possibilities of scientific progress in the future, just at the very instant when a German chemist has gone very far on a similar road to that which the Captain himself has traversed, it is impossible to understand. Why should Captain Abney prophesy that such a discovery as a process of photographing in colours will never be made?

In chemistry some new formula is discovered or invented every day. And since the days of Isaac Newton, knowledge on matters of science relating to light has much advanced. Who could have prophesied that photography would have been a possible *fait accompli*, before Newton's time, any more than the application of electricity to lighting or locomotion, before that of Franklin. On the contrary, the prophet who a hundred years ago would have declared photography impossible, would cut the same sorry figure that Capt. Abney must cut himself if ever the knowledge of the power of light and its chemical action, in reproduction of colours, should eventually also become an accomplished fact. Capt. Abney may be disappointed with the results of his own experiments in that direction, and it may be, as he says, in a century the Edison of photography will be born, but as I believe in a continually growing progress of scientific knowledge and discovery, I can only hope that the renowned Captain may live long enough to see this desired result—however far off as yet—of transmission of colours by light, and acknowledge his error.—I remain, sir, etc.,

L. M.

* * * *

TOUCHING UP.

SIR,—Might I here mention a point which a further knowledge of the chemistry of the process somewhat affecting the *modus operandi* has called to one's attention.

The chemical action involved on application of the KCN is, I take it, roughly the formation of potassic argentic cyanide; this double and white salt being readily soluble in water, of an unstable nature, and tending to reduce in presence of organic matter into cyanate, which latter, with some hydro carbon, is presumably the yellow stain of one's earlier experiments.

Hence the lesson our chemistry teaches us is brush water-wash at once in every case, and thoroughly, thus obviating any likelihood of after surface discolouration at, may be, some later date.—I am, Sir, yours,

A HUMBLE MEMBER OF THE CRAFT.

March 24th, 1890.

* * * *

OBER AMMERGAU.

SIR,—I can get all ordinary particulars as to route from Messrs. Cook or other agents, but what I cannot learn is anything about photography on the way or at my destination.

I chose my route several weeks ago, *via* Harwich, Rotterdam, steamer on the Rhine from Cologne to Mayence, thence by rail to Nuremberg and Munich.

I should like to know if photography is permitted in Germany, and regulations as to Customs duties, etc., and whether English plates can be got *en route*, at reasonable prices and in good condition.

Possibly some kind correspondent may reply to the query you were good enough to insert for me.—Yours, etc.,

March 26th, 1890.

EDWARD J. POPE.

* * * *

THE PHOTOGRAPHIC SOCIETIES' NATIONAL CHALLENGE CUP.

SIR,—In reply to the letter in your last number signed by Mr. Edgar G. Lee, we append the following copy of a letter addressed to that gentleman some days before the opening of the Exhibition.

We venture to think that your readers will conclude that in offering to allow the Newcastle Society to substitute other pictures for those which had been previously shown, and

medalled, at the Crystal Palace, we did even more than they had a right to expect.—Yours faithfully,

S. G. BUCHANAN WOLLASTON.
J. FR. PEASEGOOD.

Crystal Palace, S.E.,
March 28th, 1890.

"Crystal Palace, February 26th, 1890.

"Edgar G. Lee, Esq.

"Dear Sir,—Your papers duly to hand, and we are much obliged for the great care you have taken. We must point out that Mr. Gibson has included two pictures with the same title as previously sent; also Mr. Lyd. Sawyer has sent again "The Boat Builder," though shown here in 1888, and "The Castle Garth," shown here last year. As we cannot admit pictures more than once, perhaps they would like to substitute others.—Yours truly,

J. F. PEASEGOOD."

* * * *

AMATEUR PHOTOGRAPHIC SOCIETY FOR EDINBURGH

SIR,—The letter by Jas. Crighton in your last week's issue but confirms me in the views which I expressed in my last communication. In the first place I was unaware that the subject had been raised before, and the fact that it was "disposed of" two years ago does not affect the present movement. Amateur photography has grown immensely since then. It is encouraging to me, however, to know that the complaint I gave vent to is not a new one, and the Edinburgh Photographic Society might be convinced by these renewed expressions of discontent that there is something wrong with the method of conducting business.

Mr. Crighton cannot dispose of me by saying that I have no personal experience of the matter because I am not a member of the Society. The reason I am not a member of the Society is that it is not worth joining. I went to one meeting to see what it was like, and I found a gentleman, *not a member*, contributing the practical part of the proceedings, while what the members contributed was utterly worthless. Not even a professional was able to say a word which anyone would care to remember. On that evening there was what is called an exhibition of apparatus. What took place was unseemly, and if it had been reported I fancy the Edinburgh Society would have whistled long before they would have fetched makers of apparatus to another exhibition. Imagine the Secretary of a society, to whom valuable goods had been consigned, turning them out helter-skelter on a table, and then suggesting that they should be kept till next meeting. I was not at the next meeting, and cannot therefore say what articles were left to be inspected at it.

I know that the Society is largely amateur, and that its office-bearers are nearly all amateurs; but with all these advantages the Society is not a working one, and the cause I attribute to the presence of professionals. Amateurs are not, as a rule, particularly well up in their art, and it is against reason to expect that, except they be of a very forward disposition, they will get up in a meeting and advertise their weakness in the presence of gentlemen who have the whole subject at their finger-ends.

If it be replied that the amateur may learn from the professional, my answer is that that is as unreasonable an expectation. The professional cannot assume the role of teacher, for two reasons. In the first place he might divulge something which is of value to him, and in the second place he would be charged with monopolising the time of the meeting if he were always speaking.

The only remedy is to be found in a separation of the classes. Let professionals meet together, and discuss their work, and let amateurs by themselves help each other.

A good example of how the two systems work is to be found in this neighbourhood. In Edinburgh the society is mixed, and its proceedings are seldom worth noticing in the pages of the photographic journals. There has scarcely been as much as a paragraph in the AMATEUR PHOTOGRAPHER during the past winter. In Leith there is an amateur society which is doing good work. Its meetings are regularly noticed, and during the past year two of its members have gained AMATEUR PHOTOGRAPHER medals.

If Mr. Crighton replies to this letter he might say when the last prize was won by a member of the Edinburgh society. He might also say what the membership is, and what the average attendance of members.

I could write much more, but this letter is already too long. I am pleased to see that I can count upon the support of Mr. M'Phail, and I hope you will allow in your columns, for a few weeks, an expression of opinion, and thereby assist us in accomplishing our purpose, which is to found in this city, that is teeming with artists, an active and, I trust, a flourishing amateur photographic society.—Yours, etc.,

JOHN PIRIE.

* * * *

EXPERIMENTS WITH OXYGEN CYLINDERS.

SIR,—With reference to the account of experiments, in the *Glasgow Herald*, on the cylinders, copied in your issue of the 21st inst., I think it would tend to place the estimate of security on a sound basis if the Secretary of the Company would be kind enough to answer the following questions:

(1) What is the strength per square inch of sectional area of the mild steel used for the cylinders, as tested in the way that steel is usually tested before being used for boiler-making or bridge-work? The maker of the steel can usually furnish this.

(2) How was the cylinder purposely burst, in the experiment named when the portions was found to be cold?

(3) Is there any evidence of the burst cylinder which caused the fatal accident having contained a mixture of oxygen and hydrogen, other than the alleged fact of the portion being found to be hot?

(4) The above named gases when mixed do not explode, unless something is present to cause chemical combination. Is any theory to account for such combination offered?

(5) What was the pressure in the cylinders experimentally allowed to drop and otherwise tested? They are said to have contained the *full quantity*, except that containing liquid carbonic acid.

In this last case, and in the others, the pressure would depend on the temperature, and the data therefore are insufficient to prove anything, except the ductility of the steel, which seems good.—Yours, etc.,

GEO. M. SEABROKE.

March 28th, 1890.

* * * *

YELLOW STAINS ON BROMIDE PAPER CAUSED BY HYDROQUINONE—WHAT REMEDY?

SIR,—As the above is frequently cropping up in your Query columns, I take this leave of making known the following remedy, which I have found to act excellently, written by Mr. Horace H. Roden, and taken from the "British Journal Almanack," page 416:—"Dissolve in 1 oz. of water 20 grs of potassic iodide, and add to this 1 grain of auric terchloride. The resulting fluid is of a deep brown colour. To use this, add sufficient water to make the resulting mixture of a pale sherry colour, and immerse the print therein after well washing. The back of the print will rapidly assume a blue tint, due to the formation of starch iodide, and this will gradually deepen in colour, eating its way (visibly) into the weaker portions of the film. The yellow portions darken, but slowly and finally assume a reddish-purple tinge. At this stage the print should be removed from the dish. Soaking in cold water for an hour or so will remove all the blue tint, and the print will be found to be intensified throughout, and the yellows altogether disappeared."—Yours faithfully, W. E. REYNOLDS.

* * * *

LOAN OF LANTERN SLIDES.

SIR,—About eighteen months ago I promised to lend a box of quarter-plate negatives to brother amateurs, suitable for lantern-slide making, little knowing at the time what a number of requests I should have for them. The original box that I sent out is now again in my possession, having only been round to half the people who applied for the loan of it, but I am sorry to say during the time it was out, either from careless packing or carelessness on the part of the Post-office officials, over twenty negatives have been either broken or scratched beyond recognition. Under these circumstances I am obliged to withdraw the box from further circulation. I have had many letters of thanks from those who made use of my negatives, which have been very gratifying to me, but as there are still a great number on the list who are doubtless still waiting for the box, I should be much obliged if you would kindly insert this letter.—I am, etc.,

March, 29th, 1890.

WENTWORTH A. J. CROKE.

BLACKWOOD'S PHOTOGRAPHIC LENS.

SIR,—I noticed in your paper about three weeks ago an article on a patent by Mr. Blackwood for altering focus of lenses. I shall be glad of a little further information about same. I have an 8 by 5 R.R., by Beck, and I want to make it into a W.A. lens of about 4 to 5 inch focus. About what number convex and concave lens (uncut optic) ought I to insert in mount? I have tried, rather unsuccessfully, one or two such glasses, for although I can diminish focus, I find that the more I do so the more is the flatness of field sacrificed. I can get the short focus by a very weak double concave with somewhat stronger convex. But would it answer better to have a strong concave with a stronger convex? I want some number to start from, for the concave, and, of course, could then add convex glasses of such strength as was necessary. At present I can ring the changes on the various numbers of either. And ought the concave to go in front of convex?—Yours, etc.,

March 24th, 1890.

A. CORNISH.

* * * *

ALPHA PLATES.

SIR,—I am glad to see the letter in this week's AMATEUR PHOTOGRAPHER complaining of the finger marks (for that is what I believe they are) on the Ilford Alpha lantern plates. I have been very much annoyed by this defect, and so have many of my friends that have used them. I like the plates very much, but I have invariably found out of every packet there are several damaged by finger-marks. It greatly adds to the expense to have to make fresh slides for the faulty ones.—Yours, etc.,

144, Commercial Road,

CHRISTOPHER J. KIRBY.

Peckham, S.E., March 29th, 1890.

SIR,—In reference to the lantern Alpha plates as complained about by Mr. A. H. Livingstone in your previous issue, he is not the only unfortunate individual having such defects. I had out of a packet, using eight plates, three bad, one with rather a large spot. They give, as he says, nice warm tones.—Yours truly,

T. H. LYELL.

Lewes.

SIR,—My experience of the Alpha lantern plates tallies exactly with that of Mr. Livingstone. Last December I determined to try these plates, and, fortunately, bought a single packet as a sample. Every one of the dozen turned out like the specimen I enclose herewith.—Yours truly,

E. STEP.

The Mays, Epsom, March 28th, 1890.

NOTE—Undoubtedly spoilt with finger marks on the emulsion.—ED: AM: PHOT.

* * * *

ISLE OF WIGHT.

SIR,—Your correspondent, Mr. W. F. Jones (page 184) did well, in answering the query of "Nero" (page 163), to recommend Rayner's Temperance Hotel, Ventnor. But, as all amateur photographers are not teetotalers, I beg your leave to recommend, with equal confidence, two other hotels in Ventnor, viz., the "Crab and Lobster," about three minutes' walk from the railway station, and the "Queen's" Hotel, on the Esplanade. The early-rising amateur, who puts up in the latter, may take seascapes from his bed-room window. A photographic dark-room has been fitted up for the use of amateurs staying at any of these three hotels, which is situate about an equal distance from all of them.

Ventnor is certainly the best place on the "Island" in which the artist can take up his temporary abode. It is situate in the centre of the best scenery; Bonchurch and the "Landslip" on its eastern side, and the far-famed "Undercliffe" to the westward, while other points of interest can be easily reached, either by railway trains, which run frequently during the day, or by the numerous four-horse coaches which, starting from Ventnor as a centre, are just commencing their daily excursions for the season.

I must not omit to mention that meteorological observations, extending over a long period, show that Ventnor enjoys in early spring an exceptional amount of bright sunshine.—Yours faithfully,

VECTIS AMATEUR.

PHOTOGRAPHIC SOCIETY FOR THE POTTERIES.

SIR,—Will you kindly allow me, through your valuable paper, to reply to Mr. Powell's letter on the above subject, which appeared in your last issue. There may be no such Society in the Potteries, and judging from the heading, he does not wish to form a Society in the Potteries, so much as for the Potteries. Messrs. Powell and Hewitt, perhaps, are not aware that there is already a Photographic Society for the Potteries, under the name of the Newcastle (Staffordshire) and District Amateur Photographic Society. By the word "district," we undoubtedly mean the pottery towns, for although Newcastle is not really in the Potteries, yet we are almost surrounded by the Potteries, and every one of the pottery towns is within easy distance of us. Again, about three-fourths of our members come from the Potteries, and several from the town mentioned in Mr. Powell's letter, namely, Burslem. Taking all into consideration, I think it would be a bad thing to have two societies so close together, and would advise Messrs. Powell and Hewitt and any other amateurs in the district, to let me have their names as candidates for membership of our Society. I shall be pleased to hear from Messrs. Powell and Hewitt on the above subject. Any information respecting our Society may be obtained from our Vice-Presidents, viz., Mr. W. E. Leek, Newcastle, Staffs.; Mr. Thomas Stanway, Caudon Road, Hanley; and Mr. H. E. Whytehead, Tramway Depot, Stoke-on-Trent, or from, yours faithfully,

W. WILBERFORCE BEACH (Hon. Sec.)

The West Brampton, Newcastle, Staffs.

March 31st, 1890.

The Complete Photographer ;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

BY H. P. ROBINSON.

CHAPTER VII.

EXPOSURE.—(Continued from page 194.)

PUPIL.—Before you develop the negatives, I should like to get to the bottom of some mysteries that puzzle me. To begin with—Why must I focus with the same stop as that used when the plate is exposed, when removing the stop would give me more light to focus with?

PHOTOGRAPHER.—Because, in my opinion, with different sized apertures, the focus is not in the same place. I have read a much diagrammed mathematical nightmare, which demonstrated that this is theoretically impossible, but I feel right, in this instance and for practical purposes, in trusting the evidence of my own senses. Suppose we have a demonstration all to ourselves. We will take the 15 by 12 camera and rectilinear lens, because these things are more visible with large lenses. We will set up three objects; pages of advertisements on white paper with large type will do, one nearly behind the other, but all visible from the camera. The first shall be 25 ft. from the lens, the second 30 ft., the third 35 ft., using the full aperture. Focus carefully on the central object, the 30 ft. Now, what do you see?

PUPIL.—The letters on that object are quite sharp, and the other two are much out of focus.

PHOTOGRAPHER.—Now I will insert the $f/23$ stop.

PUPIL.—The central and most distant objects are in focus, but the nearest object is nearly as much out of focus as before.

PHOTOGRAPHER.—That is what might be called ocular demonstration, and is worth all the theory in the world. The focus has shifted further away, and, in fact, sharpens the distance while doing little good to the foreground. It would not matter so much if the effect were reversed. It is not, indeed, a very serious matter in many cases, but it is as well to know what you are going to get. I found it out

this way. I had got a beautiful foreground of daisies, and focussed with full aperture so as to get the little white stars about 30 ft. away in focus, trusting to the $f/23$ stop to pull the others into sufficient definition; but on developing I found the nearer daisies were neglected by the focus, and the plane of sharp focus had advanced further into the scene. Of course, the first thing suspected was that the screen and plate did not fit into coincident planes. This was soon found to be a mistake, and further investigation showed the true cause.

PUPIL.—I think the case is proved. My next question is this. You said that $f/23$ is the smallest stop you use for

swing-back enables the photographer to dispense with small stops. I think I must give you a paragraph from one of his always clear and lucid papers, which contains nearly all you need know scientifically about focus:

"The aperture or diameter of stop also determines the amount of depth of focus, and this increases in the same proportion as the diameter of stop diminishes. Hence, twice the 'depth of focus' can only be had at the expense of four times the exposure. This originates with a law in optics—one that cannot be set aside—viz., that for every varying distance of the object from the lens there is a corresponding different focus also. Thus every point in an

H. BADEN PRITCHARD.
J. H. DALLMEYER.

R. T. CRAWSHAY.

DR. DIAMOND.
H. P. ROBINSON.

G. W. SIMPSON.

W. MAYLAND.

pictorial photography. Why is that, when a smaller stop would give better definition?

PHOTOGRAPHER.—I never care for excessive definition. In my opinion, extreme sharpness destroys vigour, roundness or solidity, and atmospheric effect. It is a great mistake to suppose, as I think I have already said, that experienced photographers crave for excessively sharp pictures, although such has been declared to be the fact by a young and inexperienced writer who has been carried away by the enthusiasm of ignorance. The demand has always been for the focus to be spread over the different planes so as to avoid painful sharpness on the one hand and equally painful blurring on the other. As the late Mr. Dallmeyer pointed out years ago, a proper understanding of the use of the

object out of focus is represented in the picture by a disc or circle of confusion, the size of which is proportionate to the aperture in relation to the focus of the lens employed. If a point in the object is $\frac{1}{100}$ of an inch out of focus, it will be represented by a circle of confusion measuring but $\frac{1}{100}$ part of the aperture of the lens; and when the circles of confusion are sufficiently small, the eye fails to see them as such; they are then seen as points only, and the picture appears sharp."

PUPIL.—I have no doubt that is very clear. I must think it over by myself. May I express my thankfulness that you don't often drop into science? One more question before we proceed. In the course of miscellaneous photographic reading I have gone through since we met so happily

in the railway carriage, I have been much interested in exposure tables. You, as an old photographer, may not want them, but would they not help a young beginner?

PHOTOGRAPHER.—As bladders a young swimmer, they would delay your progress. They are, as you say, interesting, but have nothing to do with our present purpose, which is one side of practical photography. These tables may be of use for enlarging and copying, but not out of doors. Nothing but experience will teach you picture exposure. There are so many things that go to the determination of the time of exposure. By aid of much arithmetic you may determine exposure sums as regards the equivalent focus and relation to it of the aperture of the diaphragm, and even square the sensitometer if you do not consider such a proceeding immoral, but there are other always varying conditions to consider; the light, the subject, your own mind, for you may decide that the result shall be either forcible or soft; all these things go to the making up of the exposure sum. Then again while you were making your calculations your subject may "softly and suddenly vanish away" as the Baker did when he saw the Boojum, as described in that good photographer, Lewis Carroll's wonderful "agony," "The Hunting of the Snark," the mention of which reminds me that there is in this delightfully insane poem some lines that exactly describe, though not intentionally, as you would suppose, the use of exposure tables. Here it is:—

"Taking three as the subject to reason about—

A convenient number to state—

We add seven, and ten, and then multiply out

By one thousand diminished by eight.

"The result we proceed to divide as you see,

By nine hundred and ninety and two;

Then subtract seventeen, and the answer must be

Exactly and perfectly true.

"The method employed I would gladly explain,

While I have it so clear in my head,

If I had but the time and you had but the brain—

But much remains to be said."

The sight of that book brings back the memory of old friends. I well remember buying it. It was at the Gloucester bookstall. We were a party of photographers returning from our annual spring visit to Mr. Crawshay, at Cyfarthfa Castle. Among us were Dr. Diamond, G. Wharton Simpson, H. Baden Pritchard, J. H. Dallmeyer, all gone now, as well as our host, the most enthusiastic of all amateurs, whose residence reminded one of feudal times. Their personalities were scarcely known to the present generation, but the names are still "familiar in their mouths." It is difficult for a present-day photographer to realise the enormous debt his art owes to the five names that have so casually cropped up. You will be interested in a group I will show you representing some of us. It was taken at Scethrog, Mr. Crawshay's fishing place on the Usk. I think it was Mr. W. England who sacrificed himself out of the group to do the exposing. The book kept us merry for the rest of the journey home. I suppose all the world, both young and old, have to thank the author of "Alice in Wonderland" for more delight than any other writer. Could anybody want a better record?

MARION'S "Practical Guide to Photography" has reached a fourth edition, and well deserves its success. It is one of the most comprehensive handbooks, at a low price, that we are acquainted with. It is fully illustrated, and deals with every process for the production of a negative, printing, toning, retouching, combination printing, and last, but by no means least, instructions, with clear illustrations, for cutting up the sheets of commercial sensitised paper.

Kambling Papers.—XI.

BY W. K. BURTON.

STORING OF SENSITISED ALBUMENISED PAPER.

I READ, some months ago—I forget now where, or by whom written—a very interesting paper on the effect of different substances in contact with common sensitised paper, in preserving it from destruction by spontaneous darkening. I was glad to see that my old friend carbonate of soda (common washing soda) came out best. I also saw a confirmation of a fact that I had often noticed, namely, that a sheet of ordinary sensitised paper, no matter how much discoloured itself, had a wonderful preserving action on fresh sensitised paper when used as a wrapper. This is a very useful fact to know. I wonder, however, that common "soda paper," the use of which has been so often described that it must be pretty well known to all, is not more common than it is. Any kind of paper that has not printed matter on it will serve. It has only to be soaked in a pretty strong solution of washing soda, and to be dried, when it is ready, and will serve indefinitely. It is commonly recommended that the sensitised paper be piled with alternate sheets of such soda paper with a weighted board on top, and this is certainly the best way in which to use the preservative, but it is wonderful how much the keeping qualities of sensitised paper are improved by merely wrapping a sheet or two of the soda paper round a roll of the silvered paper. This applies both to "ready sensitised paper" and to paper sensitised on a neutral bath. All this, however, is so well known that it is mere waste of space to say anything more about it.

What I wish is to point out a little thing in connection with the keeping of paper, either immediately after sensitising or in the case of ready-sensitised paper after purchase, that is, I think, not generally known. It is commonly recommended—indeed, I think I have recommended it myself—that sensitised paper, to preserve it, should be kept flat under pressure, as, for example, in a printing frame. Now I state, and this not without much experience and actual comparative experiments, that such paper keeps *very much better* if simply laid loosely in any box or drawer that is light-tight. I am speaking now on the assumption that soda paper is not to be used. Any one may satisfy himself of this by performing the very simple experiment of cutting a sheet of sensitised paper in two, cutting one half into, say, half a dozen pieces, and placing under pressure in a printing frame, and laying the other half loose in a drawer. The former will discolour much sooner than the other. The only objection to keeping "loose" is that the paper is liable to curl up.

I have kept untuned prints on "ready-sensitised paper" loose, as described, for over a year, and on ordinary home-prepared paper, for over a month in tolerably cool weather, without the faintest discolouration, but it is to be observed that *printed* paper keeps rather better than that which has not been printed. This can, I think, only be accounted for on the assumption that in the case of the printed paper there is some reduction of the silver salts even in the whites, and that the paper retains a certain amount of liberated chlorine in the pores, which acts as a preservative, but this is by no means a very satisfactory explanation, as there must always be excess of silver nitrate present. The following will illustrate the matter. A sheet of quite freshly sensitised paper is exposed under an opaque stencil till the exposed parts are *slightly* tinted, and is placed on one side in any dark place. As the paper spontaneously darkens it will sometimes—but by no means always—be found that the

unexposed parts of the paper darken so much more quickly than the exposed, that they soon appear of a darker colour. In the same way, I have sometimes found, in the case of a print taken from a negative showing very strong contrasts, and kept too long before toning, that the lighter details have assumed a *negative* appearance. It will be seen that the result of these experiments disproves the theory of the "continuing action of light" stated by some to take place in the case of ordinary sensitised paper, and, in fact, my experience is all against the existence of such continuing action.

THE USE OF OLD TONING BATHS.

I have recently seen it stated by more than one that, contrary to the statements commonly made in the text-books, the borax and other similar baths may be used over and over again. There is, I think, a complete misunderstanding in the case of those who make these statements, as to what is meant by the "keeping" of a toning bath. Of course, the borax bath or any other bath not supposed to "keep" will tone a second or a third time, or any number of times, if gold enough be added each time before toning to do the work, but this is not what is meant by the "keeping" of a bath. What is meant is, that the gold left over from the first toning remains unprecipitated, and is available for the second toning, and so on, not enough gold to do the whole toning being added, but only enough to replace what has actually been used up. Now those who describe the using of the borax bath over and over again, mention the *blackening* of the solution, and the necessity for filtering off this black precipitate. Now this precipitate is simply the gold that was left over from former tonings, and that is certainly *not* available for further toning. The way in which to find out whether a borax toning bath really will keep or not, is to make one up a good deal stronger than is necessary (stronger in gold), to tone, say, half the number of prints that it is capable of toning, to put it on one side for some time, and then to see if it will do more toning *without further addition*. I am not prepared to say that *quite the whole* of the gold goes down in such a case, but I know that the amount that remains in solution, in a form available for toning, is so slight that it need not be taken into consideration, at any rate if the intervals are more than twenty-four hours, as they generally are in the case of amateur work. Indeed, it will be found that, even in the case of the baths generally supposed to be permanent, such as the acetate bath, the greater part of the gold is very liable to be precipitated, if toning is done only at somewhat long intervals of time.

FALLING OFF OF TONE IN THE FIXING BATH.

It often happens—and there are few things more aggravating—that a beautiful tone* is got in the toning bath, but disappears in the fixing bath, leaving a muddy and wretched-looking print. This is a thing the reason for which it is not always possible to give, but there are one or

two causes that are commoner than others. They have already been many times described, but, as I still see frequent requests for an explanation of the phenomenon, I imagine that they are not as generally understood as they should be.

There are, I believe, two very common causes of defect. One is insufficient washing of prints before they are toned, the other is the use of an acid fixing bath. I know that it is often recommended—at least, when certain toning baths are to be used—that the prints be washed only *slightly* before they are toned. If this be done it will be found that they will tone very readily, but it is my experience that there will *always* be a falling off of tone in the fixing bath. I prefer to wash *very* thoroughly, or to treat with a weak solution of salt, which comes to the same thing. In some cases it will be found better to use a solution of carbonate of soda instead of salt. This depends much on the quality of the paper used, and on the colour that is wished.

Common hyposulphite of soda is often distinctly acid, and, if it is, a falling off of the tone in the fixing bath is almost certain to result. Moreover, the permanency of the prints is much endangered. It should be made a rule, never to be broken, that enough ammonia be added to the fixing bath to make it smell slightly, showing that all excess of acid has been neutralised.

(To be continued.)

Line-Light Working with Compressed Gases.

THE inconvenience arising from having constantly to adjust the requisite flow of the gases, owing to the continued fall of the pressures within the cylinder, may be dispensed with. An ingeniously constructed regulator automatically reduces the gases to a uniform pressure, yielding a supply equivalent to that given by the old-fashioned bag system.

The apparatus introduced by Mr. Clarkson is not unlike the self-feeding cistern for water supply purposes, with this addition that the tank is closed over with a flexible cover to the centre of which the arm of the ball-cock is connected. The action now becomes identical, as the effect of filling it with gas under pressure through the cock, will be to distend the cover and shut off the supply. On the other hand, supposing an outlet be made, the pressure would be released, the cover tending to return to its original position, to an extent that will sufficiently open the cock to maintain the pressure corresponding to the tension exerted by the cover, for any greater or less pressure would tend to close or open it respectively. This appears simple, but when pressures varying from 5 to 1,800 lbs. per square inch have to be dealt with, it is found that efficient regulation at the desired *low* pressure can only be obtained over a less extended range of pressures. To overcome this, two regulators are combined in a neat case forming a duplex system, in order that the defects in the action of one shall be corrected by having to pass the other.

Mr. Spurge, who is joint patentee with Mr. Clarkson, demonstrates the efficiency of this arrangement by means of pressure-gauges communicating with each side of the regulator, and using the ordinary lantern fittings. Dissolving is shown to be all that could be desired, the supply being promptly adjusted in accordance with the demand, and independent of the inlet pressure, and continued satisfactorily until the pressure in the cylinder is reduced to less than one-third of an atmosphere, which for practical purposes may be considered empty. A new form of burner has been invented which can be quickly changed into a blow-through or mixed jet by the turning of a handle; a kind of tap located at the base provided with a hollow handle, when turned upwards towards the nipple, supplies the second channel for the blow-through arrangement. By turning it away, this channel is closed, and another opened into a small chamber beneath the nipple, when it fulfils the condition for the mixed jet. This appears to work well in both instances, the change being rapidly effected.

Mr. Clarkson has also made an improvement in pressure gauges,

* It has been pointed out by Emerson that the word "tone" should not be used by photographers as it is, to indicate *colour*, as it is used in quite a different sense by artists—to express something that is generally called "gradation" by photographers. It is certainly a pity that a word which has a certain sense in referring to painting should be used with another technical meaning in photography; but I do not see why the right to a technology of their own should be denied to photographers, and, moreover, I do not know that Dr. Emerson suggests any other word to replace "tone" as used by photographers. Either "colour" or "tint" might certainly be used, but would be liable to be misunderstood, as each is already used in quite a different sense from that at present conveyed by "tone" in connection with a photograph. Moreover, the word "tone" has come to be so universally used to describe the particular process that is being discussed above, that it would probably be impossible to replace it by another now.

the object being to reduce the danger in the event of fracture taking place. The spring tube is filled with water and retained by means of a flexible partition located close to the inlet; a valve is also fitted in the passage communicating with the tube. This prevents access of the gas to the interior, and minimises the quantity of gas required to actuate it, which is afterwards easily expelled on account of the position of the partition. Consequently the gauge can be employed alternately for oxygen and inflammable gases without fear of danger, and again, should the spring tube break, the valve would instantly close the passage, and arrest any further flow.

The "Bijou" light, which is another novelty, is an adaptation of the lime light for microscopic work. It consists of a minute jet in combination with a stand condenser provided with the universal motion and a novel means of clamping. It yields a beam of white light, either convergent, parallel, or divergent, in any desired direction, and is retained by simply turning of a milled head. Mr. Clarkson has also made a new departure in the method of storing limes, which is certainly compact and cleanly to use, each lime being retained in a separate compartment, enabling any particular lime to be withdrawn without impairing the safety of the remainder.

We have no doubt that Mr. Clarkson will be pleased to give further particulars; his address is 28, Bartlett's Buildings, Holborn, E.C.

Our Contemporaries at Home and Abroad.

THE *British Journal of Photography*, in an article on "Rapid Exposures," says, "Our object is to protest against the exceedingly brief exposures that are so frequently given, when much longer ones might be made, and, in every way, much better results secured. In doing this we do not gainsay the fact that at times the utmost rapidity is imperative, as, for example, when taking a flying shot from the window of a railway carriage while it is at full speed, or in taking a vessel from the deck of another going in the reverse direction, or similar work. But for general purposes we unhesitatingly say that, in nine instances out of ten, of 'instantaneous' exposures, a much longer time might have been given without sacrificing sharpness through movement, and a far better negative obtained. . . . The most common fault with instantaneous work is not a visible movement, but under-exposure, which renders them worthless in a pictorial sense. If a negative be fully exposed, even if a slight movement is perceptible, it will be a far better picture than one with intensely black shadows devoid of all detail, such as result from considerable under-exposure. A very slight trace of blurring in the moving objects would, in a sense, be an advantage rather than otherwise, as indicating life which, as in the case of the railway train cited above, is not always consistent with the utmost sharpness." Articles: "The Action of Light on Silver Chloride," "Miniature Lanterns," "Printing by Electric Light," "The Art of Retouching," "The Sizes of Photographic Plates," "What Photography will not do."

Photography, in speaking of judges at photographic exhibitions, says, "They are few in number, and the judgment they form may not always be in accord with one another, or with the general sense of the public who visit the exhibition. If every visitor were a judge, the judgment formed would certainly most agree with the public sentiment. Such a method of judging and awarding prizes has been tried, and, we believe, has not been found wanting. It may be remarked that in exhibitions of other wares than photographs jurors are usually appointed after the exhibitors have exhibited their goods. The Camera Club also make suggestions, amongst which is that retouching should be declared. Unfortunately, as a rule, retouching requires no such declaration. There is retouching and retouching, some legitimate and some quite the reverse, but it will be hard to make a boundary between the two. Our own idea is that the work of art (!) usually speaks for itself, and the judges should be competent to distinguish the limit in each particular case. It would perhaps have been better, certainly more drastic, had it have suggested that no retouching at all should be allowed." Articles: "Medical Photography," "The Crystal Palace Exhibition," "The Camera Club Conference," etc.

The *Photographic News* says, "It is impossible to exaggerate the future importance of photography in regard to astronomical observations. At no distant date the world will be spotted with observatories all filled with photographic appliances, and all collecting records of the heavens, which will be of the utmost service when compared together. The latest additions to the world's observatories comprise one at the Vatican and one recently established by the Catholic Mission at Madagascar, where a building has been erected on a hill about 4,000 feet in height, and situated a short distance to the east of Tananarivo. The first-named, so far as astronomy is concerned, will concern itself principally with celestial photography. In the second a photographic telescope for solar observations will be provided." Articles: "The Invisible Photographic Image," "The Camera Club Conference," "On Differences of Colour-Sensitiveness of Different Times," "Severe Tests of Compressed Gas Cylinders," "Photographing a Speaker's Gestures," "Mounting Lantern Slides," "Children," etc.

A 1 for April contains two chapters on "Photography," in continuation of the lessons commenced in the new volume; one is devoted to "Lenses," illustrated by cuts of Lancaster's lenses, and reproductions of two good pictures taken by one of that firm's lenses. The other chapter is devoted to "Modern Appliances," and has reproductions of numerous instantaneous pictures. The remainder of the number is well up to the mark.

Amateur Work for April contains practical articles on "The Making of a Negative Washing Tank," and on "Detective Cameras."

The *Beacon* (Chicago), in an article on "Photographic Exhibitions," says, "We have repeatedly expressed the opinion that the only way by which photography as a profession can be raised from its present position to the platform which it ought to occupy, is the elevation of photographers themselves from photographers merely to artists in the true sense of the term. Photography will never attain to its rightful position till those who practice it cease to be content with pretty, nicely finished photographs; and not only aim at, but succeed in making each photograph a picture. In the present state of matters, however, so long as a certain degree of technical success in photographic practice is so easily reached, and the general public are sufficiently ignorant of art as to be satisfied with such productions, it would be unreasonable to expect much improvement; and thus we are met face to face with the fact that photographic advancement really depends on the art education and culture of the public." Articles: "A New Printing Process," "The Washington Convention," "The Optical Lantern," "On the Dangers of Flash-light Compounds," "Photography—Historical Sketch of its Past and Present," etc.

The *Scientific American* (New York), dealing with the question of smokeless powder, illustrates the difference between its effects and those of the ordinary gunpowder, by the reproduction of two photographs, taken by Mr. Paul Gers immediately on the word "fire." In the case of the volley fired with old powder the smoke hides nearly all the men, but where the smokeless powder is used there is very little smoke, and nearly the whole of the men in the line can be seen.

Anthony's Photographic Bulletin (New York), in its "English Notes," gives the following method of orthochromatising plates: "Buy a dozen of the slowest plates you can get—transparency plates are best. Then make up the following solutions:

- | | |
|---------------------------------|----------|
| I.—Ammonia | 1 drm. |
| Distilled water | 12½ ozs. |
| This is a 1 per cent. solution. | |
| II.—Erythrosin | 7 grs. |
| Ammonia | 1 drm. |
| Distilled water | 16 ozs. |

The erythrosin should be pure; the ordinary article sold as an 'eosin dye' may or may not answer well. Wrap two or three thicknesses of brown tissue paper round your dark-room lantern, and then immerse each plate in turn for two minutes in solution I.; then drain and transfer immediately to solution II., in which each plate may be allowed also to remain two minutes. Wipe the backs of the 'dipped' or 'bathed' plates, and stand them on strips of blotting-paper in a warm place till dry, which will not take long. Such bathed plates are far more sensitive to yellow and green light than ordinary plates. The dishes should be covered as much as possible while the plates are being bathed in them, and they should be screened from light of every kind.

Unfortunately, these orthochromatic bathed plates do not keep well; so it is not wise to prepare a large number at one time; but if used within two or three weeks they will be found all right. They should be given a full exposure, and during the early stages of development (any developer may be used, but it is better to avoid ammonia) the dark-room lamp should be covered with brown tissue paper." Articles: "Washington Convention of the Photographers' Association of America," "The Amyl Acetate Lamp and the Orthochromatic Gelatine Plate," "On Control in the Density of Negatives," "Distance beyond which all Objects will be in Focus with any given Lens," "Influence of the Process of Cooling upon the Optical Properties of Glass," "A Few Notes on the Factors which regulate Exposure," "Practical Interpretations of the Law of Conjugate Foci," etc.

The *Photographic Times* (New York) says, "Mr. James W. Dalrymple, of Solsberry, Indiana, has invented a self-operating apparatus for washing prints. The washer consists of a long pan, the bottom of which slopes up each way from the centre and works on pivots. The partition extends above the sides, so that the rocking motion of the washer causes it to play back and forth under the faucet, directing the water into each end alternately. The water glides down the sides of the partition and under the prints, keeping them off the bottom, while the rocking or falling motion of the washer gives the water an oscillating or rinsing motion, thus keeping the prints separated and exposed to the washing action of the water, which is continually changing. The operator sits at its sides with the trays of toning and fixing solutions. He takes the prints from one end of the washer, puts them through the solutions and then into the other end without disturbing the washing prints. It may be operated by a very small stream from a tank or barrel, its speed being regulated by the water supply." Articles: "A Home-Made Studio," "Cyanotype Transparencies," "Major Moulthrop," "Use Long Focus Lenses, or Trim Down Your Prints," "Finding the Focal Length of a Lens," "The Evolution of the Camera," etc.

Science Notes.

It is possible that in the new substance, named taxine, which Drs. Hilger and Brande, of Erlangen, have just succeeded in obtaining from the leaves, seeds, and young shoots of the yew tree, we may find a useful developer. It is a perfectly white powder, soluble in alcohol, but much less soluble in water. Dilute acid solutions of taxine precipitate gold and platinum from their chlorides; and even very dilute solutions have this power when ammonia or caustic alkalies are added. The probable chemical formula of the new substance is $C_{37}H_{51}O_{10}N$. It unites with acids to form salts, which are readily soluble in water.

The Exhibition held by the Royal Meteorological Society illustrating the application of photography to meteorology proved to be of a most interesting character. The earliest application of photography for this purpose goes back to 1838, when Mr. T. B. Jordan, of Falmouth, used cylinders covered with sensitive paper, which revolved behind the index of a barometer, and recorded the height of the mercury by the extent of the impression produced by light upon the exposed part of the paper. It will be noted that this was done a year before either Fox Talbot or Daguerre had made known their discoveries.

Professor Pickering, of the Harvard College Observatory, U. S. A., sent his Pole-star Recorder, a most ingenious yet simple arrangement for registering the amount of cloudiness at night. It consists of a telescope lens attached to a camera, and pointed at the pole-star. Plates are inserted, and the lens uncapped every evening after sunset; and the lens is capped again before daybreak the next morning. If the night has been perfectly clear, each star near the Pole-star will have left a record of its light on the plate in the form of a semi-circle; any breaks in this semi-circle will indicate the duration of time for which those stars were obscured by clouds.

A large number of really fine photographs of clouds were sent to the exhibition, of which seventeen large prints by M. Paul Garnier were probably the finest that have been seen in this country; another set of eighty taken during the past year by Padre F. Denza at the Vatican Observatory in Rome, bear testimony to the clearness and beauty of Italian skies. Dr. Riggensbach, of Basle, sent some photographs of cirrus clouds (most

difficult subjects) taken by reflection from the clear waters of the lake of Geneva, the water having acted as a polarising mirror and extinguished the glare of the sky light. This should lead to attempts to use polarising prisms in front of our lenses when engaged in securing cloud negatives.

The photo-micrographs made by Dr. Van Heurck, which were exhibited at the last meeting of the Royal Microscopical Society, are a distinct advance on all previous work. This is due to the fact that they were produced by one of the new apochromatic one-tenth inch microscope lenses recently produced at Zeiss's optical works, Jena, under the superintendence of Dr. E. Abbé. The aperture is the highest yet attained, being 1.6 N.A., the previous highest being 1.4 N.A., showing a clear gain of twenty per cent.

The Vienna correspondent of the *Standard* telegraphs some further details regarding a discovery of a method of photography in natural colours by one Herr Veresetz, of Klausenburg, in Transylvania. It is now stated that red, orange, and bright blue can be well reproduced, but not green. Dr. Eder is said to be "much impressed by the discovery." The photographs are said to have borne three weeks' exposure to diffused light without fading. But Niepce de St. Victor accomplished quite as much as this in 1855.

According to the writer of a paper in the March number of *Cassell's Magazine* (his name is Horace B. Jones, and the editor remarks that "the author is alone responsible for the statements therein contained"), there is now in San Francisco a Chinese priest who can cause the human mind to impress its ideas, photographically, upon paper—no lens required! The eyes of the person to be experimented upon are blinded, his hair is wetted, and a thin piece of white paper is pressed upon the top of his head. He is then commanded to think of some "person, place, or thing." The paper being removed, it is thrown into a vase containing what "seemed to be water," and is then dried over a lamp. If now examined, a picture of the object thought of is seen upon the paper.

Well! with the aid of a good thinker (*i.e.*, one who would think as we wished him), a few photographs of churches, people, etc., made on plain paper and rendered invisible by soaking in a solution of mercury, bichloride, and lastly a vase full of hypo, which would "seem like water," we think the trick could be easily reproduced. It is evidently the plan devised by Herschell forty years ago, and which had a great popularity under the name of "magic photographs," about half as long since. The mercury salt renders the photograph invisible, and the hypo restores it again.

At the meeting of the Royal Astronomical Society on March 14th, Professor E. C. Pickering read a paper on a "New Class of Binary Stars." During the past two years he has obtained more than seventy photographs of the spectrum of Zeta, Ursæ Majoris (one of the stars in the "Great Bear"). On comparing these photographs, it was found that the K line appeared double at intervals of fifty-two days, beginning from the 27th of March, 1887. For several days before and after the dates when the line appears double, it presents a very hazy appearance. The other lines of the spectrum are seen with difficulty when K is hazy and double; but several of them are certainly doubled when K is double.

The only satisfactory explanation of this phenomenon is that we are here dealing with a *double star* (a "binary"), whose component stars are too close together to be seen, or to be photographed separately. The twin stars must revolve round a point midway between them; and as they do so, one star approaches and the other recedes from the earth, causing the lines of their joint spectrum to separate. Professor Pickering calculates that the distance between these two distant suns is 143,000,000 of miles, and that together they have forty times the mass of our sun.

It is rather remarkable that many years ago Captain Abney stated in a paper which he read before one of the learned societies, that by photography it would be possible to determine the rotation of the stars. It was pooh-poohed at the time, but the thing has come to pass.

It is said that the secret of the almost perfect "correction" of the lenses lately made by Zeiss, is not in the use of the new Jena glass alone, but in the employment of *fluorite*, a mineral having lower refractive and dispersive indices than any optical glass hitherto produced. The world is to be searched for fluorite, clear specimens of which are excessively rare, and agents have already been despatched to Brazil, Chili, and Peru in search of this substance.

F. G. S.

Mounting.

BY ELECTRA.

As mounting is on your *tapis* just now, perhaps you may consider a few words of mine on the subject worth a small space.

With regard to "J. C. B.'s" mode of imposing the print (still adhering to the glass) on its mount, I think few could manage his plan without at the same time depositing some of the mordant on the card, pressed out from the edges of the print.

Besides the desirable qualities enumerated for a mordant, there is the further one that when dry it should not show on the mount in case of an accidental smear or excess. I have tried various mordants both bought and made by myself, and doubt if any is equal in all respects to starch, which when properly applied is most suitable for burnishing. It has the disadvantage, however, of rendering a print difficult to unmount.

The books mostly advise that the card should be bent round convexly (with reference to the right side), to allow for the contraction of the print. This has always seemed to me faulty in theory and unsatisfactory in practice. Either the print is unduly stretched and the mordant, already congealed, is disturbed, or the bending is futile, and the card on drying will present concave curvature. I mount my prints with the card already in the curved position which I obtain by keeping it in contact with the curved side of a semi-cylinder of hard wood (cut for the purpose), and imposing the print while it is in this position, pressing and rubbing down, and then putting aside to dry, when planitude resulted. Probably a strong bottle of large and uniform calibre suitably fixed would be an improvement on my wood block. Another thing also much recommended which never commended itself to me is the plan of mounting the prints while wet. In this state they are much more liable to injury from rubbing down, and the contraction is much greater than if first dried and then merely smeared with the mordant, thus causing much inequality of tension when drying, unless, indeed, the mount is also wetted, which is often not practicable.

Lastly, with reference to touching out specks of white and defects, from which few prints are wholly free, it is difficult to get satisfactory pigments. It is desirable to have something that will not wash off in water or come away under the burnisher—a feat to which some of the "spotting mediums," mixed perhaps with turpentine or some slower drier, are much given. I generally employ the *couleurs conventionnelles* sold in Paris, as these save much trouble in matching and mixing paint, adding, when about to use, a tiny drop of coaguline or white of egg. The result, however, is not always satisfactory; if much colour is put on, it is very apt to detach itself in the burnishing process.

It has been recommended also to touch the spots painted in with bichromate of potash, but this has not proved practicable in my hands. A great drawback to the use of the "mediums," etc., sold commercially is the sedulous concealment by the dealers of their composition; so that one never knows with what one is working.

Societies' Meetings.

BATH PHOT. SOC.:—A meeting was held on the 26th ult., Mr. W. Pumphrey (President) in the chair. Messrs. Bush, Isaacs, Lee, and Wood were elected members. The Hon. Sec. (Mr. Middleton Ashman) read a communication from the Mayor of Sutton Coldfield, anent the Norway excursion promoted by the Vesey Club. The Chairman, who intends accompanying the party, detailed the arrangements provided for scientific pursuits. All vacancies, he said, were quickly taken up, but Norway could be reached quite easily during the summer months, as three or four vessels constantly plied in that service. It was announced that the summer excursions would be resumed on the 24th of April, and a Sub-Committee to make arrangements was appointed. The Chairman drew attention to *Bladud* having printed the annual report; 250 reprints were ready for distribution. He wished to correct an error as to date. The publication of Daguerre's process should read July, 1839, instead of 1840, and it would be more correct to say that the neighbourhood of Bath was the scene of Fox Talbot's experiments. A lantern exhibition of transparencies produced by members of the Society during the past session then took place; Messrs. Pumphrey,

Bristow, Peacock, Perren, Powell, Maton, Wells, and the Rev E. A. Purvis contributed slides.

BEDFORD AND DISTRICT CAMERA CLUB.—At the first general meeting of this newly formed club, held in Bedford, on March 27th, the following gentlemen were elected officers for the current year:—Honorary officers, President, Dep. Surgeon-General A. H. Beaman; Secretaries and Treasurers, Messrs. A. Kirby and C. Perrott Smith. The club has been established for the purpose of advancing the study and practice of photography amongst its members by means of periodical meetings, lectures, excursions, and exhibitions. Membership is entirely confined to amateurs, and ladies are especially invited to join.

BRIXTON AND CLAPHAM CAMERA CLUB.—The first annual meeting was held on Friday, 28th ult., the President in the chair. The report of the Committee and the statement of accounts were read and passed. The President then entertained the members with an account of some of his experiences during a recent trip to Brittany, and showed the hand-camera used on the same, explaining the action of the shutter and the general working of the apparatus. At the next meeting on April 11th, other specimens of hand-cameras will be on view. The officers for the ensuing year are as follows:—President, Mr. A. R. Dresser; Committee, Messrs. Bartrop, Coade, Gorfin, Kent, Maile, and Powell. Hon. Sec. and Treasurer, Fred W. Levett, 126, Lowden Road, Herne Hill, S.E.

DEWSBURY AM. PHOT. SOC.:—A social evening was held on the 25th ult. The President, Mr. T. G. Beaumont, presided. About two hundred members and friends assembled in response to the invitations sent out. One room was set apart for exhibits, which consisted of photographs framed and unframed, and enlargements. A number of stereoscopes, together with slides, were placed upon the tables, and much interest was taken in them. In the large room adjoining, the friends assembled to hear the musical performance. Mr. Beaumont spoke of the rapid advancement in photography, showing how the time had been considerably lessened in the taking of a photograph, remarking that it was within the recollection of many in that room when persons had to sit fifteen minutes; now they could have their portrait taken in thirty seconds, by simply standing before one of "penny-in-the-slot automatic machines." He handed round the room a specimen photograph taken by one of the machines, and it was naturally regarded as a great curiosity, and considered a very fair specimen. A collection of slides by members of the Huddersfield Society were passed through the lantern, eliciting great admiration; also specimens by R. W. Thomas and the Ilford Company. Members from several kindred societies, viz., Batley, Huddersfield, and Spen Valley, were in attendance. The evening's entertainment was a decided success.

HACKNEY PHOT. SOC.:—The *Photography* prize lantern slides were shown on Thursday, the 27th ult., to a very large number of members. Those by Messrs. A. R. Dresser, Wilson, Paul Lange, Edwards, and F. W. Evans calling for special acknowledgment. The Secretary announced a series of papers would be given by Messrs. E. J. Wall, J. Carpenter, A. R. Dresser, etc., and that a *soirée* would be held on the 24th inst., being the close of the first season of the society.

HOLBORN CAMERA CLUB.—On Friday, the 28th ult., about forty members and friends attended to inspect about eighty slides lent by the Britannia Company. At the conclusion of the lantern entertainment, the prizes won in the recent competition were presented by Mrs. Tregaskis, who kindly offered an Optimus lantern for the best set of six slides made this season. The annual general meeting will be held on the 11th inst.

LEITH AM. PHOT. ASSOC.:—The usual monthly meeting of this Association was held in the rooms, Duke Street, on 25th March, Mr. T. W. Dewar, Vice-President, in the chair. After the usual preliminary business, the Chairman delivered his opening address, in which he reviewed the work of the past session, and advocated the still more strenuous pursuit of the higher grades of art, deprecated the following after instantaneous and hand-camera work to the utter disregard of securing carefully-composed pictures, and urged, during the coming season, the desirability of foregoing those "snap shots" which only afforded a transient pleasure, in favour of what was most beautiful and pictorial in nature. Specimens of the new Kallotype printing process and Griffith's detective camera were exhibited. The Secretary thereafter read some notes from the late Cuthbert Bede's book, "Photographic Pleasures," with lantern transparencies of the illustrations, kindly lent for the occasion by Mr. W. Long, jun.,

F.C.S., President of the Glasgow Photographic Society. The membership card for the session, designed by Mr. W. M. Smith, and photographed by Mr. A. D. Guthrie, was then issued to the members.

LIVERPOOL AM: PHOT: ASSOC:—The third ordinary meeting of the twenty-seventh session was held in the Association's club-rooms, 3, Lord Street, on Thursday evening, 27th March. The President, Mr. Paul Lange, occupied the chair, and there was a large attendance. The President announced that the new Boston slides entitled "The White Mountains," and Mr. John Hargreaves' lecture on the completed survey of the "Hundred of Wirral," would take place in the City Hall, Eberle Street, on Monday, 14th April. Mr. Fred Evans was then called upon to explain the arrangements that were being made concerning the Convention of Photographic Societies of Great Britain at Chester in the last week of June, when, amongst other attractions, special facilities not hitherto allowed to amateurs would be granted by the Duke of Westminster for photographing both the exterior and interior of Eaton Hall. The principal business of the evening was the contemplated photographic exhibition of 1891. The President entered very fully into the particulars of the matter: that it should take place in the spring of 1891 for the term of one month, that the offer of the Library and Arts Committee of the Corporation of Liverpool, be accepted for the use of the same splendid apartments in the Walker Art Gallery as used in 1888. The members unanimously decided that such an exhibition should be held. The meeting concluded with an interesting exhibition of photographic novelties (of which there were a large collection).

NEWCASTLE (STAFFS) AND DISTRICT AM: PHOT: SOC:—At a meeting held in the Town-hall on Thursday, March 27th, after a discussion which lasted a considerable time, it was decided not to have an excursion at present. Other little business matters were attended to, followed by Mr. Taylor's demonstration of Eastman's stripping films, which proved very interesting and instructive. A hearty vote of thanks was then accorded to Mr. Taylor for his demonstration.

NORTH MIDDLESEX PHOT: CLUB.—An outing of the above Club has been arranged for Easter Monday, to Welwyn, train leaving Finsbury Park (G.N.R.) at 10.45. Any interested in photography are invited to join. On Monday, the 31st ult., Mr. Thos. F. Smith, F.R.M.S., delivered a lecture on "Micro-Photography," illustrating it by means of lantern slides, and showing the method of making the same. Both botanical and histological slides of great interest were shown, and attested to the care which the lecturer must have given to his subject, some of them being enlarged 2,000 diameters.

PHOT: SOC: OF IRELAND.—At a meeting of this Society, held on the 24th ult., Mr. J. Joly, M.A., gave a lantern exhibition of his photographs of the Swiss Alps. The slides were in every respect excellent, some of the cloud effects being really fine, and the rendering of the detail in pictures of great contrast, such as snow-clad mountains with very dark foregrounds, evidenced careful and judicious development, while the number of plates exposed spoke volumes for the amount of muscular energy expended during the tour. On Thursday, the 27th, the monthly technical meeting was held, Dr. J. A. Scott, M.B., Vice-President, in the chair. After two new members had been ballotted for, the evening was devoted to exhibiting such lantern slides as the members had brought down with them, and some very beautiful pictures were put upon the screen.

SHEFFIELD CAMERA CLUB.—At the ordinary meeting of the above Society, held on the 26th ult., Dr. J. A. Manton read an interesting paper entitled, "The Chemistry of Every-day Photography," profusely illustrated with experiments, diagrams, and blackboard illustrations. The doctor concluded his paper by giving a pedigree of photography, in which each important advance in this wonderful art was discussed and explained.

SOUTHSEA AM: PHOT: SOC: gave a public lantern exhibition on the 26th ult. The entertainment was in every way a pronounced success. A fine collection of pictures, representing Canadian, Scotch, and English scenery, with various genre studies and some very fine views of cathedrals, were thrown on the screen by Lieut. Gladstone, R.N., Lieut. Cobb, R.N., giving a short description of each picture. The slides were entirely the work of members of the society, prominent among whom were Captain Lamb, Lieut. Gladstone, Dr. Wardrop, Messrs. Thornton, Leventhorpe, etc. Incidental music and songs made the pleasant evening pass too rapidly.

WEST SURREY AM: PHOT: SOC:—The second annual exhibition was held on the 26th, 27th, and 28th ult. Some hundreds of photographs, by various processes, were displayed upon screens round the hall; and two shows of lantern slides by the oxy-hydrogen light were given each evening, and there was a large attendance. A large number of the slides were the work of members and friends; the last evening being mostly taken up with those kindly lent by the Editors of the *AMATEUR PHOTOGRAPHER* and *Photography*. The indefatigable Mr. Miall was present each evening, extolling the merits of the Facile camera; and a capital collection of cameras. Haes' Perfection lamp, and several novelties were sent down by Messrs. Marion and Co. In addition to the arctic series of slides sent by Messrs. Fry and Co., for exhibition on the screen, that firm had on the table a pretty display of photographs on celluloid films, which were much admired. Mr. Gale sent six splendid photographs, including his well-known "Sleepy Hollow." Mr. Davison had a fine collection of platinotypes. Miss Winsford had a pretty little collection, principally local views, bits in Battersea Park, etc.; Mr. Winsford, several views, mostly of Scotch scenery; and some fine alpha paper prints were shown by Mr. Faulkner. Enlargements were shown by Messrs. Spencer, Swingle, Smith, Martin, and Borley. Hand-camera work was represented by Mr. Graham, who also had a large number of aristotype prints.

Apparatus.

We have received from the Blackfriars Photographic Company, Surrey Row, Blackfriars, a very excellent shutter, which is called an "Automatic Repeating Shutter." The shutter proper is made of two discs of metal, which open and expose the full aperture of

the lens, and then traverse over each other and repeat the action as many times as the pneumatic ball is squeezed. If the ball is left inflated, and the pin at the top of the shutter drawn out, a time exposure of any duration may be given, lasting until a second pressure of the ball is made, when the shutter at once closes. We have not been favoured with the price of this shutter, but feel certain that if reasonable it must have a very large sale. The milled ring round the opening actuates a strip of metal which forms an adapter with a play of nearly one-eighth of an inch all round—a very great desideratum.

Another useful little apparatus, the invention of M. Decoudun, is also sent us by the same firm, in the form of a pocket compass. The operator has to observe first the direction in which the light falls upon a given object, so that it is fully lighted, and point the handle of the compass to the object, and he will see on the floating disc the hour of the day at which the light will fall directly or obliquely, and all else he has to do is, in the words of Captain Cuttle, "When found to make a note of."

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to **The Editor, "Amateur Photographer,"** 1, Creed Lane, Ludgate Hill, London, E.C.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

361. **Intensifier.**—Wishing to intensify a quarter-plate negative, I took "Radiation's" formula, mentioned in the issue of December 20th, 1889. I accordingly had the solutions made up by a chemist. I put $\frac{1}{2}$ oz. of each solution in a separate measure, and added by degrees No. 2 to No. 1. It turned to a yellow feathery substance, and as it did not dissolve, I added more of No. 2, when a black precipitate formed at the bottom of the glass, which would not dissolve, although I added No. 2 till the measure registered 3 ozs. Would "Radiation" try and explain the cause and oblige?—A BEGINNER.

362. **Death Pot.**—Should be glad to hear the best method of destroying life of insects, etc., for microscopical purposes?—PHOTO-MICROGRAPHER.

363. **Swinden and Earp's Camera.**—Will any kind reader give their opinion of Swinden and Earp's detective; do the plates get fogged in any way when changing to chamber, or by time exposures, because I notice the rays from lens pass over the exposed plates, and sometimes I notice the plates do not always fall into chamber with the paper backing side up; and is the lens a good one?—DETECTIVE.

364. **Quick Printing Paper.**—Would some amateur kindly relate briefly his opinion and experience of Marion's quick printing paper as a developing paper? Are the prints equal in brilliance and colour to silver prints?—ELECTRA.

365. **Willesden Paper.**—Would be glad to know where Willesden paper can be obtained, and if sold in small quantities?—H. D.

366. **Loan of Negatives.**—Will any amateur kindly lend me a few quarter-plate negatives to make lantern slides from? I will take great care of them, and pay all expenses.—W. J. HINCKLEY (Address with Editor).

367. **Hydroquinone.**—Ilford. Will anyone kindly tell me the proper way to mix the above? I made it up as follows:—

Johnson's hydroquinone ... 160 grs.
Sulphate of soda ... 2 ozs. avoird.
Bromide of potassium ... 30 grs.

putting the lot into a bottle, and making up to 20 ozs. with hot (not boiling) tap water. This solution has since turned brown; and shall be obliged if any amateur will give me the reasons why, and how to avoid this in future, as I am anxious to use this developer in place of pyro.—NANKI-POO.

368. **Perspective.**—Am using Ross' R.R. lens, and Wratten's instantaneous plates. Get good sharp definition on screen of hills nine or ten miles distant. Expose in fair light 3-4 seconds, working at $f/22$. On developing (rather under-exposed) detail on negative only includes half distance. What is aerial perspective of this lens, or why do I fail to get on negative detail shown on focussing screen?—FLANGE.

369. **Choice of Shutter.**—Will someone kindly advise me as to purchase of shutter for all-round work? Is the Norden flap shutter a good one? Also please give opinion of Gem pneumatic shutter and Lylar's window shutter?—ARGENT NITRAS.

370. **Finder.**—I wish to make a detective camera by placing my quarter-plate Instantograph in a box, and using my half-plate rectilinear lens. Can anyone inform me how to make a cheap finder, to show identical view, and to be unobtrusive? The lens is $\frac{1}{8}$ in. focus.—MERC.

371. **Exposure for Bromide Paper.**—I saw 8 seconds suggested as the approximate exposure in enlarging from quarter-plate to 10 by 8 by artificial light. I enlarge by daylight, and have to give 7 or 8 minutes for the same sizes, using rapid paper. How is this?—J. W. D.

372. **Toning Trouble.**—About ten days ago I mixed a combined toning and fixing bath, and used it for one batch of prints. It seems now to have lost its toning properties, and there is a darkish sediment. Is this the gold? and if so, how shall I collect it for re-use?—J. W. D.

373. **Hand-Camera.**—Have made a hand-camera, and the lens works at $f/3$ (a fixed s.o.p.), and I find considerable diffusion of focus at edges. If I insert a stop, say $f/10$, this would doubtless sharpen the focus at edges; but would $f/10$ be a big enough stop for very quick exposures, such as a hand-camera demands? Please name best developer for rapid work.—J. W. D.

374. **Reflex Camera.**—Can anyone kindly inform me on the Lumann's Reflex camera? Is it a practical one? Does it give good results?—GIULIO.

375. **Plate-Washer.**—I have got a plate-washer running at the rate of 1 gallon per minute. Will some reader tell me how long it will take to remove every trace of hypos from the plates?—T. LAKER.

376. **Argentine Paper.**—Will some reader of the AMATEUR PHOTOGRAPHER kindly tell me how I can obtain brown tones on Fry's argentine paper?—T. LAKER.

377. **Multum-in-Parvo.**—Can anyone advise me as regards good work being done with the above (Lancaster's), by flash-light also?—ORGANIST.

378. **Hockin's Lens.**—Would someone oblige by saying if they are good, and found them so whilst working with them, especially the R.R. and W.A., also single W.A.? What aperture does the R.R. work at, and is it as good as Optimus R.R.?—ORGANIST.

QUERIES UNANSWERED.

Feb. 21st.—Nos. 3471, 3476, 3478, 4391, 3493, 3404.
28th.—No. 3517.

Mar. 7th.—Nos. 3528, 3530, 3531, 3542, 3551, 3554, 3556.

14th.—Nos. 3561, 3566.

21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3601, 3610, 3612, 3613, 3614.

28th.—Nos. 3619, 3620, 3628, 3629, 3630, 3633, 3634, 3636, 3637, 3638, 3640, 3641, 3643, 3650, 3652, 3653, 3655.

ANSWERS.

3559. **France and Italy.**—After many years' residences in Italy, allow me to inform A. B. Price and A. J. Cross that in the two provinces of Naples and Rome (presumably, therefore, throughout the kingdom) a photographing order, to be obtained through the British Consul, is absolutely necessary for work in any of the ruins or monuments which are under Government supervision, i.e., Pompeii, Herculaneum, Palace of the Cæsars, Colosseum. Being an amateur worker, I speak from personal experience, and have one of the orders in question for the province of Rome. Since writing the above, I find, at page 608 of the "British Journal Photographic Almanac" for 1889, that Messrs. Robinson and Thompson remark: "For photographing ruins of Rome they will have to show passport, and get permission at 'office for preservation of ancient monuments,' situate near the Forum, but interiors of churches at various places. For Pompeii, permission at Naples Museum, also for Praetium. No difficulty about exteriors of buildings at Rome, Venice, etc., if not ruins."—ALPHA-BETA.

3579. **Removing Stains from Steel Engravings.**—A very weak solution of chloride of lime, in which engravings are soaked, will usually remove all stains, and whiten the paper. Try with as much of the chloride as will rest on a sixpence in a quart of water.—ALPHA.

3592. **St. Heliers, Jersey.**—There are many photographers in Jersey; Norman, of Belmont Road, among others, is always ready to oblige tourists.—ALPHA.

3600. **Lantern Slides.**—I prefer Thomas' plates for lantern slides, and the developer indicated in the instructions, but this may be a matter of taste; many like the Ilford. I clean all my covering-glasses with soap water, and finish with methylated.—ALPHA.

3605. **Light Camera.**—Get one of Underwood's half-plate Instantos, or, better still, their President, and it will answer your purpose well. I can recommend the latter, as I have one.—PHONO.

3608. **Perfection Lamp.**—I never use any other, and, with the usual precaution of not allowing the direct light to fall on the plate until the image is fairly well out, never have a trace of fog when using either drop shutter or isochromatic plates.—THE INVENTOR.

3621. **Lens.**—A quarter-plate $4\frac{1}{2}$ focus lens will take half-plate pictures, if well stopped down. Of course the results, especially towards the margins, will not equal a half-plate lens.—HUCK FINN.

3621. **Lens.**—If a doublet lens, screw off one combination, and you will have a good half-plate single landscape lens of 9 in. focus.—J. A. SINCLAIR.

3621. **Lens.**—It all depends on the quality of the lens. You cannot tell without trying, but the chances are you will not be able to use a quarter-plate lens with a half-plate camera. You can never do so with a cheap lens, but you possibly may be able to do so with a Ross or any lens of that standard.—W. A. J. CROKE.

3621. **Lens.**—A quarter-plate R.R. lens by a good maker, such as Wray, will cover a half-plate with a moderate size stop, say $f/16$, but then the querist must remember that in this case the lens will act as a wide-angle one.—P. K.

3622. **R.R. Lens.**—Hockin and Co. supply a quarter-plate R.R. lens at a moderate price, which I think would suit you. Remove the flange belonging to the Merveilleux lens, and fix the flange which is supplied with the above-mentioned lens, in its place.—P. K.

3622. **R.R. Lens.**—Of course, any lens will fit your camera. You may possibly have to get a new front made, but that is not an expensive business.—W. A. J. CROKE.

3622. **R.R. Lens.**—I don't know whether you can buy an R.R. lens to fit your Merveilleux lens flange or not; if you cannot buy a new R.R. lens to fit, fit the new flange on to the front of the camera, having previously taken out the flange of your old lens; if the new flange is too small for the hole left by the flange of the old lens, get a carpenter to insert a piece of wood in the hole, and fasten your new lens on to it.—HUCK FINN.

3623. **Enlarging Lantern.**—Size of good enlargement depends on detail in your negative. In any case substitute your camera lens for the lantern lens, and stop down for even sharpness.—J. A. SINCLAIR.

3624. **Yellow Stain with Hydroquinone.**—To prevent this, give longer exposure. It is produced by prolonged development in a strong solution.—J. A. SINCLAIR.

3624. **Yellow Stain with Hydroquinone.**—This yellow stain nearly always occurs with the hydroquinone developer when used to develop bromides. But I always clear the print in a solution of citric acid and alum, both before and after fixing. For a simple formula see "Fallowfield's Annual." This entirely removes any deposit or stains.—W. A. J. CROKE.

3624. **Yellow Stain with Hydroquinone.**—See letter to the Editor on this subject, in this week's number.—W. E. REYNOLDS.

3625. **Printing for Amateurs.**—The Editor of this paper some time ago applied for apparatus for some homes where the work you require is most satisfactorily performed at a very modest figure; the homes were, I believe, at Earningham. I should advise your writing to him direct, as he will doubtless be glad to give you full particulars.—W. A. J. CROKE.

3625. **Printing for Amateurs.**—I find Elderfield, photographer, South Street, Farnham, tones and fixes my half-plate prints very well, at about 1s. 3d. a dozen; he would, doubtless, print also from amateur negatives.—L. R.

3625. **Printing for Amateurs.**—If "Poor Chinese" writes me, I will send him address of a trustworthy firm and cheap.—ALPERUM (address with Editor).

3625. **Printing for Amateurs.**—Hinton and Co., 35, Bedford Street, W.C., I think would suit you. They charge 2s. 6d. per dozen for ordinary silver printing, quarter-plate size. What I have seen of the work has been very good.—EDYLLION.

3626. **Quick Printing.**—The Platinotype process will be the very thing for you; address, 29, Southampton Row, W.C.—P. K.

3626. **Quick Printing.**—"Poor Chinese" should try the ferro-cyanide paper to be obtained from Mr. J. R. Gotz, 19, Buckingham Street, Strand, London, W., at 17s. per twenty yards roll, 2 $\frac{1}{2}$ inches wide (No. 15). This will give him a good proof from a negative in bright sunshine in from one to two minutes' exposure, and only requires to be put in an ordinary bath of hyposulphite of soda for a few minutes, when he will have a good sepia print on a duck-egg-green ground. Printing in shade from five to ten minutes. I enclose specimen. They are permanent as far as I have tried them. The paper keeps well.—A. P. G. D.

3626. **Quick Printing.**—This "Heathen Chinese" evidently sighs for impossibilities. Cannot recommend him anything quicker than bromide paper, developed with hydroquinone.—J. A. SINCLAIR.

3626. **Quick Printing.**—Try the Pizighel platina printing process; some obtain very good results with it; you might also try the sepia printing process; sepia paper can be bought at Sharp and Hitchmough's, 101, Dale Street, Liverpool, price 7d., 9d., 1s. 3d., and 2s. 6d. per dozen.—HUCK FINN.

3626. **Quick Printing.**—I think Pizighel's platinum paper is the one that comes nearest to what you want. I should think, of nearly all dealers.—EDYLLION.

3627. **Collodio-Bromide.**—The only absolutely certain way is to previously coat the plate with a two grain solution of gelatine as a substratum.—EDYLLION.

3627. **Collodio-Bromide.**—I shall be pleased to help "R. B." if he will write to me.—MEDICUS (address with Editor).

3631. **Aperture of Lens.**—Using a half-plate lens on a quarter-plate would not alter the working aper

ture of the lens. You will require a long-extension bellows, and will have to go further back from objects than you would if you were using the lens for a half-plate camera.—P. K.

3632. Sunk Mounts for Enlargements.—You can buy the mounts you require at J. Fallowfield's, 35 and 36, Lower Marsh, Lambeth, S.E. Size of board, 15 by 12; size of tint, 8½ by 16½; price, 19s. per hundred. Size of board, 21½ by 17½; size of tint, 15 by 12; price 48s. per hundred; or size of board, 25 by 19; size of tint, 18 by 14; 56s. per hundred. I suppose you mean that your enlargement, without cutting down at all, is 15 by 12. If so, mount them on the 18 by 14 tint. I do not know whether you can buy the mounts in smaller quantity or not.—HUCK FINN.

3632. Sunk Mounts for Enlargements.—Write to Fox and Co., Little Britain, Aldersgate Street, London, for list. They are expensive, but very good for high-class work.—J. A. SINCLAIR.

3632. Sunk Mounts for Enlargements.—Messrs. Fallowfield, of Lower Marsh, Lambeth, make a speciality of the above. They will give you full particulars and prices.—W. A. J. CROKE.

3635. Toning.—I tone my prints according to Dr. Kibbler's process, first with gold and then with hypo and acetate lead; and I find best results are obtained with fresh hypo.—P. K.

3635. Toning.—The hypo may be kept in solution, but the acetate of lead must be added to fixing bath immediately before using.—W. A. K.

3639. Focusing.—I would suggest an adapter with coarse external screw in a large flange, and internal screw to take lens. A hand or lever attached to this would read against a brass graduated strip or dial. This is an arrangement I have in view for a projected hand-camera.—R. W. B.

3642. Paper Negatives.—I have used Morgan and Kidd's ordinary smooth enlarging paper with thorough success. With f/24 on a well lit and fairly open view 15 to 20 I found about the right exposure. Developer: Pyro and sulphate of soda, with ammonia and bromide ammonium. No clearing bath is necessary, but a squeegee is a great help in washing. The best results are obtained by drying on a sheet of glass previously coated with plain collodion, and then oiling the back with vaseline. This last is not necessary, but it produces decidedly the best results.—EDYLLION.

3644. Torquay.—B. B. will find every requisite at Torquay in the way of photography. Cox and Durant, of the Victoria Parade, have a dark-room for amateurs, at a nominal charge of 6d., and Mr. Bathe, chemist, has also one, I believe. The latter keeps everything in the way of chemicals and plates, and is most obliging. Mr. Torzer, of Fleet Street, and Horton and Co., of Sozwood Road, also deal in photographic goods, so "B. B." need not be in want of anything.—N. M. H.

3644. Torquay.—All photographic requisites can be obtained of W. Bathe, 10, Abbey Road; he would doubtless lend you his dark-room, or would tell you of one in the neighbourhood.—W. A. J. CROKE.

3645. Spring Carrier.—I know of no cheap spring carrier for a Safety. I always carry my quarter-plate camera slung on straps between the handle bar and the seat; it swings easily, and does not seem to damage the plates or slides.—HUCK FINN.

3646. Lens.—If you have Shew's hand-camera I should certainly advise you to get Shew's lens; it is a splendid instrument, and has a shutter working between the combinations. Taylor makes some splendid hand-camera lenses, also with shutters attached.—HUCK FINN.

3646. Lens.—I can strongly recommend Wray's quarter-plate R.R., which works at full aperture, viz., f/5.65.—P. K.

3647. Toning.—The following bath I think will suit you: Acetate of soda, 20 grs.; chloride of gold, 1 gr.; water, 8 ozs.—P. K.

3648. Oil Paintings.—Edwards' Isochromatic plates are splendid for this purpose. If contrasts of yellow and blue in painting, use yellow screen in front of lens to obtain correct tone.—J. A. SINCLAIR.

3651. Eikonogen.—I have found no difficulty in this, except with Ilford plates. I cannot account for this.—R. W. B.

3654. Lens.—W. Pollock evidently wants to know how to find focal length of his lens, and value of the stops. Sufficiently accurate for all practical purposes is the following simple method:—Focus on ground-glass some object over 30 ft. from camera, and measure distance between ground-glass and diaphragm slot (or if single lens to the lens itself). This is roughly the equivalent focus, which, for example, we presume is 8 ins. The diameter of stop divided into the focal length gives value of the stop. Thus, supposing the stop is 1 in. in diameter, its value would be f/8; if ½ in. in diameter f/16, and so on.—J. A. SINCLAIR.

3657. Oil Light for Lantern.—Carefully trim the lamp; use the best oil, and for each pint add two of Naylor's paraffin carbons. These render the light much whiter, and help to prevent smoke. It is also claimed that they reduce danger of explosion. They can be obtained of T. Naylor, 15, Denmark Place, Charing Cross Road.—EDYLLION.

3658. Magnesium Light.—Your query is answered in Mr. Hepworth's articles on above subject in last number.—P. K.

3659. Detective Cameras.—If "Onyx" will com-

municate with R. W. B. (address with Editor), he will be willing, if possible, to assist him.—R. W. B.

3660. Hand-Camera, Lens, and Tripod.—I should certainly advise you to get Shew's Eclipse hand-camera. I believe the firm are making a roller-slide for their camera, but if it is not yet out you can have any of the roller-slides adapted. The lens supplied with their quarter-plate camera is, I believe, of 4½ ins. focus, and is a capital little article. Get one of the four-fold camera stands, Watson's or any other good makers; if you want a very light and unobtrusive stand, get the walking-stick stand: I cannot say whether it is of much good or not, as I have not tried it.—HUCK FINN.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED:AM:PHOT:

A. W. GOTTLEB.—Many thanks for the opportunity of perusing Mr. Edwards' letter.

REV. W. BENNETT.—Our publishers have submitted your letter. You are, of course, a free agent, although we much regret that you should have used expressions towards us that are not in keeping with that charity which "suffereth long and is kind."

A. B. READER.—Omitted by an oversight. Our "District Editor," Mr. J. D. Eastham, will in future attend your meetings, and we shall hope to be able to give yours and other societies in the district more attention.

W. A. SOUTHWELL.—We are much obliged, and will register your "Dark-Room."

GEO. KEMP.—We have your card re "Dark-Room," for which many thanks. The particulars shall be noted.

H. ARMISTEAD.—Your room will be included in our list, also the other particulars.

F. W. LEVETT.—Matter came too late for the 31st of March REPORTER.

WALTER J. DAVIES.—You will note that we refer to your album in another column. You must give a little more study to the technique before your photographs are up to even "Monthly Competition" form. When next in town, call upon us.

S. C. HOVENDE.—The paper is most likely stale and damp. Get some fresh paper, and let us know the result. See also that your toning bath is carefully made up in accordance with a good formula. Be sure you thoroughly wash your prints before placing in the toning bath. We shall be glad to hear that you have overcome your difficulties.

B. FURNEAUX.—Lens, shutter, and camera case received.

A. CROCKFORD.—We cannot trace the "Watch Camera" your letter has reference to.

MRS. CULVERHOUSE.—A very interesting summary of the paper is given in the PHOTOGRAPHIC SOCIETIES' REPORTER for March 31st. We thank you for kindly calling attention to the subject.

G. FAIDO (Venezia).—Your query is inserted, and we have written you a few lines.

CAPTAIN.—The first is an excellent hand-camera, and will, we think, answer your purpose with R.R. lens. The second is perhaps better finished, and has some advantages; but work done with either should be equally good. We do not consider the camera named in postscript is equal to either of the others. The shutter mentioned is so far free from vibration that what little does take place is after exposure.

E. B. GREENWAY.—We know the real maker's camera, and unhesitatingly say it is one of the best in the market. We have never seen a camera made by the "imitating firm," and cannot, therefore, advise you as to the work of the "exact copy." We do not particularly care for the plates, although some workers speak very highly of them. Many thanks for your complimentary opinion of our efforts.

G. L. W.—We place them in the following order: 4, 2, and 3.

NOVICE.—Our advice would be that you buy either E or A; the latter is very compact, but you must either use a roller-slide, changing-box, or double backs. We, therefore, should advise E.

FRANCAIS.—We will look up a dark-room. (2) You only name one, which we cannot recommend. (3) You would find a changing-bag of service, and would then be independent of "dark-rooms." Very pleased to see you and your prints. After next week our "At Home" days will be Mondays from 2 to 5 p.m. and Thursdays from 11 a.m. to 1 p.m.

PICKWICK.—Your print, No. 1, is a very poorly composed picture, and is quite devoid of interest. No. 2, a good photograph technically, but the cutting off of the trees takes away from the beauty of the landscape; you might have reduced your foreground, and so have secured the glen with the

trees, assisting to make up a picture. No. 3 is better, and makes a very fair picture of subjects really possessing but little picturesqueness in themselves. It is certainly your best, and a series of, say, 4, taken along the stream, if up to the same quality, might be worth entering at one of the exhibitions, but they are not prize pictures by a long way. Due notice will be given, some weeks yet. A and C are both good shutters; in fact, all you mention have good points, and you will be safe in buying any one of them.

MALICE (Nice).—The entry forms are sent on to you; you could send the photograph to the next competition, "Genre, or Figure Study." If you will send us some prints we will gladly criticise them.

TREBLE X.—You had better write to the editor; in our copy the figures are quite unintelligible. It would be rather "bad form" to publish your letter, as it reflects upon the manner in which contemporary literature is turned out. If you are coming to town, shall be glad to see you.

W. E. DOBSON.—The No. 2 lens would best suit your purpose; very excellent cheap lenses are sent out by the firm.

F. M.—If you had bought the PHOTOGRAPHIC SOCIETIES' REPORTER, and referred to the "Official Announcement" column, you would have found the address of the Hon. Sec. of the West London Photographic Society—Mr. John A. Hodges, 87, Chancery Lane, E.C. Write to him, and he will give you all particulars.

E. G. RICHARDSON.—In order to prevent the black deposit or precipitate, keep the toning bath from the light. If the precipitation has occurred, the bath is practically useless. To renovate the old baths, see Wall's "Dictionary," page 200.

JOHN CAMPBELL.—Your photographs are charming. In the moonlight effects the moon is rather too "pronounced," and the reflection is rather unreal. The clouds are really perfect. We shall hope to see your work in our competition. The harbour scene and two landscapes are really very fine, and quite up to exhibition standard.

LEONARD BROWN.—Point your lens full at the sun. There are some printing-out papers sold which give the effect. We should not advise your using the dye, but you might experiment, and let us see the result.

A. CORNISH (Quimper).—We have inserted sufficient of your letter to secure an answer from the patentee or someone qualified to answer.

E. LLOYD EDWARDS.—You have received our advice as to hand-cameras. Your friend, Mr. J. O. Bury, is more than satisfied with the instrument we recommended you, and the results he has sent us are admirable. We have nothing to say in favour of those named. A is complicated and, certainly in our opinion not as serviceable as the one already mentioned. B, unless much improved, is roughly made. C we have not tried. The films you name are very frequently spotty and unreliable, and are certainly not "worth taking up instead of glass." The lenses you mention are very good, and will give you excellent results.

OLAUDIUS.—Yes, but it will be some weeks hence. They are at your service. A is a capital shutter, and so is C. The R.R. lens is a good one, and should give you a good instantaneous picture working at f/8.

CHAS. J. WILKIE.—Very many thanks for the capital batch of prints for our "Hospital Albums."

GEO. H. MANT.—Of the two we should advise No. 1, with the lens named. No. 2 is complicated.

OSCELE H. PALMER.—No lantern-slides will be returned until after the Easter holidays. We see callers only on certain days, or by appointment. The slides were at the Palace.

MUWA.—If a hand-camera, e; if a detective camera, b; if with roller-slide, or if to carry in the pocket, a; if to use with double backs, d. All these are very first-class instruments. Could you not support the movement on foot to form an amateur photographic society in Edinburgh?

E. C. L.—No. 2 "AMATEUR PHOTOGRAPHER'S Library" is now ready, and on sale at all photographic dealers, and should be on sale at the Army and Navy Stores.

W. B. FARNHAM.—We cannot undertake to report upon bicycles or any other goods unless they are sent to us by the seller.

E. G.—Unhesitatingly we advise No. 1, one of the best cameras made. A, a most admirable apparatus. We should advise R.R. lens. F: the lens you name is one of the best detectives in the market. The R.S. that you have should answer your purpose. If you like to have any of the goods you select sent to us, we will examine them and report to you.

T. R. HUBBACK.—The work will be commenced after Easter, but it will be some weeks before the number is issued. Entry forms are at your service or any of your friends, and we shall be pleased to send them.

P. J. F.—We have never worked with the camera you name; if you like the maker to send it to us for inspection, we will report upon it on our usual terms. We strongly advise the taking up of small work, and are always ready to encourage lantern-slide making.

W. J. D. WALKER.—We have complied with your request.

DUNOLIN.—A: Although advertised somewhat persistently, we believe it is a fact that this camera has never been on sale; we know nothing of it, except from the advertised description, therefore cannot advise you to purchase. Even supposing you could procure the apparatus, we have no knowledge of any firm in England having them on sale. B: Another camera which may be known in France, but is quite unknown in England. (2) We should not advise you to use them for hand-camera work. (3) It is unfortunate, but really we can give you no information about the enlarging apparatus. Why not write to the maker?

GROVE.—The cameras A or B are very good for the money. We should advise lens D. You can quite rely upon goods bought through our Sale and Exchange columns if sent to us and purchased subject to our report. Certainly try an R.R. lens; write to makers for prices. Very few makers' lenses follow as far as fittings, but can be used in any camera with an adapter, or a new front can be made. The E lens does good work, but is not so good as D.

A. E. LAKE.—For all-round work, No. 1, a most excellent lens.

CHARBONIER.—No. 2. A: The R.R. lens will give you excellent definition. B: Very effective shutter. C: Plates are in perfect register. D: No chance of scratching plates. E: Quite easy and reliable. F: A most useful apparatus.

A. F. M. POWELL.—Your suggestions have not lain dormant. See "Our Views" this week. We could not give up the space in this paper to publish the names, addresses, etc., of photographic societies, but they are fully set out, and the arrangements for their meetings, in the PHOTOGRAPHIC SOCIETIES' REPORTER. We will write you shortly. Could you not help in the formation of an amateur photographic society for Edinburgh?

MELLING.—We saw No. 1 last year, but have had no opportunity of working with it. We have asked the maker to send us one for inspection. The lens is probably a French one. No. 2: We have had no opportunity of testing the lens, or using the camera. No. 3: We never name apparatus in this column.

MOUNTANT.—We will work out the idea.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamp preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

Cameras, etc.—Whole-plate camera, 3 backs, best quality; £6 10s.—Pellatt, 81, Bishopsgate Street, E.C.

Half-plate Instanto camera, two double slides, three-fold tripod, Universal head, 50s.; quarter Instantograph camera, part exchange. — 2, Gordon Road, Hastings.

Kodak, No. 1, new last December, latest improvements, self-capping shutter and transparent (non-stripping) film for 100 exposures, carrying case, manual, etc., complete and perfect as when new; will deposit with Editor if desired; price £4. — J. Morson, North Road, Durham.

Camera Case.—Camera case, Lancaster's waterproof, stiff leather bound, new, 11 by 6 by 11; 8s. 6d.; approval 6 stamps. — 6, Albion Cottages, Avenue Road, Stamford Hill, N.

Cameras, Lenses, etc. — Rouch's whole-plate patent tourist camera, swing and reversing back, three double slides, leather case, 9 by 7 Ross' R.S.

lens, little used; £11 lowest.—Stanford, 44, Borro-dale Road, Wandsworth, London, S.W.

Rayment's patent half-plate camera and one dark-slide, cost 115s.; also Optimus portable symmetrical half-plate lens, cost 52s. 6d.; will be sold cheap; offers solicited.—Pattison, 6, Burt Terrace, Gateshead.

Good mahogany studio camera and lens, takes pictures 10 by 8; £5; or what offers? — Edward Wood, 215, Abbey Hey Lane, Gorton, Manchester.

Changing Box.—Lancaster's Instantograph changing box (half), almost new, cost 31s., holds dozen plates, great advantages over slides; what offers? Write for information. — Bigland, Clarence Crescent, Newcastle-on-Tyne.

Lenses. — Half-plate rapid rectilinear lens; 30s.; good bargain.—T. Taylor, Tannery, Marple.

For sale, Lancaster's half-plate W.A. Rectigraph, with adapter to fit R.R. mount; lowest price 28s. Also 5 by 4 Optimus W.A. Euryscope, new; price 53s.; covers half-plate.—Address, A. P., care of M. Stalton, Guildhall Street, Lincoln.

Ross' portable symmetrical, No. 3, 5 in. focus; 45s.; cost 63s.—Sydney Stockwell, Morley, Leeds.

Optimus rapid rectilinear 12 by 10 lens, cost £7, nearly new; will take 50s. — Address, Piggins, 96, Old Kent Road.

Lenses, etc.—5 by 4 portrait lens, half-plate rapid rectilinear, large 5-cell battery, lamps, and bells; exchange for thoroughly good whole-plate camera, or sell separate.—Rector, Trusthorpe, Alford, Lincs.

Lancaster's quarter Instantograph lens, with shutter, 15s.; half-plate wide-angle Rectigraph, 25s.; three mahogany slides, quarter Instantograph, 11s. 6d.; all above quite new. Abraham's quarter detective, carries 12 plates changed from outside, £4 10s.—Medicus, 10, Warrender Park Terrace, Edinburgh.

Lenses, Plates, etc.—Ross' portable symmetrical, 4 in., 45s.; and 5 in., 50s.; Laverne rapid rectilinear, Iris diaphragm, whole-plate, cost 108s., price 55s.; Laverne half-plate rapid rectilinear, cost 50s., price 22s. 6d.; three dozen rapid Ilford plates, 7s.; three spools half-plate stripping films, cost 19s. 6d., price 15s.; approval.—Box 23, Southampton.

Roll-Holder.—Morgan and Kidd's roll-holder, perfect condition.—Hawksley, 76, Roe Lane, Southampton.

Sets.—Whole-plate outfit, Middlemiss camera, Dallmeyer lens, three double backs, shutter, tripod, bag, complete, perfect condition; £12.—G. G. Beaumont, Woodleigh, Dewsbury.

Watson's half-plate camera R.R. lens, tripod, three dark-slides, instantaneous shutter, view-finder, cost £10 6s., sell £3, splendid condition; also best leather camera case, velvet lined, cost 25s., sell 17s.; approval.—Perry, Holmdale, St. Jude's Road, Wolverhampton.

Shew's box hand-camera, with Eclipse lens, finder, changing back for 12 quarter-plates, finder, and Watson's cyclist's tripod, only used once; cost £7 10s.; price £5 10s.—Camera, 31, Glenam Road, N.E.

Lancaster's quarter-plate Instantograph 1888 for sale, three double backs, and tripod stand, lens, shutter; what offers?—Corrie, Acryse Place, Folkestone.

5 by 4 leather bellows camera, reversing back, double swing, rising and falling fronts, two best double slides, rapid rectilinear lens, wide-angle Optimus finder, tripod, canvas case; price 105s. — 273, Walworth Road, London.

Lancaster's half-plate Special camera, four double backs, three Tylar's, and adapter, in canvas bag, sliding leg tripod, all in good condition; price £5.—S. Sidebotham, 7, Leonard Street, Lower Openshaw, Manchester.

Half-plate leather bellows camera, reversible swing-back, lens, double slide, tripod; 45s.—Owen, Kimbolton Court, Leominster.

Half folding camera, reversing back, three double slides, lens, 35s., worth 60s.; Optimus tripod 10s. 6d.;

burnisher, 4s. 6d.; photograph, stamps. — 108, Leonardgate, Lancaster.

Good Mervelleux quarter-plate camera, dark-slide, lens, focussing cloth and stand, genuine bargain, only 13s. 6d.; also half-plate rapid (f/8) landscape lens, with stops, splendid definition, almost new, 15s. 6d.—S. Jackson, 12, Oldham Road, Fails-worth.

Quarter Tourgraph set, new, 21s., bargain; Optimus 5 by 4 R.R., new, 23s.; splendid half-plate lens, revolving stops, 15s.; exterior background, 10s.—Tooth, Caldecott Street, Rugby.

Whole-plate Meagher's camera, parallel bellows, one single and three double slides, two leather cases, Ross' rapid rectilinear lens, sliding-leg tripod, all in good condition; price £12 12s. — W. Simpson, 4, Blenheim Terrace, Leeds.

Shutters. — Half-plate Phoenix shutter, perfect condition; 10s.—Major Ashley, Fermanoy.

For sale, half-plate Phantom pneumatic shutter, good condition; 15s. — Hughes, West Ham Union, Leytonstone.

Studio. — Good portable studio, bargain; or exchange good Safety bicycle; photograph 2 stamps. — Mason, 5, Pleasant Row, Radford Road, Nottingham.

Sundries.—For sale, a 12 by 10 double dark-slide (book form, good as new), 5 by 4 wooden-body camera, slide, and portrait lens, Vever's 7s. 6d. burnisher, used twice, wall and pillar, and balcony and pedestal (both imitation stone, photograph 2 stamps); what offers? — Wm. C. B., 48, Lincoe Street, Gloucester.

WANTED.

Cameras. — Half-plate Instantograph camera, without lens or stand. — Photographer, Catherine Street, Devonport.

Half-plate square bellows camera, double slides, or whole-plate, cheap.—Day, 35, Berger Road, Homerton.

Camera Case.—Half-plate camera case, leather; reply.—Ford, 22, George Street, Richmond, Surrey.

Daguerrotype.—Copy wanted in silver or platinotype, coloured best work only.—H. W. Hartley Barron, Sheffield.

Lanterns.—Lantern, complete, and good half-plate lens. Will give Hillman's tricycle, worth £3.—Kennett, Sandgate, Kent.

Biunial lantern, in exchange for Dulciana pipes and other materials for small organ.—C., 8, Victoria Street, Brighton.

Lenses.—Half-plate rapid rectilinear lens, by first-class maker; state fullest particulars.—Alfred Hendrie, Thornwood, Uddington, N.B.

Quarter rectilinear lens for detective, cheap.—84, Albert Road, Croydon.

Dallmeyer's quarter rapid rectilinear, must be perfect condition.—Western, Ravensbourne, Shortlands.

7 by 5 Optimus rapid Euryscope or rapid rectilinear, must be cheap. — Parkes, Wilfrid Terrace, Jocks Lodge, Edinburgh.

Roll-Holders. — Eastman's improved half and quarter sizes.—H. W. Hartley Barron, Advertising Agents, Sheffield.

Roll-Holder and Lens.—Eastman roll-holder, 6½ by 4½, or 7½ by 5, old or new pattern, Wray's narrow-angle landscape lens, 5 by 4, must be cheap. — S., East Shelford Rectory, Lambourn, R.S.O., Berks.

Sets.—Whole-plate Instantograph, Lancaster's, complete. — State particulars and price to H. J. Adams, St. John's, Cedars Road, Beckenham.

Quarter Instantograph, recent pattern, including camera, three double slides, tripod, also extras, if possible without lens; approval.—Western, Ravensbourne, Shortlands.

Large lens or set, and quarter portrait wet-plate set; exchange oil landscapes by 30 years' exhibitor, Lodd Bridge, 28 by 36, soiled frame, £12, and others on view or reference. — H. Gummery, Henwick, Worcester.

Now Ready, Price 6d.

NOTICES AS TO ADDRESS.

PUBLISHING DEPARTMENT.—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the *Amateur Photographer* are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—SALE AND EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

ADVERTISEMENT DEPARTMENT.—All communications respecting TRADE Advertisements in the *Amateur Photographer* are to be addressed to PARRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—Trade Advertisements are received up to Tuesday morning.

EDITORIAL DEPARTMENT.—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or Apparatus for Notice or Review are to be addressed to the Editor, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

NOTE.—To ensure insertion all Communications should reach the Editor on Tuesday.

CORRESPONDENCE SECTION.—Anyone wishing to communicate with Contributors can do so by forwarding such Communication in stamped envelope under cover to the Editor, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

THE "AMATEUR PHOTOGRAPHER" FIRST LADIES' PHOTOGRAPHIC COMPETITION.

PRIZES.

First Prize	Gold Medal.
Second "	Silver Medal.
Third "	Bronze Medal.

(These Medals, of the smaller series, will be appropriately mounted as Brooches).

SUBJECTS.

Landscape or Seascape—Landscape with Figure—Genre or Figure Study.

NOTE.—The adjudication will be made by lady artists and lady photographers. It is hoped that it will be possible to make arrangements to exhibit the photographs at a *Conversazione* to be held in the offices, 1, Creed Lane, E.C., during the month of June.

Further particulars on application to the Editor, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

"In Daylight, Gaslight, Sunshine, Rain,
Each faithful 'Demon' works the same,

THE "DEMON" CAMERA

Defies Detection, and can be secreted under the vest, in the watch pocket, or concealed in the glove. It is made entirely of metal, beautifully plated, and weighs under 3 ozs. No movement is too rapid for it—the racehorse at greatest speed, the flight of birds, even the lightning flash itself. By merely pressing the trigger the Photograph is taken, therefore any person can use it, no knowledge of photography being necessary, for, unlike other cameras, it requires no focusing, no stand, no adjustment, no dark slides; yet hundreds of plates can be carried and exposed in rapid succession.

Read the following—

91, Newsham Drive, Liverpool.
Dear Sir.—Your "Demon" Detective Camera is the most wonderful and ingenious camera ever manufactured, and I cannot understand how it can be made for this money. I am a member of both the Liverpool and Birkenhead Photographic Societies, and will gladly distribute circulars respecting it among the members.

Your truly, G. M. NOOKES.

NOTE.—Apparatus, including Plates, Chemicals, and Instructions, post free, 5/6; extra dry plates, 9d. per doz. (6 doz. 4/).

Remember! We are the Cheapest Camera Makers in the World, the Cheapest for Dry Plates and all Sundries.

Illustrated Photographic Catalogue, post free, One Stamp.

AMERICAN CAMERA COMPANY

{ 93, OXFORD STREET, LONDON, W.
Also 397 & 399, EDGWARE ROAD, W.

NOTE ADDRESS—All Orders to Manager, P.P. Department, at latter Address.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

The following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his *personal experiences*. It is intended that each subject shall be written up by a specialist for the *ANNUAL*, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

Subjects.

28th April	Action of Light.
28th May	Exposure.
28th June	Plates and Films: their Development and After Treatment.
28th July	Printing, Toning, Mounting, and Finishing.
28th August... ..	Artistic Effect and Composition.
29th September	Outdoor Instantaneous and General Photography

All MSS. to be addressed to the Editor, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE PROPRIETORS of the *AMATEUR PHOTOGRAPHER* will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP),

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	June 14.
LANDSCAPE WITH FIGURE	July 14.
GENRE OR FIGURE STUDY	April 14 ... Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, — ANIMALS, ETC.	May 14 .. Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the PROPRIETORS, and all the prints sent in shall become the property of the PROPRIETORS.

In addition to the Medals being given, the prize photographs will be produced in the *AMATEUR PHOTOGRAPHER*.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Competitive prints are available for exhibition before Photographic Societies after the 1st of each month.

The prints will all be numbered, and when sent to societies, will be accompanied by a book for criticism. It is hoped that the President or other official will give a note stating the general opinion of the members of the Society.

Entry forms on receipt of stamped addressed envelope.

And fills with life the Album page,
While Five-guinea Cameras groan with rage."

THE "DEMON" CAMERA

Is made entirely of polished nickel silver, each part being stamped out by expensive machinery, the cost of which, to make the first one, exceeded one hundred pounds, therefore it is only the enormous number we are now turning out that enables us to supply this beautiful piece of workmanship at 5/.

Many people might imagine that the Demon Camera is only a toy, the price being so low, but hundreds of testimonials daily testify to the value of the apparatus and the success of purchasers. We derive no profit from the sale of the Cameras, each one costing us 5/., but we reckon to make 200,000 new customers for dry plates and other photographic sundries, and thus eventually repay ourselves for the outlay.

Read the following—

14, WRIGHTON ROAD, ABERLEY.
Dear Sir—I bought one of your "Demon" Cameras in Glasgow, and am highly delighted with it. I obtained three instantaneous pictures from the window of the Great Northern Express, travelling at fifty miles an hour, and they are perfect. Please send some of your lists, as my friends will not believe my negatives are produced with a five-shilling camera.
S. STEVENS.

[PRICE TWOPENCE.]

✿ OUR VIEWS. ✿

To hold as 'twere the mirror up to nature."—*Shakespeare.*

WE are pleased now to be in a position to publish the awards of the gentlemen who have so kindly undertaken the heavy duties of judging the photographs contributed to the AMATEUR PHOTOGRAPHER Fifth "Prize Tour Competition." The following is the list of prize winners:

Gold Medal.—The Rev. Precentor MANN, "Three Weeks in Brittany."

Gold Medal.—PAUL LANGE, "A Tour in Norway."

Both these gentlemen were awarded a medal for their photographs, entered by us at the recent Crystal Palace Exhibition, and their work is of such equal value that we place them both first, and award each the AMATEUR PHOTOGRAPHER Gold Medal.

Second (Silver Medal and £4 4s.).—MAURICE DE DECHY, "Old Playground in Tyrol Re-visited."

Third (Silver Medal and £3 13s. 6d.).—MARTIN J. HARDING, "In the Lledr Valley, N. Wales."

Fourth (Silver Medal and £3 3s.).—JOHN C. LIVINGSTON, "A Fortnight in Lakeland."

Fifth (Bronze Medal and £2 12s. 6d.).—FREDERICK ANYON, "A Holiday Tour."

Sixth (Bronze Medal and £2 2s.).—CYRIL S. COBB, B.C.L., M.A., etc., "Across India."

Seventh (Bronze Medal and £1 11s. 6d.).—A. H. BLANKLEY, "Waters New—the Kennett and Avon Canal."

Eighth (Certificate and £1 1s.).—E. J. JACKSON, "A Tour in Norway."

Ninth (Certificate and 15s.).—C. EMMANUEL, B.A., "In and about Lowestoft."

Tenth (Certificate and 10s.).—D. R. CLARK, M.A., "Summer Holiday in Fife."

In what form we shall reproduce the prize pictures is a matter that is having our very serious attention; we shall certainly require prints and possibly the negatives of all. Some few competitors have asked for the return of their frames. We should much prefer that they be left with us

for a time. If not, we must ask for a duplicate set of prints, in order that they may be criticised, and the selection made from them for reproduction and ultimate publication in such form as we may deem desirable. The duplicate prints would be the most convenient to us, and then the framed photographs might be returned *at once.*

* * * *

WE were pleased to notice that many of our competitors who entered their work in the general classes at the Palace received recognition. We know that to many the conditions of the AMATEUR PHOTOGRAPHER Fifth "Prize Tour Competition" appeared somewhat stringent, but we determined to have no photographs that had been exhibited before, and to close the competition against "pot-hunters." In this we succeeded, and had the extreme satisfaction of showing upwards of 400 photographs at the Crystal Palace that had never before been exhibited, every one of which was the unaided work of an amateur photographer. We venture to say that there has never been an exhibition before at which 400 virgin photographs have been exhibited.

We intend to persevere in the encouragement of new work, and shall take care that in none of our competitions work that has been exhibited before shall be entered, whether medalled or not.

* * * *

In a few weeks we shall be able to announce the appointment of several "District Editors." We would, whilst thanking many who have written suggesting gentlemen fitted to fill the position, state that we shall be glad to hear from any of our readers who may have suggestions to make and gentlemen to propose. The "districting" is being proceeded with, and we shall not be satisfied until we have an organisation as far-reaching and as comprehensive as that which has been so ably formed for the Cyclist Touring Club, through the untiring exertions of Mr. E. R. Shipton, the excellent Secretary of the Club.

* * * *

THIS "districting" or organisation is not new with us; we have had the matter under consideration for a long

time past. The necessities of the times have determined us, and we intend to "set our face like a flint" until we have accomplished the work. Forso comprehensive an undertaking we shall need help, and shall not, we feel sure, appeal to our many thousands of readers and well-wishers in vain. We would ask all those who can help us, and they are many, to let us hear from them as speedily as possible; we shall also be glad of any suggestions.

It is not intended that the present movement shall in any way interfere with the proposed scheme to establish a Photographic Institute, which only lies dormant for a while; in fact, it has been thought desirable to wait and see whether the Camera Club, when located in their new premises, will fulfil in any degree the intentions of the promoters of the Institute, and whether anything will come out of the schemes which are now under consideration by the Council of the Photographic Society of Great Britain.

* * * *

New photographic societies, some of a most important character, are being started. There are several new societies noted this week. The most notable is the Jersey Amateur Photographic Society, under the presidency of Captain T. Lamb. Several well-known amateurs figure upon the committee, and the work of the society indoors and outdoors has made a most excellent start. We trust the executive will extend to us the privilege of introducing visitors and allow the use of their dark-room, or better still, arrange a reasonable fee for temporary membership. The Secretary is Dr. Cumberland Taylor, 28, David Place, Jersey, who will be glad to give further particulars.

This temporary membership should commend itself to committees of societies in all seaside towns and touring centres. In the first place, there is the mundane consideration of increased revenue, and, secondly, the interchange of ideas and dissemination of information interesting to workers in photography.

* * * *

A SOCIETY has also been started at Lewisham. We publish a letter from the Secretary. At Leytonstone a society was started last year, and the Secretary will be very glad of new members. He calls attention to the beautiful, and in a great measure unexplored, photographic haunts in and around Epping Forest, and suggests a possibility of the members undertaking "a systematic photographic survey of the Forest and the villages adjacent to it." He has our hearty good wishes, and we shall be glad to hear that, through the insertion of his letter, many new members are enrolled. We would, however, remind him that although the Society has been established a year, we remembered so little of it, having during the winter season seen no reports of its doings, that we were under the impression that the Society was only just started. Secretaries of struggling societies should remember that there is a column in the AMATEUR PHOTOGRAPHER for the purpose of publishing their doings, and that the REPORTER is *facile princeps* the journal in which their proceedings should appear. The photographic public could then judge them by their works.

* * * *

WE are pleased to notice that there is a movement on foot to form a photographic society at Dover. A preliminary meeting has been held, and Mr. W. Osborne

Saul, New Bridge, Dover, will be pleased to hear from anyone wishing to aid the movement.

* * * *

WITH regard to the lantern slides contributed to our Lantern Slide Competition, all those for which an addressed envelope or label and stamps were sent will be returned not later than Monday next. The others will be retained and added to our collection. Copies of all the prize slides will be required, and a formal letter to each prize winner will be sent.

* * * *

ON Thursday evening Mr. W. A. Brown read a paper on the "Chemistry of Photography," illustrated with experiments, before the members of the Birkenhead Photographic Association.

* * * *

ON the 14th inst. the new Boston slides ("The White Mountains") and "The Hundred of Wirral" will be exhibited under the auspices of the Liverpool Amateur Photographic Association.

* * * *

THE Lewes Photographic Society this season intend to do some practical work, and will undertake a photographic survey of the town of Lewes.

* * * *

AT the recent exhibition promoted by the Y.M.C.A. Camera Club, Belfast, we are pleased to note that the AMATEUR PHOTOGRAPHER Silver Medal has been awarded to Mr. S. B. Coates, M.D., for landscapes, and the Bronze Medal to Mr. James H. Hamilton, for photographs of flowers.

* * * *

THE Newcastle-on-Tyne Exhibition is to be opened with much ceremony on the 18th inst. A feature of the function will be the delivery by Mr. Paul Lange of his exceedingly interesting lecture on Norway. We understand that the entries are quite as numerous as was anticipated, and there is every prospect of a most interesting and successful exhibition.

* * * *

THE Secretary of a Photographic Association who has had our "Enlargement Competition" on loan writes:—"They are a means of helping on any society, as was shown by the large attendance."

* * * *

IN answer to our remarks upon the "AMATEUR PHOTOGRAPHER Annual," we have been favoured with several suggestions. These are receiving very mature consideration. We shall be very grateful to our readers if they will kindly send us their views upon what the "Annual" should contain. It is certain that there is an ample field for an "Annual" devoted to matters of interest to amateurs.

* * * *

WE are pleased to notice that the *Daily News* are kind enough to draw attention to Mr. C. H. Bothamley's article on "The Optical Lantern as an aid in Teaching," which appears in the April number of the PHOTOGRAPHIC QUARTERLY.

* * * *

IN accordance with what may now be called "ancient custom," we shall be pleased to receive short articles descriptive of "Holiday Resorts and Photographic Haunts." The MSS. should not exceed 1,000 words, or be less than 500. The

model for these articles may be found in the back numbers of the AMATEUR PHOTOGRAPHER. We shall commence the publication of them in the first week in May, and shall be glad of early "copy." At the end of the season we shall give a prize for the best and second-best article published.

* * * *

THE NEW ENGLISH ART CLUB.

If the reader happens to be passing Humphrey's Mansions, Knightsbridge, he will do well to turn into the premises of the New English Art Club, and spend a short time among the pictures which adorn the walls of the four spacious rooms which form the Gallery of its members.

The collection as a whole may be said to manifest energy and originality; there is very often a breaking away from conventionalities of conception and treatment that is distinctly refreshing and breathes hopefully for the future. Yet there is no denying that much of the work exhibited is remarkable for nothing except its mediocrity, and one cannot help feeling that the selecting jury of the Club have not exercised sufficient severity in the suppression of such productions as have absolutely no claim to be called art—whatever be the point of view from which one regards them. Their idea seems to have been to cover all the walls of their rooms with frames; they would have done better to have covered less wall space with superior quality.

Inasmuch then as there is a great deal that may be passed over without notice, it becomes the more necessary to point out those pictures which are worthy of attention. Just as a personal fault in an acquaintance forces itself into notice far more obtrusively than a virtue, so a bad picture will often catch the eye more readily than a good one, and on entering the first large room, known as "The Salon," the attention of the visitor cannot help being arrested by No. 2, a canvas purporting to represent "A Northern Shore," the sea breaking on a sandy shore where sea-gulls hover. But what sort of a sea is this? A petrified cotton-wool sea, conveying nothing of the idea of motion, nothing of the grandeur and the poetry of the rolling billows, but a hard meaningless, motionless ocean. Here, indeed, is a case in point for Mr. Rossi—an instantaneous photograph of the sea might have taught this artist much, and the photographer, whoever he may be, who is the author of the charming sea pieces often on view in Spooner's window in the Strand might give the "artist" of "A Northern Shore" many points, and win "hands down" so far as artistic excellence goes.

But let us turn away from this painful picture to Mr. Walter Sickert's admirable work, No. 9. This is a full-length portrait of a lady (dressed, unfortunately, in a somewhat unbecoming costume) standing in a darkened room, with the light streaming in, one hardly knows from where, and lighting up her right shoulder (she has her back towards the spectator and her head turned towards her left shoulder), her hair and the side of her face turned away from the spectator, so as to throw up her profile against the dark background, while the side of her face that one actually sees is still in shadow. The effect is most original, and the artist is to be congratulated on having achieved a success, by the production of a composition the conception of which is full of audacity.

No. 12 is a picturesque and taking little interior by Millicent S. Grose, the figure of the mother rocking the cradle strikes one, however, as being a trifle stiff.

No. 17, by A. Ludovici, jun., is a realistic picture of London street life, and it is perhaps hypercritical to say that the exceedingly clean street forms rather an excess of foreground; at any rate, Mr. Ludovici has caught that peculiar haze in the atmosphere which is seen nowhere but in London, and in this respect he triumphs over the artist of No. 35, the composition of whose picture "Edgware Road" is, perhaps, in other respects preferable.

The next picture that is worth attention is No. 25, the portrait of a lady practising upon a piano in a drawing-room; the portrait is wonderfully life-like, and leaves nothing to be desired, so natural is it. But the photographer would find it difficult to realise in what possible position the artist could have placed himself in order to get this particularly peculiar view of the drawing-room. There is a sort of crooked look about the arrangement of the furniture; and the rows of empty chairs neatly arranged against the walls would remind one of a lodging-house if it were not for the elegance of the upholstery. Mr. Sidney Starr is the artist, and so it is unnecessary to point out the admirable way in which the furniture and accessories are painted, and one can easily forget the defects of the picture in contemplating its evident excellencies. Close by is No. 27, a realistically repulsive portrait of Mr. Bradlaugh.

No. 34 is the gem of the collection. It is a full-length portrait of a lady, and the originality of the scheme of colour and the refinement that is marked in every touch places it beyond praise. The pose of the figure is in itself a study, and it would well repay any photographer whose predilection lies in the direction of portraiture to visit the Gallery in order to see this picture only.

There is one of Mr. T. Wore's Japanese pictures in this room, No. 36. In Room 4 there is another, No. 130; both were evidently painted on the spot, and manifest a considerable amount of care and pains, but are if anything too elaborately finished, and, curiously enough, recall the method of Memling.

Passing on to Room No. 2, "The Yellow Room," notice No. 44, "On a Summer's Day off Bamborough," by Nelson Dawson, a very soft, tender little seascape, with a really beautifully rendered sky. The collection is not rich in landscape, but No. 62 is a breezy bit, and No. 59 is worth a glance, and has merits, as also has No. 127, in Room 3.

Nos. 51, 52, 53 are studies of a little girl by Jacques E. Blanche. They are certainly instructive, though perhaps not very attractive. In No. 51 especially, one cannot help remarking the exceedingly uncomfortable and inelegant position in which the artist has chosen to portray the unhappy-looking child, who certainly could not have preserved her pose with comfort for more than ten seconds consecutively. Not even the veriest tyro in photography would have exposed a plate on his subject so placed. Yet the picture itself is, in some way, redeemed by the clever colouring; it is an arrangement in blues, and as such must be considered a success. No. 52 is similar, but the position of the child is not so distressing; yet in all three of his pictures the artist seems entirely to have disregarded natural attitude and the beauty of line and curve.

With No. 76, "The Amethyst Cloud, Jungfrau," one feels disappointed. Mr. Stott's work exhibited at the Grosvenor, though on a smaller scale, brought home the glory and the beauty of Alpine scenery far more truthfully than his present work now exhibiting at the New English Art Club. The picture is too large, yet, while it is large,

it fails either to convey the size of the majestic Jungfrau or the atmospheric effect which the artist designed. It conveys to the photographer the idea of a badly enlarged photograph, and one cannot help thinking that it is essentially a studio-painted picture.

Mr. William Hunt's "Carting Straw" is terribly hard and unsympathetic; he should take a course under Dr. Emerson. Nos. 60, 71, 72, and 79 are pretty little water-coloured sketches of Spain and Algeria, and are worth a glance; so, too, is No. 87, a purely imaginary picture by A. Roche.

In Room 3, No. 96, "File Cutters," is good and truthful, though the figures are a little too crowded. No. 100 is a charming moonlight scene by Moffat P. Lindner, and although the houses on the left are architecturally quite hideous, yet the general effect of the picture with the light streaming through the windows and reflected on the water where the fishing boats are lying at anchor is very realistic, and the artist has certainly made the most of his subject. No. 105, "Bad Weather," by Fred W. Jackson, is the best seascape exhibited, the composition being admirable. Some fishermen and women are dragging a boat up on to the beach under the lee of a breakwater, against which the waves are impatiently beating, and the whole atmosphere of the picture betokens the approach of dirty weather. It is instructive to compare the painting of the waves in this picture with No. 65. There is nothing else noticeable in this room except a couple of full-length portraits, both of ladies in green dresses, of which No. 126 is the best; while No. 113 can be looked at only as a set off against the admirable portrait in Room 1 (No. 34).

In Room 4 we have "A Slant of Evening Light in Polperro Harbour," a delightfully well thought out study—one of the best compositions exhibited, and a style of picture quite within the powers of an artistic photographer, and altogether most suggestive. No. 140 is a good snow scene, but one of those pictures where the foreground extends more than half way up the canvas, conveying to a photographer that the artist forgot to use his rising front.

No. 148, "Lily," by James Guthrie, has found great favour with the critics, and it must be left to the visitor to say whether he considers it a satisfactory production. No. 150 is a charming little landscape entitled "Slender Trees that Kiss the Sky," and is full of feeling. No. 163 is truly Emersonian. No. 164 is hung too high to enable one to appreciate it. No. 165, the portrait of an old lady nursing a child, savours too much of the stiff attitudes and staring eyes that marked the professional portrait photographer thirty years ago. No. 168 is a clever bit of painting. If the reader has not time to look at all the pictures mentioned, let him, at any rate, not fail to see Nos. 9, 25, 34, 44, 100, 105, 134; these are the cream of the collection.

On the whole, the New English Art Club is to be congratulated on this exhibition. We, as photographers, can hold out the hand of fellowship to the members of the Club and encourage them to persevere in the road along which they have made so excellent a start, for they (with a few notable exceptions) have realised at least one of the truths artists are ready to acknowledge, that they owe in no small measure to the advance of photography along the artistic path, namely, that "nature out-of-doors cannot be mimicked by paintings in a studio, and that to handle a subject dramatically it is not necessary to be theatrical."

Letters to the Editor.

CRYSTAL PALACE CHALLENGE CUP COMPETITION, AND THE NEWCASTLE-ON-TYNE AND NORTHERN COUNTIES PHOTOGRAPHIC ASSOCIATION.

SIR,—We approach this subject fully aware how unpleasant the task usually is of championising our own works, and this alone would have induced us, under any other circumstances, to leave matters as they stand in the Crystal Palace Club Cup Competition. But the glaring injustice of this extraordinary award involves the duty of warning the photographic world against encouraging its repetition.

We have so much proof of the Cup having been misdealt with in this present case as to amount to a positive *embarras de richesse* when it is necessary to reduce it to a sufficiently compressed space for presentation before your readers.

Previous to determining on entering for this Challenge Cup Competition, we carefully perused the entire rules appertaining to it, as forwarded to us for that purpose, and found it to be thoroughly open, with absolutely no restriction as to amateurs or professionals only competing, no limitation as to size or class of photograph, and no mention even that pictures which had been previously exhibited in individual classes at the Crystal Palace were not eligible. Carefully abiding by these rules, we selected and sent seventy-five pictures, more than forty-five of which had already received awards; twenty-four lantern slides and six stereoscopic slides, most of which had also previously been medalled.

We received the following acknowledgment and acceptance of our exhibit, under date of February 26th:—"Your papers to hand, and we are much obliged for the great care you have taken. We must just point out that Mr. Gibson has included two pictures with the same titles as previously sent; also Mr. Lyd. Sawyer has again sent the 'Boat-builders,' though shown here in '88, and the 'Castle Garth,' shown here last year. As we cannot admit pictures more than once, perhaps they would like to substitute others."

This was, of course, tacitly accepting all our exhibits with the exception of the four pictures mentioned. These latter were sent because we found that there was no rule debarring them, and because it was as reasonable to accept pictures for the Challenge Cup class which had been shown in individual classes last year as to accept pictures shown in individual classes this year. However, on receipt of this letter, Mr. Gibson and Mr. Sawyer each wrote to the executive separately, requesting that the four pictures alluded to should be placed aside until the end of the exhibition, and Mr. Sawyer forwarded two others in place of those of his objected to.

Subsequently, we received another letter from the same source, of which the following is a sufficient extract, dated March 8th:—"Your Club exhibit has arrived safely, and all pictures are hung. I think you will be very pleased with the show."

If all our pictures were hung, in face of two separate requests from us for four of them to be withdrawn, it suggests that either they were after all accepted as admissible by the executive, or else that they were still hung as a weak plea for afterwards disqualifying us. Which was it?

We next hear of our pictures through *Photography* of March 20th, which states, "At the time of writing this we do not know the awards, but, to our minds, Newcastle—by reason of having at least five noted professionals represented—stands far away ahead. Next must come the Liverpool Amateur, which is represented by an excellent lot of pictures."

Writing later, in the same number, *Photography* again says, "It will be seen by our report that the Society Challenge Cup Competition at the Crystal Palace has fallen to Birmingham. It is rather a significant fact (*vide* report) that when the award was announced on the sheet it appeared as 'Three Cheers for Birmingham.' Before expressing any further opinion on the matter, we should like to know if any societies were disqualified, and why?"

The AMATEUR PHOTOGRAPHER for March 21st contains the following anent the Cup Competition:—"Next year probably some conditions will be laid down by the management, for surely it cannot be an equal competition when one of two alcoves occupied by the Newcastle Society is filled by the work of two such men as Gibson of Hexham and Lyd. Sawyer."

Now, one of the extraordinary parts of this quotation is that

we have reason to believe it was written by one of the Judges of the Cup Competition, and although it says plainly that our exhibit was too good for the rest, yet the Cup has not been awarded us! We know that we cannot be honestly disqualified, and, as stated in our previous letter which appeared in your columns, we challenged an explanation, and stated that we had good authority for knowing that only a portion of our pictures was judged.

The following reply from the Executive, dated March 24th, was duly received:—"In reply to your letter of 21st inst., I have the honour to refer you to our letter of 26th February ult., and to Rules 6 (note to Rule) and 16 marked and enclosed. You can have no authoritative information except through the hands of the Executive, consisting of Mr. Peasgood and yours faithfully, S. G. Buchanan Wollaston."

This is very nice and decisive, if we were prepared to accept it, and if there was no higher tribunal than these same Messrs. Peasgood and Wollaston to appeal to. But we did not take the trouble to make and send our exhibit only to be dealt with as their whims or interest dictated. There is a higher tribunal in the shape of our photographic *confrères* to lay the matter before.

Here, then, let us analyse their lame attempt at justification. "Our letter of 26th February" refers to the one above quoted, in which they objected to two pictures sent by Mr. Gibson and two sent by Mr. Sawyer. As Messrs. Gibson and Sawyer each individually wrote asking for these four pictures to be withdrawn, this fact ceases to have any bearing upon the case. The "Note to Rule 6" referred to, says:—"N.B. The Executive reserves all rights as regards the hanging of pictures, and may refuse to display any picture without assigning reasons for so doing."

This rule in no manner applies to us, as, according to their own statement of March 8th, all our pictures were accepted and hung; but whether or not this includes the four pictures objected to we cannot say, and as it was a matter entirely resting in their own hands, we are not legitimately affected by it.

Rule 16, as underlined by them, says:—"From the decision of the judges there can be no appeal." Very proper, so far as it goes, but more remains behind. They continue, "You can have no authoritative information except through the hands of the Executive," etc. That is official-like, but, unfortunately, it is not or should not be true. The Judges are (or, shall we in this case say, should be?) the first authority in these matters, and it is from one of the Judges we learn that Messrs. Gibson and Sawyer's pictures (not the four of them in question, but all or nearly all) were left unjudged; hence, as the Judges did not decide on all our exhibits, it is not a complete decision, and need not be final. Now what can your readers infer from this array of facts? The letter of the Judge (a man of known integrity and eminence) was not sent us for publication, so we refrain from any possible breach of confidence by further locating it, and we have an amount of other confidential correspondence touching on the subject.

It remains for us to apologise to you for the unavoidable length of our communication, which, we trust, may come, at all events, with some negative appropriateness to the present discussion on rules and regulations at exhibitions.—We are, yours very truly,

HAND-CAMERAS AND STEREOSCOPIC WORK.

SIR,—I have long been hoping to find among the numerous hand-cameras in the market, that the idea had been successfully applied to the stereoscopic form, but so far I have been disappointed.

As a makeshift I have used two Kodaks clamped together, and by enlargement from the negatives very excellent transparent slides have been produced, but in practice it is difficult to liberate the two shutters at the same moment, and therefore I am anxious to find something better.

During the past two years I have corresponded with two or three leading firms on the subject, and from the replies received I fully expected that one or two cameras of this form would be offered. There can hardly now be any doubt about the revival of interest in the stereoscope, and a hand-camera producing stereoscopic negatives on films would probably soon become very popular. If any are already made, I, and no doubt many of your readers, shall be glad to hear of them, or to learn that it is the intention of some of the best makers to give the subject their attention.—Yours, etc.,
Rb. Rb.

April 1st, 1890.

* * * *

YELLOW STAINS CAUSED BY HYDROQUINONE.

SIR.—You published last week a letter from Mr. W. E. Reynolds, in which he recommends a solution of potassic iodide and auric terchloride for the removal of the yellow staining which invariably occurs when using hydroquinone as a developer.

I have not tried this myself, but I am glad to see that he mentions at the same time, what to my mind is a serious objection to the use of this remedy. In the first place, if I understand him correctly, the print must be *thoroughly* washed, then treated with the iodide and gold, which turns it all manner of colours, and finally requires prolonged soaking to eliminate the blue iodide of starch. All this means time wasted, as in the ordinary course of events when a print is thoroughly washed it should be ready for drying.

Hydroquinone is a capital developer for bromide enlargements or prints, and also for lantern slides, and one need not mind seeing a little yellowness after development, as it can be easily removed in a much more simple way, in my opinion, than that suggested by Mr. Reynolds. I have seen the staining on lantern plates and negatives quite as much as on bromide paper, but it is, of course, much more noticeable in the latter. It resembles in many respects the yellowness produced by pyrogallie acid and ammonia as regards its distribution and behaviour. The pyrogallie stain, however, is readily removed by acidulated water (preferably made with sulphuric acid), which is called a "clearing solution." The hydroquinone stain, on the other hand, is not in any way touched by acids, but quickly disappears on treatment with a dilute solution of cyanide of potassium. I am convinced that cyanide of potassium and water, about 2 drms. to the pint, forms the proper clearing solution for hydroquinone, as it does all that is required of it in a thoroughly efficient manner, and much in the same way as the acid after the older form of development. The advantages are: it can be used soon after fixing; it acts in a few seconds, and cleans the paper thoroughly, leaving the whites perfect; and can be used either for paper or plates only requiring ordinary washing afterwards. Properly employed it should not reduce the density of the print any more than the acid clearing solution after development by pyro and ammonia.

—Yours faithfully,

W. AMBROSE KIBBLER.

April 7th, 1890.

SIR,—Though the letter of Mr. W. E. Reynolds was very interesting and most instructive, I think that, "prevention being better than cure," it would be well to know how to avoid these accidents if it is possible.

As far as my experience goes, I believe the stains referred to are due to one of two causes. They are occasioned by the prolonged development required to gain the requisite density, which is the result either of under-exposing the print or using too weak a developer. It happens in development with eikonogen as well as with hydroquinone, but is not due really to either of these, but to the accelerator used.

The best way to avoid the stains in future is to increase the exposure, if that is to blame, and take care the developer has not been too much impoverished by previous development.

If I am wrong, I hope some better authority will do me a kindness by setting me right.—I am, etc.,
SUCCESS.

PHOTOGRAPHIC SOCIETY FOR THE POTTERIES.

SIR,—In reply to the letter in your last issue from Mr. W. Wilberforce Beach, we feel no little astonishment that he should consider amateurs from the Potteries should not have a society of their own, but should go to some place outside their districts.

Suppose amateurs from Burslem joined the Newcastle Society, they would have a walk of four miles to attend the meetings, which is more than Mr. Beach has any right to expect. Surely the population of the Potteries, which is over 200,000, can support two societies. We cannot but admire the modest assurance of Mr. Beach in asking amateurs from the potteries to send in their names to him. We wish the Newcastle Society every success, at the same time we believe that another society is much needed, and shall do our utmost to make our society a great success.

Our chief reason for starting this society has been because of the distance of Newcastle from Burslem and Tunstall.

We are holding our first meeting this week, and from the promises of support we have received we feel no doubt as to the result of our efforts. We can assure Mr. Beach that we have not brought forward this society in any spirit of antagonism, but will gladly do what we can to co-operate with the Newcastle Society in anything that lies within our power.—Yours, etc.,

F. C. POWELL,
J. F. HEWITT.

Burslem, 5th April, 1890.

* * * *

LEYTONSTONE AND EPPING FOREST PHOTOGRAPHIC SOCIETY.

SIR,—May I call attention to the Society whose title appears above? I am convinced that there are numbers of amateur workers in our district who only need to be informed of the existence of such a Society to become members at once. I am writing to invite all such to join us.

We are making an effort to increase our membership, and consequently our power for useful work. The proximity of the Forest, and its photographic possibilities, afford alone sufficient *raison d'être* for our Society; and when it is remembered that there is no other in the neighbourhood, it should, I think, receive the hearty support of all local amateurs, not excluding professionals.

We have comfortable rooms for meetings, besides a conveniently-fitted dark-room. The subscription is small, and chiefly goes towards a fund for the purchase of apparatus for members' use. Our head-quarters are at the Fillebrook Lecture Hall, Fairlop Road, Leytonstone, three minutes' walk from the station, and very convenient for all who travel up and down the Loughton line. We shall be glad to see visitors at our next monthly meeting, on Wednesday, April 16th, at 8 o'clock, when Mr. A. Whitman has promised a paper, practically illustrated, on "Chloride of Silver Emulsion Papers," to be followed by a discussion on "Artistic Photography," opened by the Secretary.

I shall be happy to give any information through the post.—I am, Sir, yours truly,

JOSEPH W. SPURGEON (Hon. Sec.)

1, Drayton Villas, Leytonstone, Essex, April 3rd, 1890.

* * * *

LEWISHAM HIGH ROAD CAMERA CLUB.

SIR,—A preliminary meeting was held at the Congregational Lecture Hall, Lewisham High Road, on the 1st inst., when thirteen members were enrolled, and the Club duly constituted.

The next meeting takes place on Tuesday, April 15th, at 8 p.m., when we shall be glad to see ladies and gentlemen wishing to join. The subscription has been fixed at a very low sum (5s. per annum), so as to present no obstacle, and it is to be hoped we shall soon see a large increase in our numbers.—I am, etc.,

40, Sandbourne Road, Brockley, E.C.

B. DAVIDSON.

April 2nd, 1890.

PHOTOGRAPHY MADE EASY.

SIR,—I know that what I am going to say is not new, but it does not seem to have attracted the attention it deserves, therefore I hope you will forgive me for trespassing on your space. My wish is to assist those who require it. It is really marvellous that, considering all we know, have seen and heard, and the sociability and communicability of the dabbles in the art, there are so many of us working in the dark, straining our eyes, upsetting and breaking our bottles, lamps, chimneys, and plates, when we might easily avoid all these discomforts at a very small cost.

It is a hard thing for a photographer of experience to judge of the density of a negative by the darkest of ruby lights; how much more must it be to one who has not had much experience! To him the disappointments must be very numerous and discouraging. All this can be avoided, and real pleasure take the place of the

previous torture. Ruby glass in lamps should be abolished, it only damages the sight; and in its place should be a thinner piece of plain glass, outside of which three thicknesses of canary medium (the yellow calico sold by all dealers) should be slid into the groove with the glass. The most rapid plates will not be affected by the light. It is impossible for me to express the relief I felt when I first made the change. My lamp is a triangular one, with a metal back on one side, another side has the three thicknesses of canary medium, and the other two folds. The latter light I use when development has gone on considerably. Anyone can now judge density to a nicety, and have plenty of light to see everything in the room. I use the most rapid plates I can get, and nearly all my work is with a detective camera. In developing Edwards' isochromatic sixties, I cover them over for a time until their sensitiveness is so reduced that they can be uncovered with safety.—I am, sir, yours faithfully,

EXPERIENCE.

* * * *

OBER-AMMERGAU.

SIR,—Photography is permitted in Germany, but in public parks, museums, etc., it is better to ask permission of the "Polizei President."

German custom agents are *very polite* if you are polite with them, and will let pass your plates without any difficulty. You can get plates *en route* in all large cities, and I believe in best condition. In Munich I recommend you May and Widmayer, 5, Promenaden Pl., or Otto Wernhard, 24, Sonnen St.—I am, sir, yours truly,

ROBERT TALBOT.

April 5th, 1890.

ALPHA PLATES.

SIR,—We may be permitted to reply on this subject, and say that we believe that the finger marks are not made in course of manufacture, but by users unconsciously touching film when looking to see which is the coated side, not having noticed this when opening the box.

Out of the many thousands of gross sent out, we have had only four complaints, and have not met with the fault in our own experience. We would point out to your correspondents that the same hands coat and pack our ordinary plates, and we therefore fail to see why the Alpha should be inferior in point of manufacture. We should just like to add that we deem it scarcely fair to us as manufacturers for users of our plates to send such letters until we have been written to. We are at all times happy to give all letters of complaint our courteous attention, and, failing clear proof that the user is at fault, to give him the benefit of the doubt, and exchange the goods of which he complains.

If users of the Alpha plates have found the "face to face" method of packing injurious to the film, we can only say that this has not been our own experience, nor have we had more than one or two cases of the sort brought to our notice. If our experience has been exceptional, and those who think the plates would be better packed otherwise would write to us, we will consider the matter according to the weight of evidence, and consult the wishes of the majority, as we have always done since we first placed a good plate at a popular price on the market.—Yours, etc.,

THE BRITANNIA WORKS COMPANY.

SIR,—I notice several letters respecting "Alpha" lantern plates, with which I thoroughly concur. About six months ago I wrote to the Britannia Works Company to say that I thought it a pity that their lantern plates, otherwise so splendid, should be spoiled by bad packing.

Their answer was, that, after many experiments, they found the plan adopted better than any other, and that mine was the only complaint that had reached them. I thought I might have got a damaged box, and tried again from a different dealer, with the same result.

I find most of the plates with some sort of scratch, and some with holes quite through the film, usually in the centre of the plate, made most probably by fragments of glass getting between the plates, which are simply packed face to face without anything between them. With this exception they seem to me to be perfect, as it is so easy to get a good slide of any colour you wish.—Faithfully yours,

J. M. KEOGH.

7, Elma Terrace, Merriem Road, March 31st, 1890.

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

(Continued from page 216.)

THE CHEMICAL ELEMENTS.

THE number of the chemical elements—simple bodies which so far have not been decomposed, or out of which nothing has been obtained different from themselves—is between 70 and 80. The exact number is uncertain, because the existence of several new elements, although rendered highly probable by the evidence already obtained, has not been clearly demonstrated. In the following list only those elements are included, the existence of which may be regarded as definitely established.

The Chemical Elements, their Symbols and Atomic Weights.

		H = 1.	O = 16			H = 1.	O = 16
*Aluminium ...	Al	27.0	27.1	Nickel ...	Ni	58.6	59
*Antimony ..	Sb	119.6	120.3	Niobium ...	Nb	93.7	94.2
Arsenic ...	As	74.9	75.0	*Nitrogen ...	N	14.0	14.0
*Barium ...	Ba	136.9	137.0	Osmium ...	Os	195	192
Beryllium ...	Be	9.1	9.1	*Oxygen ...	O	15.96	16
Bismuth ...	Bi	207.5	208.0	*Palladium ...	Pd	106.2	106
*Boron ...	B	10.9	11.0	*Phosphorus	P	31.0	31.0
*Bromine ...	Br	79.8	80.0	*Platinum ...	Pt	194.3	194.8
*Cadmium ...	Cd	111.7	112.1	*Potassium ...	K	39.0	39.1
Caesium ...	Cs	132.7	132.9	Rhodium ...	Rh	104.1	103
*Calcium ...	Ca	39.9	40.0	Rubidium ...	Rb	85.2	85.4
*Carbon ...	C	12.0	12.0	Ruthenium	Ru	103.5	103.8
Cerium ...	Ce	141.2	140.2	Samarium ..	Sa	—	150
*Chlorine ...	Cl	35.4	35.5	Scandium ...	Sc	44.0	44.1
*Chromium ...	Cr	52.5	52.3	Selenium ...	Se	78.9	79.1
Cobalt ...	Co	58.6	59.0	*Silicon ...	Si	28.3	28.4
*Copper ...	Cu	63.2	63.3	*Silver ...	Ag	107.7	107.9
Didymium ...	Di	145	—	*Sodium ...	Na	23.0	23.1
Erbium ...	Er	166	166	*Strontium ...	Sr	87.3	87.5
*Fluorine ...	F	19.0	19.0	*Sulphur ...	S	32.0	32.1
Gallium ...	Ga	69	69.9	Tantalum ...	Ta	182	—
Germanium ...	Ge	—	72.3	Tellurium ...	Te	126.3	125
*Gold ...	Au	196.8	197.2	Terbium ...	Tb	—	—
*Hydrogen ...	H	1.0	1.0	Thallium ...	Tl	203.7	204.1
Indium ...	In	113.4	113.7	Thorium ...	Th	232.0	232.4
*Iodine ...	I	126.5	126.9	*Tin ...	Sn	117.4	118.1
*Iridium ...	Ir	192.5	193.2	Titanium ...	Ti	48.0	48.1
*Iron ...	Fe	55.9	56.0	*Tungsten ..	W	183.6	184.0
Lanthanum ...	La	138.5	138.5	*Uranium ...	Ur	239.8	239.4
*Lead ...	Pb	206.4	206.9	Vanadium ...	V	51.1	51.2
*Lithium ...	Li	7.0	7.0	Ytterbium ...	Yb	—	173.2
*Magnesium ...	Mg	23.9	24.4	Yttrium ...	Y	89.6	88.7
*Manganese ...	Mn	54.8	55.0	*Zinc ...	Zn	64.9	65.5
*Mercury ...	Hg	199.8	200.4	Zirconium ..	Zr	90.4	90.7
Molybdenum ..	Mo	95.9	95.9				

* Elements which are or have been used in any form in photographic processes are distinguished by an asterisk. Other elements may be used in new processes.

This list is in no sense final. We are as yet unacquainted with a considerable part of the earth's surface, and we know almost nothing of the composition of the earth's crust to a greater depth than two or three miles, and therefore it is highly probable that new elements will be discovered. In fact, not a year passes without the discovery of two or three new elements being announced, but these alleged discoveries are not always substantiated. It is also quite within the range of probability that some of the bodies now regarded as elements will prove to be compounds when we acquire more powerful methods of decomposition, such as higher temperatures or stronger electric currents.

Opposite the name of each element is its *chemical symbol*, consisting, as a rule, of the initial letter of the name, or the initial letter and some other letter which also occurs in the name. A symbol consisting of one letter is given only to elements which are very abundant or important. In order that the same symbols may be used by chemists all over the world, they are taken from the Latin names of the elements, and not from the English names. It follows that where the English and Latin names differ, the symbol may not consist of letters which occur in the English name. This happens to be the case with many elements which are used in one form or another by photographers, and therefore a list of them will be useful: antimony=stibium; copper=cuprum; gold=aurum; iron=ferrum; lead=plumbum; mercury=hydrargyrum; potassium=kaliu; silver=argentum; sodium=natrium; tin=stannum; tungsten=wolframium. It is also noteworthy that all these elements were known at a comparatively early stage in the history of chemistry.

The symbols of the elements constitute a very convenient chemical shorthand, the use of which will be explained more fully later; the significance of the numbers placed opposite each element will also be explained.

The names of the elements sometimes have reference to their mode of occurrence, sometimes to one of their most pronounced properties; in many cases they are purely fanciful.

Most of the elements are solid at the ordinary temperature; two, mercury and bromine, are liquid; five are gases—chlorine, fluorine, hydrogen, nitrogen, oxygen. They are generally divided into two groups, *metallic elements*, or *metals*, and *non-metallic elements*, or *non-metals*. All the common metals—iron, copper, lead, tin, zinc, silver, and gold—are elements; and all the other elements which resemble them in physical and chemical properties—i.e., have a metallic lustre, conduct heat and electricity, and form oxides which can neutralise acids—are likewise classed as metals. All the metals are solid, with the exception of mercury, which is liquid at the ordinary temperature. The gaseous elements and others, such as sulphur, carbon, and phosphorus, which have none of the appearances or properties of metals, are classed as the non-metallic elements. They are fifteen in number, viz., arsenic, boron, bromine, carbon, chlorine, fluorine, hydrogen, iodine, nitrogen, oxygen, phosphorus, selenium, silicon, sulphur, tellurium.

The division into metals and non-metals is not sharp and well defined; some elements are decidedly metallic and some are decidedly non-metallic, but there are others which have some of the properties of non-metals and some of the properties of the metals. These form connecting links between the two divisions; arsenic, antimony, titanium, tin, and vanadium are amongst the best known cases.

The chemical elements are the materials from which all the various forms of matter are built up by the process of chemical combination or synthesis.

Chemical combination is the union of two or more substances to produce a new substance of more complex constitution.

Notice that this definition includes not only the union of elements to form compounds, but also the union of two or more compounds to produce one of a more complicated character.

We must now ascertain the conditions under which chemical combination will take place, and the laws by which it is regulated.

Whether elements will combine or not depends in the first place on their nature. As a general rule, we may say that the more dissimilar two elements are, the greater is their tendency to combine. Non-metals combine with

metals more readily than they combine with one another, but to this rule there are many exceptions. Definite combination between two metals is rare. Some elements show very great chemical activity, and readily form combinations of various kinds, but others, both non-metals and metals, but especially the latter, show very little tendency to enter into combination at all, and form compounds which are very unstable and easily decomposed.

Chemical combination, in fact, depends, in the first place, upon the existence of a peculiar force of the nature of an attraction, which we call *chemical attraction* or *chemical affinity*, and so far as our present knowledge goes the different elements are endowed with this force in very different degrees.

It depends also on the temperature. In many cases combination takes place at the ordinary temperature as soon as the substances are brought into contact; chlorine and bromine, for example, readily combine with many metals; recall also Experiment 13.

In many instances, however, the substances must be heated before combination will take place. We have found this to be the case with copper and sulphur (Experiment 22), and we shall meet with many other examples later on. Heat is, in fact, one of the most useful agents in promoting combination as well as in producing decomposition, an apparent contradiction which will become more intelligible when our knowledge of the subject reaches a somewhat more advanced state. It is found that some substances will combine readily enough at the ordinary temperature, but will not unite if they are strongly cooled by means of a freezing mixture.

In some cases combination is caused by the action of light; chlorine and hydrogen will not combine at the ordinary temperature in the dark, but combine gradually in diffused daylight and rapidly with explosion in bright sunlight.

Latterly experiments have been made which seem to show that in some cases at least the combination of two substances is dependent on the presence of a third body, which however does not itself permanently enter into the compounds which are formed. This point and the action of light will be discussed more fully subsequently.

(To be continued.)

Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

APPARATUS.

(Continued from page 219.)

Camera Case.—Purchasers of a photographic outfit are recommended to pay some attention to the case in which it is to be carried, or probably their subsequent practical experience may cause them to regret the oversight. Some definite idea of the principal work for which the camera is being procured, and of the circumstances under which it may have to be employed, should be formed before any decision on the subject is arrived at. If the camera is intended chiefly for studio work, then the material and shape of the case are details of small importance, but if it is designed for landscape work or to be an accompaniment of one's travels, then they become sufficiently momentous to deserve consideration. The size of plate it is intended to employ is also a feature not to be overlooked. For any of the smaller sizes a neat leather or strong waterproof case with a shoulder strap is a serviceable article, but for any of the larger sizes, the weight of a leather case renders it

undesirable. Moreover, the solid leather cases the dealers in photographic appliances frequently recommend are not only cumbersome and heavy, but often unnecessarily expensive, in some instances the prices quoted being more than sufficient to elsewhere purchase a good sized portmanteau. It must be remembered, however, that cases made of waterproof cloth or other pliant material, although being everything that can reasonably be desired on the score of lightness, yet lack the requisite strength to afford the protection required if any rough usage has to be encountered, or for which provision has to be made.

As no suitable material is available whereby the requisite strength can be found in combination with the requisite lightness, it is a good plan to have two cases, one for ordinary occasions and the other where portability is the principal consideration.

After considerable experience in the matter, we unhesitatingly recommend the following plan in the event of an extended tour being contemplated. Purchase a waterproof canvas bag leather bound, such as the Army and Navy Stores manufacture, large enough to hold the full kit and having outside straps. The camera and all the necessary appurtenances can be packed for travelling in a portmanteau, and the clothes or other articles they displace can easily be accommodated in the bag. In this way the fragile portion of the apparatus receives the necessary protection at the time it is required. When the place is reached at which the camera is wanted for use, it can be transferred to the bag, and as this receptacle is made of the very lightest material possessing the necessary durability, the kit is in as portable a form as it is possible to have it. The outside straps can be employed in strapping the tripod to the bag, and in this way one article only has to be carried, which enables a certain amount of relief to be obtained by alternately shifting the burden from one arm to the other.

As the weight of a photographer's kit should be within such limits that it enables him to be independent of assistance, if necessary, when it has to be carried any distance, it is under certain circumstances a good method to have the means whereby it can be divided into two or more packages; a focussing cloth of good dimensions, as previously recommended, and a rug strap can be easily utilised for this purpose; or, if the excursion is a pedestrian one, over mountainous ground, it is well to bear in mind the fact that the heavier portion of the apparatus can be easier carried on the back in a light knapsack of waterproof material than in any other manner. Another fact that should never be lost sight of when arranging an excursion, is, that whether the kit has to be carried by the photographer or by some one engaged for that purpose, it is only an exceptionally strong man that can carry for any distance a weight exceeding fifteen pounds if care has to be exercised in its handling. This circumstance should therefore be a guide to the maximum weight of the whole *impedimenta*, for if it be exceeded the equipment practically ceases to be a portable one.

As it is unwise to always rely upon the memory, an inventory written out on a small card of all the articles the bag should contain to make the kit complete should be kept in an available place and be referred to when packing.

Lenses.—Reference will be made in a subsequent division of these articles to the various makes of lenses, and other matters thereto relating.

Remarks concerning Photographic Apparatus.—In the foregoing pages devoted to the subject we have called attention to all the absolutely necessary pieces of apparatus which must in some form or another become part of a photographer's outfit before he can be considered to be in a position to commence making negatives. We have also endeavoured

to assist him in making his selection among the various patterns by pointing out the features that should be deemed requisite. The next subject that will engage his attention will be the dark-room and the sensitive plates he proposes using. These features of photography will therefore be referred to in chapters specially devoted to them. We purpose, however, before quitting the subject of apparatus, to refer to sundry articles, which, although not absolutely necessary, are, nevertheless, under certain circumstances, of great utility, and with whose use the photographer should therefore be familiar.

It may, however, be as well to state, for the benefit of the inexperienced, that it is not wise to rely upon the employment of appliances which cannot be classified among those as absolutely essential. Even where they are of considerable use, yet it is well to learn how to dispense with their services. The photographer who can reduce his *impedimenta* to the fewest pieces, and work with the most simple mechanisms, is the one destined to find the most pleasure in the employment of his camera. In all probability, he will also do better work than one possessed of every possible implement that can be required under any given contingency, and whose camera is supplied with every conceivable convenience its ingenious manufacturer could devise. The camera being simply the means to an end, the possession of an elaborately beautiful article no more constitutes a good photographer, or necessitates good work, than a gorgeous shooting coat will mak a sportsman or preordain its owner having a good aim. If a camera has those features to which we have referred as being essential, its possessor, never mind whose make it is, can feel assured that just as good work can be done with it as can be done by the owner of the most expensive article the manufacturers can supply.

Every piece of apparatus belonging to the equipment should be periodically examined, to see that it has not sustained injury and for the purpose of remedying any defects that may be found to exist. The proverb that inculcates the lesson to be drawn from the statement that "a stitch in time saves nine" is more than applicable to the possessor of a photographic kit, for minute defects therein have not only a tendency to rapidly increase, but may in themselves defeat the most carefully matured and skilfully executed plans of the photographer. A slight unobserved warping of the woodwork, an accidental puncture by a projecting screw, unsuspected moisture through being stored away in a damp place, a blow or the dropping of a lens, and various other, in themselves, trifling incidents, are yet, to a photographer, events that may be charged with the direst calamity to the work of a laborious day, for if unremedied, any one of these accidents may mar all his otherwise painstaking efforts at negative making.

(To be continued.)

Our Contemporaries at Home and Abroad.

The *British Journal of Photography*, in an article on "A Substitute for Hypo as a Fixing Agent," says, "The difference would be just this: In the hypo-fixed prints, whether insufficiently fixed or insufficiently washed, the impurity remaining in the print would be a sulphur compound, and as such liable to produce in decomposing, not only yellowness of the whites of the prints, but also true fading, or partial disappearance of the image from its conversion into a sickly yellow sulphide. Exposure to light has never, so far as we are aware, been observed to produce any darkening effect on such imperfectly treated proofs, though, of course, ordinary atmospheric influence may be expected to hasten whatever action may be lying dormant. In the case of a chloride-fixed print, whether imperfectly fixed or

insufficiently washed, the resulting impurity would consist of a soluble double chloride of silver and the base of the fixing salt. Imperfect fixation would of course leave more or less unaltered silver chloride, and this, as well as the double salt formed on fixing, would remain amenable to the action of light, and the deterioration of the print, when it occurred, would partake of a general darkening rather than yellowing or fading. Indeed, if protected from all access to light there is little reason to suppose that such prints would undergo any serious deterioration; as neither the pure silver chloride nor the double salt is particularly liable to spontaneous decomposition. It is even possible that an imperfectly treated proof by this method of fixing might, at any subsequent period, be placed in a position of safety by repeating the various operations, provided of course that no signs of incipient change had made their appearance." Articles: "Painted Photographs," "The Art of Retouching," "On Things in General," "A Powerful and Uniform Source of Illumination," "On Some Effects in Binocular and Monocular Vision," "A Farther Note on Eikonogen," etc.

The *Photographic Record* says, "It is well known that the tone of transparencies is affected by a prolonged or short exposure and development, but that the colour of prints is to some extent dependent upon the weakness or strength of the gold toning bath is not so widely recognised. A toning bath that works rapidly will give blue tones; one that works slowly, red or brown tones. This comes from the fact that fine metallic gold precipitated rapidly is a decided blue colour, while gold that is precipitated slowly is red. It therefore follows that to give a purple tint to albumen prints, the original washed prints should be a little reddish, and a gold toning bath should be used that works rapidly. If, on the other hand, reddish or brown tones are desired—as for landscapes—then a slow-working gold bath should be used. We may add to the foregoing, as all experienced photographers know well, that to simply use a strong solution of gold will not in itself ensure the production of the purple tones which are so often admired; the gold being but one of the component points to be taken into consideration. The substance used as an inductor to the gold, the depth of printing, the make of sensitised paper used, the fixing bath, and even the quality of the negative are all constituents affecting the end sought." Articles: "Binocular Vision and the Stereoscope," "Photographic Survey," "The Annual Exhibition," "The Lantern Slides."

The *Photographer* (Glasgow) says, "To ensure success in the production of palladium prints, nothing is required but to print deeply and wash thoroughly, to use a very dilute and slightly acid solution of the palladous salt, and fix in 'hypo' containing just enough ammonia to smell of it, giving each batch of prints a new bath. The finished print has somewhat the appearance of a drawing in India ink, especially if done on Whatman's paper. Palladium is a rare metal; its price is quoted in a list I have by me at 25s. per drachm, while the solution of palladous chloride is 3s. per ounce. But considering the minute quantity used in the production of a photographic print, the price perhaps is of little consequence. I am aware that the method of procedure is not new, but the use of palladium in 'toning' is, I believe, a novelty." Articles: "Dry Plate Photography for Beginners," "Photography on Glass, etc.," "The Practical Printer," etc.

The *Practical Photographer*, in an article on "Photography as a Business," says, "The dark-room, then, should be as large as you can afford; not less than 10 feet by 8 feet, but nearly double that size if possible. There should be plenty of table room and two Doulton sinks. If, however, there is room for one only it should be large. Air should be admitted through the floor as well as high in the wall or ceiling. There are plenty of light-obscuring ventilators to be had now. The window should admit three degrees of light. White light, over which should slide a frame containing ruby glass covered with yellow paper or fabric. This should give ample light, moderately safe for ordinary plates, but there should be another ruby glass provided in an additional slide to add to the normal light when isochromatic plates are employed, and they are coming daily more into use. This slide should be made easily movable, as it may be dispensed with towards the end of development." Articles: "Photographic Travellers," "Celluloid and other Films," "The Stephen Grey Fund," etc.

The *Photographic Art Journal*, in speaking of "The Reduction of Over-Dense Negatives," says, "The best method of procedure

is as follows: Take the quantity required to cover the negative to be reduced, of the ordinary hypo fixing solution, which may be assumed to be about 1 in 5. Add to each ounce of this, before immersing the negative in it, about three or four drops of a saturated solution of the red prussiate. The negative is immersed in this, and the dish rocked, when the density of the negative will be gradually removed; if a white porcelain dish be used, the action can be more easily followed. If the reduction slows, add a few more drops of the ferridcyanide, when it will make a fresh start, and so by gradual and tentative additions the reduction will proceed equally, and be perfectly under control. When a sufficient loss of density is effected, the negative has simply to be well washed to free it from the hypo solution, and the process is complete. Any amount of reduction can be effected down to absolutely bare glass, by increasing the quantity of the ferridcyanide, and by the aid of a camel's-hair brush, local reduction can be most successfully effected. When the reduction is very local in character, such as the removal of halation or the toning down of a too white garment, perhaps the best procedure is to paint over the parts that are to be reduced on the *dry negative* with the plain hypo solution, and it is then quite easy to accurately follow outlines. When the gelatine has imbibed the hypo, a drop or two of a weaker solution of the ferridcyanide is added; this instantly flows over the wetted part only, and the reduction is effected there equally. The advantage of this method of procedure lies in the fact that if the mixed solutions were applied at once, they would commence to attack the spot to which they were first applied, and the reduction would be unequal; whereas by first applying the hypo, the action is uniform only on the wetted parts. When the local reduction is considered sufficient, and if the first addition of the ferridcyanide does not do its work, more should be added; the spot should be suddenly sluiced with a good discharge of water; by this means the reducing solution is instantly washed off the plate before it has time to attack the other portions of the negative." Articles: "Exhibition Regulations," "Residues," "What to Do," "Control in the Density of Negatives," "On one or two Tenets of the Naturalists," "Photographic Convention, 1890," "Lecture on Colour and Photography," etc.

Science Notes.

THE appearance during the last three or four years of claimants for the honour of having discovered "photography in natural colours" reminds us of that arch humbug Levi Hill—the *Reverend* Levi Hill, as he loved to style himself—who "played it off" so successfully on the professionals of the United States forty years ago.

Hill announced his success in 1851, and exhibited his specimens (they were daguerreotypes which he had cleverly coloured by hand) to Morse, Root, and other well-known operators, obtaining from several of them, strange to say, testimonials in favour of his claim. He was a good daguerreotypist, a fluent talker, and a ready writer, and when he announced his intention of publishing his "great discovery" in a book—"for subscribers only"—the dollars flowed in freely.

Year after year passed, but no book appeared, for Hill was engaged in "perfecting" his discovery. At last the reproaches and threats of the public became unbearable, and Hill's book appeared in 1856. It is chiefly a *rechauffé* of the work of Hunt, Herschel, Becquerel, and Niépce de St. Victor, but it *does* contain a chapter purporting to give an account of Hill's own method of photographing in colours.

No human being, however, could possibly survive to put a plate through all the operations described in that chapter! To say nothing of the involved and obscure language employed, the rare chemicals named as to be used, and the multiplicity of operations required would exhaust any half-dozen average photographers. "One down, another come on."

But Hill had (so he said) done all that he had promised. He had published his book. There was his method, and if his subscribers could not succeed with it as well as he had done, it was their fault and not his. After this achievement the Rev. Levi Hill lapses into obscurity, but we have a record of his death in New York in 1865. He has not lacked imitators to keep his memory green.

Talking of *green*, that is the very colour which the Austrian "colourist," Herr Veresch, finds himself unable to reproduce in his photographs in natural colours. Why does he not apply to the correspondent of the *Standard*, who appears to possess a stock of the commodity, judging by his telegrams with reference to this latest "discovery"?

What apparatus to take when "on tour" is the question which appears to have been most discussed by workers preparing for the Easter holidays. For my own part I have selected a light whole-plate camera with four double-backs, and a hand-camera carrying twelve plates in sheaths. The total weight, with tripod, comes to twenty-four pounds, and I can manage this by myself if necessary, but I generally enlist the services of some native "to the manor born," who also comes in useful as a guide and as a model.

I spent an afternoon with my hand-camera at a football match recently, and with the following results: Plates exposed, twelve; of which four were good, four were fair, and four failures. This is about the average for such work. A "release" attached to the detective camera—as a stud which should require only a slight pressure—is much better than a pneumatic tube and bell. The latter wants a third hand to work it; and the only way of obtaining this addition that I know of, is to put the ball into the mouth—not always a pleasant dodge.

It is my belief that half the "total failures" recorded by the ordinary amateur are due to over-exposure plus under-development. At this time of the year half a second is full exposure for rapid plates on "ordinary landscape" with stop $f/32$, while with ordinary plates not more than one second should be given. And in developing, begin with a weak solution, and gradually strengthen it, allowing the plate to remain in the dish till the image is "well in" and opaque—or nearly so—by transmitted light, while the surface is a greyish-black all over by reflected light.

Herr Liesegang's proposal to use magnesium chloride instead of hypo, for the clearing of our gelatine plates, is well worthy of a trial. Ordinary common salt—sodium chloride—will clear a plate, but at the same time somewhat reduces the image. In either case the necessity for subsequent washing is not done away with, as if either chloride be left in the gelatine, it will absorb moisture from the air and keep the surface of the plate damp—a result which is not likely to be conducive to permanence.

The Eastman Company has purchased seven acres of land near Harrow, a few miles out of London. Here the new rollable celluloid film for the "Kodaks" will be manufactured, and the Kodaks themselves, in all sizes, up to 7 by 5, will be made. In this way not only will the delay which has often been experienced in obtaining supplies from the American factory be obviated, but the import duty on the raw material at present paid when entering the States, and the expenses of carriage both ways, will be saved.

In connection with the meeting of the Photographic Convention at Chester in June, an enthusiast proposes an excursion to the top of Snowdon. This would require, however, the better part of two days. Still, the suggestion shows a laudable desire to "elevate" the Convention, and to give its members an opportunity of rising in the world. The last time we made the ascent, we left our whole-plate camera at the foot of the "hillock;" but a light camera would have been a very desirable companion, and would have enabled us to perpetuate some of the views opened up to the weary pilgrims on and near the summit.

F. G. S.

TUNBRIDGE WELLS AM: PHOT: ASSOC:—On the 2nd inst. the members of the above association invited their friends to view the Boston lantern slides. Mr. G. Percival Smith, who presided, stated these slides had been made by the members of the Boston Camera Club (U.S.A.), and presented by them to the Liverpool Association. Mr. A. W. Pierson kindly exhibited them with his oxy-hydrogen lantern, the Hon. Secretary reading the lecture. Afterwards Mr. Pierson passed through the lantern a miscellaneous selection of slides, including some of the members' slides, and some made by himself by collodion process. Since the last meeting Sir David Salomons, Bart., has most kindly sent the association one of his slide rules, and also some copies of his "Photographic Notes," for distribution among the members, and his "Systematic Exposure Note Books."

Notes from Liverpool.

(From our District Editor.)

MR. PAUL LANGE, President of the Liverpool Amateur Photographic Association, who is to open the Newcastle Show on the 18th inst., has been asked to give his charming lecture, "Norway," on the occasion. He will be supported by the Mayor and a distinguished company. It may not be generally known that Mr. Lange is one of the judges at Newcastle.

"Amateur" writes to a Liverpool contemporary deprecating the attack of Mr. A. W. Beer, an ex-President of the Liverpool Society, on Mr. Lange. But "Amateur" need not have gone to the trouble of a retort. Mr. Beer's petulant communication to the paper in question was generally accepted as most grotesque and amusing.

A large contingent of Liverpool amateurs availed themselves of the opportunity during the holidays to continue their studies afield. Wales was a favourite resort.

It is stated, by the way, that in the course of the coming season the Isle of Man will be well "jaunted" and "done" by northern and midland amateurs.

A Big "Developing" Night at Liverpool.—On Wednesday night last week "Development" was the subject of practical demonstration at the Liverpool rooms. Between sixty and seventy members were present, and the meeting, which was very useful, lasted nearly three hours.

Mr. J. A. Sinclair led with remarks to the effect that while he was anxious not to "scare" beginners with abstruse chemical formulae or difficult scientific problems, yet it was desirable that something should be known of the action of light on a photographic plate, and also what was the aim of development. An intelligent grasp of the subject obviated much groping in the dark, and tended directly to greater success in the art of photography. Suppose, after the exposure of a plate in the camera, no change had apparently taken place. Again, suppose it were coated with a film containing bromide of silver. The light had a decomposing action on such a film, and a proportion of the bromine was given off. The actual composition of the reduction product which formed the invisible image was not clear. The next step was to make the image visible, and to this end a compound that acted on the portions exposed to light different to that on the portions not so exposed must be used. An alkaline solution of pyrogallol acid would quickly reduce the invisible image to metallic silver. But such a solution would not only reduce the invisible image but also, in less degree, the unaltered silver bromide in the film. To prevent this it was necessary to use a "restrainer." Such a substance was bromide of potassium, which it was believed formed with the unaltered silver bromide a more stable compound. He was inclined to the opinion that in increased quantities this "restrainer" united to some extent with the reduction product which formed the invisible image. An eminent chemist, however, had recently stated that it had no such action. It had been his (Mr. Sinclair's) experience that an over-exposed plate could be considerably modified by a restrained developer. The reduction product on the surface of the film did not supply all the silver deposit on the finished negative; but they need not go deeper into the subject at that stage. Whatever developer was chosen, the operator should fully understand it. With the "pyro" developer it was important to remember that the pyrogallol acid was the reducing agent, and that its action was accelerated by the alkali and restrained by the bromide. For negatives he did not consider anything could equal pyro and ammonia for all-round work. It did not give pretty negatives but such as were suitable for good prints in silver or platinotype. The powerful nature of the alkali makes it more serviceable than washing soda for work rather under-exposed.

Mr. Illingworth afterwards spoke on "Hydroquinone," and Mr. Lange on "Pyro and Washing Soda." Negatives were developed by each of the processes, much interest being evinced in the operations. The subject is to be continued next Wednesday, 16th inst., when Mr. W. Tomkinson will take the chair.

Liverpool Exhibition, 1891.—Writing late, our District Editor sends us a few of the new and more important features in connection with the conditions, etc., affecting the contemplated show in Liverpool.

Pictures from outside the United Kingdom may be sent unframed, packed in boards. These will be framed temporarily free of cost.

There will be no charge for wall space.

The name of the exhibitor, with the title of the exhibit, must appear plainly on the picture, mount, or frame; and thus, as nearly every known worker of standing has his own style, "as it were almost a trade mark," the restriction hitherto in force is abolished.

No prizes or medals will be admitted except those struck off the dies of the Liverpool Amateur Photographic Association.

Pictures of any description which have been previously exhibited in public competition in the United Kingdom will not be allowed to compete. Exception will be made in favour of the Photographic Society of Great Britain as regards the Parent Society's (1890) Pall Mall Exhibition, and private exhibitions confined to members of Photographic Associations will not count as public competitions or exhibitions.

Lantern slides must be sent in duplicate. One set will be exhibited on the tables, for which, free of charge, special frames and proper lighting will be arranged. The second set will be used on the screen for judging, and occasional demonstration during the run of the exhibition.

Photographs must be the *entire* work of the exhibitor: "posing, or selection of subject, exposure, development, retouching, printing, and toning."

In the case of firms, or companies, the exhibitor must be the single individual (working partner, assistant, etc.), the actual operator who has done the entire work.

A special class will be ascribed to hand-camera work. This it is intended shall be open to both amateur and professional workers.

The above will show the tendency at Liverpool. In our next issue we shall probably give more details.

The Competition Stereoscopic Slides lent by the AMATEUR PHOTOGRAPHER to the Liverpool Society are excellently placed in the society's room, where they command much interest and admiration.

The Liverpool Society holds an Official Lantern Evening in the City Hall, Eberle Street, next Monday. Part I. will consist of the showing of 150 slides, scenes in the "Hundred of Wirral," taken by members of the Liverpool and Birkenhead societies. Mr. John Hargraves will lecture thereon. In Part II. a series of scenes in the "White Mountains," lent, and matter supplied by the New Boston Club, U.S.A., will be shown.

On Saturday next the Liverpool members have an excursion to Rabymere, one of the most rustic and picturesque parts of Cheshire.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

ON Thursday, March 27th, Mr. W. Willis read a paper entitled "Platinotype Possibilities." Captain Abney occupied the chair.

Previous to the lecture, Mr. Chapman Jones exhibited and described his Memorandum camera, and Mr. Ferrero showed a convenient apparatus he had constructed for reducing to lantern-slide size.

Mr. Willis's address covered the following points: (1) A mixed oxalate, a phosphate developer for the hot-bath process, and the quality of image resulting therefrom; (2) A developer for sepia paper to give a warmer colour; (3) Hints as to washing prints; (4) Effects to be gained by the use of papers of various surface and texture; (5) Application of the cold-bath process to fabrics. Some of these heads were illustrated by examples, more especially that relating to fabrics and rough-surfaced paper.

An interesting discussion followed, in which Captain Abney, Messrs. Greene, Davison, Wellington, Cembrano, Elder, Ferrero, Humphrey, Chapman Jones, and Clark took part.

On Thursday, April 3rd, lantern slides by members and friends were shown, the contributors to the exhibition being Messrs. Ferrero, Cembrano, Wellington, Webber, and Grimshaw.

On Thursday, April 17th, Mr. W. Adcock will open the subject "Amateur and Professional," for discussion.

Societies' Meetings.

BEDFORD AND DISTRICT CAMERA CLUB.—At the adjourned general meeting held on Wednesday, the 2nd inst., the following gentlemen were elected on the Committee—Mr. T. G. Bryant, Mr. W. O. Kirby, Captain G. C. Swan, and Mr. C. E. Wareing. Mr. R. P. Stuart showed those present some of his photographs taken abroad, and Dr. Beaman showed some work done with the Kodak, which were much admired.

BRECHIN PHOT. ASSOC.—The usual monthly meeting of members and friends of this Association was held on the 2nd inst. In the absence of the Vice-Presidents, Bailie Lawrence occupied the chair. The President, Mr. Adamson, Causton Castle, read a paper on "Hand-Cameras." From his wide experience with these, he was well able to give hints as to the movements which were necessary and convenient in these instruments. He advised doing away with all forms of double backs, as necessitating too much trouble changing between exposures. For general convenience, Rouch's Eureka was a good camera. He deprecated the use of fixed-focus lenses for general work. View-finders were very useful sometimes, but not at all necessary; indeed, they were occasionally harmful, as one's eyes were on them when they should have been observing the subject. He strongly advised all those going in for this class of camera to spend their money on the lens, and not on the dark-box, treating also on the various classes of lenses which could be used, and giving their respective advantages and defects. The conclusion he had come to was that for a quarter-plate camera a lens of from $4\frac{1}{2}$ ins. to 5 ins. focus was the most useful. A camera made to his own specification by Mr. Hume, of Edinburgh, was to have been exhibited, but it had not come forward in time. A few cameras were shown and explained to the meeting, including Shew's Eclipse, the Kodak, Mayfield's Pocket Camera, and Underwood's City Detective. Hume's cantilever enlarging apparatus was also on exhibition, and was much admired for its compactness, good workmanship, and reasonable price. Messrs. James Smart, manufacturer, and Chas. Mitchell, jun., were admitted members.

JERSEY AM. PHOT. SOC.—At a meeting held on the 2nd inst., the following members were elected to hold office during the current year: President, Captain T. Lamb; Vice-President, Alfred Messervy; Council, Mrs. Haddon Smith, Messrs. J. H. Burcham Rogers, J. Andrews, F. W. Toms; Treasurer, George Le M. Gruchy; Secretary, Dr. H. Cumberland Taylor. Notice was given that Mr. Burcham Rogers would commence a discussion on "Printing Processes" at the next informal meeting, to be held on the 16th inst. at 3 p.m. An excursion was arranged to take place on the 10th inst. under the leadership of Judge Messervy to the beautiful and ancient Manoir de Saint Onen, kindly permitted by its owner, Col. E. C. Malet de Carteret. After having decided on a list of the leading photographic periodicals to be regularly taken in for the reading room, the President called upon Dr. Taylor, the Secretary, to give an address on "Field Work." He began his discourse by enumerating the various apparatus necessary, and then proceeded seriatim with a description of each, pointing out advantages and defects in construction, management of the swing-back, both for architectural objects and for portraiture, the various lenses in use, stops and their focal values, with especial reference to the selection of a stop for a given subject. He then described the relative positions and proper places for the principal, the secondary, and the subordinate objects in a well chosen picture, demonstrating the manner of properly focussing foreground, mid-distance, and extreme distance, giving the best position for line of horizon, and explaining the pyramidal grouping, arrangement on the diagonal, and balancing point of the picture. The uses of view finders and of view meters followed, and a beautiful specimen of a meter, constructed specially by Mr. Dallmeyer, was exhibited to the audience. Dr. Taylor produced a very fine rainband spectro-scope, made by Mr. Browning, the optician in the Strand, which he said in skilful hands gave much valuable indication of the hygrometric state of the atmosphere as well as of the clearness and actiniccy of the light, both for exposures and for printing purposes. The address was followed by a lantern exhibition of slides made by the President and exhibited by the Vice-President and Treasurer, arranged to illustrate the various errors likely to be committed by beginners, and which had already been alluded to by the lecturer in his address. The usual vote of thanks having been proposed to the lecturer and duly seconded, the latter briefly acknowledged it, and the proceedings terminated.

KEIGHLEY AND DISTRICT PHOT. ASSOC.—On the 1st inst. an address was given to the members of the association, in their rooms, by the Rev. T. Mellorey, M.A., the subject being "Hints on Photographing Interiors," with reference chiefly to church architecture. With regard to the light, the lecturer considered a rather dull day was best, and a south or south-west light most suitable. The east window was sometimes a trouble, owing to the excess of light causing halation. Two plans were suggested for softening the light: (1) darkening the outside of the window with sheeting, (2) taking a separate negative of window with an exposure of a few seconds, and resorting to double printing. If the light from the side windows be too strong, a judicious placing of the camera might interpose pillars between windows and lens, and so shut out the glaring light. The best lens was one of the rectilinear type, having a focus equal to the length of the plate; but in cramped situations, and for monuments, etc., a wide-angle lens was a *sine qua non*. Care should be taken to have the camera perfectly level and the swing-back absolutely vertical, or falling pillars would be the result. With regard to exposures, the lecturer gave his experience, varying from 12 to 45 minutes, and explained that it was sometimes necessary to prolong the exposure even beyond an hour. It was seldom advisable to use a smaller stop than $f/32$, and for focussing it was a safe plan to select a well-lighted object in the middle distance, and then stop down. To obtain a view to embrace nave and east window the camera should never be placed in the centre of the aisle, but at one side, with lens slightly pointing to the opposite side. Slow development was strongly recommended as giving the best results for interior negatives, and as a means for avoiding harsh contrasts. The amount of pyro should be slightly reduced at the beginning, and the developer strengthened when the details were well out. At the close the lecturer invited the members to ask questions on what he had said or upon anything he had not touched upon. Several members availed themselves of the invitation, and an instructive discussion followed.

LEWES PHOT. SOC.—The ordinary meeting was held on the 1st inst., the President in the chair. Mr. E. Miller had promised to open a discussion on "Pinhole Photography," but owing to indisposition was unable to be present, and Mr. G. J. Wightman kindly took his place. A very interesting discussion ensued, and specimen negatives and prints were passed round for inspection. The Society is about to commence a photographic survey of Lewes and environs, to be carried out as far as possible during the coming summer, and it is intended to produce a set of lantern slides which can be sent to any other society in exchange for a similar set. The first excursion of the season will be to Newhaven, on April 24th. At the next meeting on May 6th, Mr. J. J. Hollway will read a paper on "Cloud Photography."

METEOROLOGICAL SOCIETY.—The ordinary meeting was held on the 19th ult., Mr. H. F. Blanford, V.P., in the chair. The following papers were read: "A Brief Notice respecting Photography in Relation to Meteorological Work," by Mr. G. M. Whipple. The first person to use photography for obtaining meteorological records was Mr. T. B. Jordan, of Falmouth, in 1838. Some years later Sir F. Ronalds and Mr. C. Brooke devised more elaborate apparatus, the arrangement of the former being now in use at the observatories of the Meteorological Office, and that of the latter at Greenwich. Reference was also made to Mr. T. B. Jordan's form of sunshine recorder, and to Captain Abney's photo-nephograph. The various photographic processes which have been employed in connection with these instruments were fully described. "Application of Photography to Meteorological Phenomena," by Mr. W. Marriott. The author showed how photography could be most usefully employed for the advancement of meteorological knowledge. After the reading of these papers the meeting was adjourned, to allow the Fellows to inspect the exhibition of instruments, etc., illustrating the application of photography to meteorology. Specimens or drawings of nearly every photographic meteorological instrument and records from the same were shown, and a collection of photographs of clouds and other meteorological phenomena. The photographs of clouds taken by M. P. Garnier, of Boulogne-sur-Seine, were exceptionally fine. A number of new meteorological instruments were also shown, as well as an ingenious working model devised by Mr. A. W. Claydon for showing the connection between the monsoons and the currents of the Arabian Sea and the Bay of Bengal.

REDCAR AND COATHAM PHOT. ASSOC.—The general meeting was held on the 1st inst., for the election of officers. The

AMATEUR PHOTOGRAPHER Competition Photographs were on exhibition, attracting an unusually large attendance of members. The many fine pictures among this collection were much admired.

ROSSENDALE PHOT. ASSOC.—On the 31st ult., under the auspices of this Society, a large number of persons assembled in the Club Rooms, at Rawtenstall, to see the **AMATEUR PHOTOGRAPHER** "Enlargements." The President said, "Whatever might be said against trade medals, there is this to be said in favour of the **AMATEUR PHOTOGRAPHER** Competitions, that to the Society who have them placed at their disposal they form a great attraction, and provide an opportunity for a little social chat, whilst the quality of the work is not below par." During the evening a series of papers on "Printing Processes, with Demonstration," were delivered as under:—Ferro-prussiate, Mr. Jos. Ashworth; silver printing, Mr. W. Chadwick; platinotype, Rev. N. W. Shrewsbury; aristotype, F. W. Pilkington. Mr. Ashworth dwelt on the chemical changes which took place, whilst the other gentlemen directed attention to negatives to which the respective papers were more especially suitable. The next meeting is to be an exhibition of cameras, with tests for rapidity in setting up and packing of them, together with a discussion on the advantages and disadvantages of each piece of apparatus exhibited.

SHEFFIELD PHOT. SOC.—The usual monthly meeting of this Society was held at the Masonic Hall, on the 1st inst., when it was agreed that the first excursion should be to Bolton Abbey and Woods. In reference to the late exhibition for the benefit of the Sheffield Hospital building fund, it was announced that the net amount to be given was £10 10s., along with £1 2s. 9d. given by Miss Doris Taylor. Mr. T. Hibbert laid on the table some

prints produced by the new Kallitype process, which gave very satisfactory results, after which Mr. R. J. Shields, of Mexborough, gave his paper. Subject: "Notes on a Tour in Norway." After passing a hearty vote of thanks, the meeting, which had been a very enjoyable one, terminated.

SOUTHSEA AM. PHOT. SOC.—An ordinary meeting was held on April 2nd. Lieut. F. W. Cobb, R.N., occupied the chair. The Chairman spoke of the success of the recent lantern-slide exhibition, and said the society had been asked to give a joint entertainment with the Minnesingers during the first week in May, in aid of the funds of the Eye Infirmary. It was decided that the Chairman should make the necessary arrangements, and that the Committee would assist. The Hon. Secretary then read a paper on "A Method of Obviating the Effects of Halation and Local Over-exposure in the Development of Negatives and Bromide Prints."

WOLVERHAMPTON AM. PHOT. SOC.—The usual monthly meeting of this Society was held on Tuesday evening, the 1st inst., in the Agricultural Hall, Mr. F. J. Gibson in the chair. Messrs. Austin, Brevitt, and Curtis were elected as members. Mr. T. W. Derrington gave a paper on "Stereoscopic Photography." Slides and stereoscopes were handed round by the lecturer, including a set of views kindly lent by Mr. W. Whitehouse, Dudley. Mr. W. Ratcliffe showed a fine set of twenty slides of Peruvian scenery taken by himself in 1864.

CORRECTION.—CRYSTAL PALACE PHOTOGRAPHIC EXHIBITION.—The Managers write, "Will you please announce in your next issue that the award in Section 4, Lantern Division, was made to Fred. H. Evans, and that Mr. Wado's initials should have been J. W."

To Correspondents.

THE insertion of **QUERIES AND ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made. All communications for the columns are to be addressed to The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3679. **Hydroquinone, Sediment from.**—In mixing up Ilford developer for hydroquinone formula as given by them, I find a white floury sediment has settled in the bottle No. 2, caustic soda and water. Is this due to the water used (New River), and will it affect quality of developer to the injury of the plates?—W. GARDNER.

3680. **Ilford Plates and Hydroquinone.**—Using Ilford rapid plates and hydroquinone developer, I have twice lately had negatives spoilt by being spotted all over, as if they had had small-pox. Can any reader account for this?—OWEN.

3681. **Clouds on Bromide Paper.**—Is it an easy matter to print in clouds in bromide prints? Would someone kindly give me particulars, as there must be some way. It would be difficult work, I fancy.—COLONIST.

3682. **Lynton and Lynmouth.**—I am thinking of visiting the above places about the end of May. Will anyone who has been there kindly tell me if apartments are easily obtainable, and give me some idea of the price asked for them? Is there a dark-room available at either place?—HOLIDAY.

3683. **Lens.**—Can any reader of the **AMATEUR PHOTOGRAPHER** kindly inform me whether I can use Marion's rectilinear lens in Lancaster's International camera? And also whether it is a good lens for all-round work?—T. S.

3684. **Lancaster's Rubralux Lamp.**—I have one of these lamps, but can only obtain the dark ruby light, which is too dense for developing purposes, and not the ruby and dark ruby, as advertised. Is this an old lamp of this class? What shall I do to obtain a medium light?—M'GINTY.

3685. **Hydroquinone.**—I intend giving this developer a trial. Will any amateur inform me which is the best, Ilford or Thomas's?—M'GINTY.

3686. **Enlarging.**—Which is the best paper for enlarging purposes (taking into consideration simplicity), and formula for same?—M'GINTY.

3687. **Isochromatic Plates.**—When using Edwards' isochromatic plates for photographing oil paintings, please explain fully how yellow screen is to be used. Answer to this question, No. 3648 in your last number, April 4th, leaves me as much in the dark as ever. Surely J. A. Sinclair does not mean screen is to be between lens and picture; also what kind of a yellow screen must be used?—W.

3688. **Blue Prints.**—Will any kind amateur tell me how I can get the blue prints, and what developers I must use, and where I can get the best albumenised paper for it?—NOVICE.

3689. **Toning.**—I tone with carbonate of soda—1 gr. gold, 4 grs. carbonate of soda, 6 ozs. water—and there is a chalky substance comes over them when toning. I have tried it at different strengths, but they all seem the same. Would anyone explain?—PRINT SPOILER.

3690. **Gold Solution.**—How much water is mixed with each grain of gold chloride to make a solution?—SOLUTION.

3691. **Cloud Negatives.**—Can someone please tell me particulars for getting good cloud negatives, and the best plates to use for the purpose?—CLOUD NEGS.

3692. **Want of Density in Negatives.**—Will any one kindly tell me how to remedy this, as I can very seldom get a negative dense enough, especially in the sky? I have tried various makes of plates, and generally the Ilford developer, but have tried Beach's and hydroquinone. Until lately I was never troubled with this, so do not think it is owing to wrong manipulation.—AN OLD READER IN TROUBLE.

3693. **Blue-Black Tones.**—Will someone kindly tell me with what plates and developer I can obtain cold black or blue-black lantern slides? I have tried the Ilford Alpha lantern plates with hydroquinone, and can only obtain brown and reddish results.—SINDEN.

3694. **Aristotype.**—With me Aristotype paper usually gets a pinkish bloom over it after toning, fixing, etc. Could someone kindly say how to prevent this? I use Ilford or mauve tint paper and Liesegang's bath, and some of the prints remain white or nearly so. Is this paper (a collodion-chloride or a gelatin-chloride; if the latter, why is

it often called the former; is there any collodion in it?—B. T. F.

3695. **Plates.**—Could someone kindly tell me of a good thickly-coated landscape plate of about the same speed as an Ilford ordinary? I use Thomas' landscape plates, but they are too slow; I consider them to take two or three times the exposure of Ilford. I would also like to know of a good quick plate, that gives no trouble in developing, about one-half quicker than Ilford, say 45 or 50 times.—B. T. F.

QUERIES UNANSWERED.

Feb. 21st.—Nos. 3471, 3476, 3478, 4391, 3493, 3404.
28th.—No. 3517.

Mar. 7th.—Nos. 3528, 3530, 3531, 3542, 3551, 3554, 3556.

14th.—Nos. 3561, 3566.

21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3601, 3610, 3612, 3613, 3614.

28th.—Nos. 3620, 3628, 3629, 3630, 3637, 3634, 3636, 3637, 3638, 3640, 3641, 3643, 3650, 3652, 3653.

April 4th.—Nos. 3661, 3662, 3664, 3665, 3666, 3671, 3672, 3673, 3674, 3676, 3677.

ANSWERS.

3683. **Swinden and Earp's Camera.**—I have used one of these cameras for several months, and although I have exposed more than 200 plates, have never had a single one discharged film side up. Hold the base of the camera in a horizontal position, or preferably inclined down at front end, to extent of, say, 5 degs. to 15 degs. If held at 50 to 75 degs., it is likely film side will come uppermost. The lens is a good one.—J. W. B.

3687. **Hydroquinone.**—If "Naukt-Poo" will employ fresh sodium sulphite, which should have a sulphurous, and not merely saline, smell and taste, and cork up the bottle in which the solution is made tightly before shaking, he will probably find it a remedy.—R. W. B.

3688. **Perspective.**—Expose more, use less pyrex (if you are employing it), and in any case more restrainer. But distant hills are always difficult to obtain, and, indeed, impossible without a very clear atmosphere.—R. W. B.

3670. **Finder.**—For a detective camera a box finder is most satisfactory. To make a convenient one for the lens and plate mentioned, obtain a lens about $\frac{1}{2}$ in. diameter, plano (or double) convex. If any difficulty is found in obtaining this, it could probably be got for 1s. 6d. to 2s. 6d. from Mr. W. Harding, 52, Gladstone Road, Boscombe, Bournemouth, to order. It should be 2 in. focus. Then make a tin or wood box $1\frac{1}{2}$ in. cube, with two adjacent sides open, and attach a truncated pyramid of the same material $\frac{3}{4}$ in. long and $1\frac{1}{2}$ in. in the base to one open side. The other end of this pyramid carries the lens in a bit of tube. A square of silvered glass placed diagonally in the box, and a piece of ground-glass

with a mask 1 in. by $\frac{3}{4}$ in. closing the remaining open side, complete the finder, which will embrace approximately the identical view. If a finder after the Aptus style be preferred, a watch-glass silvered inside and out square, placed diagonally, will be better than a concave lens, as it can be looked down on from above.—R. W. B.

3675. **Plate-Washer.**—I should say half an hour's washing in such a washer will be quite sufficient.—T. D.

3678. **Hockin's Lens.**—I have had the use of one of Hockin's quarter-plate R.R., and I may say I was very well pleased with it. Judging from the results, I believe I am justified in saying that you will not get a better lens for the very moderate amount which it costs. Six stops are supplied with this lens, the largest of which equals $f/6$.—T. D.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

MISS PHILIPSON.—Animals are not included in the "Ladies' Competition," except so far as they are accessories to the picture.

R. W. BUTTEMER.—We have taken steps which we hope will prevent a repetition.

G. CUTMORE.—Your opinion is a correct one, and we shall take care not to permit the advertisement in any subsequent issue.

HARRY HOLZ.—The art critic of the *Manchester Guardian* and the gentlemen who awarded the AMATEUR PHOTOGRAPHER medals are not in accord. At present we fear there is but little chance of our publishing your MS.

MISS M. A. HENDERSON.—The entry forms have been sent to you.

J. MILLER.—Very kind of you to send cutting. Should be very pleased if you would call; "at home" Mondays 2 to 5 p.m., Thursdays 11 a.m. to 5 p.m.

ALF. WATKINS.—The paper will appear in the PHOTOGRAPHIC SOCIETIES' REPORTER in full. We are writing you.

THOMAS AND CO.—We have sent you a copy of the letter we have addressed to the firm; we are afraid they are not prompt in business. If they do not now execute your order, send us a letter stating the facts, and we will publish it in next week's paper.

J. M. BUTLER.—Thank you very much; we shall keep your suggestion before us.

A. D. GUTHRIE.—Your kind letter with suggestions will receive our attention.

W. H. ARMITAGE.—For landscape or architecture use the former; when doing so you will require a long-focus camera. The portrait is sharp, the subject not carefully posed, the hands being out of plane. Your attempts at "tinting" are a failure.

T. C. HOSKING.—Our publishers have returned one of your advertisements, it being quite out of place in our Sale and Exchange column.

E. F. B.—(1) You will be quite safe in buying a lantern from either firm; perhaps preference may be given to B. (2) The second firm you name make a very good camera. We do not know how they compare in price.

J. ROSENTHAL.—"Eikonogen" will no doubt be cropping up in our "Letters to Editor" column before long. You cannot do better than buy No. 1.

W. H. B.—If you want a cheap lens, have No. 3. You cannot, of course, expect all the qualities of a first-class lens, but you will, we think, be certain of good definition. Buy the lens on the understanding that you try it.

G. H. MANT.—No. 1 is the most compact, cheapest, and reliable of those named. No. 4 has many good points, and in a week or so we hope to be able to speak definitely as to its working powers. No. 3 we have not seen. No. 5 we cannot recommend, and No. 2 we should prefer also to reserve our judgment on until the makers have given us an opportunity of inspecting their "latest improvements." Certainly use the lens you name, it is very specially fitted for hand-camera work.

T. W. WRAY.—We should place them 2, 1, 5. Nos. 2 and 5 can both be used on a tripod. With Nos. 2 and 1 very good lenses are sent out, to No. 5 any lens can be fitted. So, in fact, they can to either of the other cameras. Both are of excellent make; we rather incline to A.

M. H. N.—As far as we at present know we should certainly say No. 2. Why not try the plates? It will depend in a great measure how they have been packed, and where kept. The make of plates are unsurpassed; you should develop with the maker's formula. (5) If you purchase the camera we have advised, you will, of course, use glass. A hand-camera is one which is used, preferably, by holding in hands; a detective camera is one which is

sought to hide from observation, or to disguise, so as not to be recognisable as a photographing machine. The title is a misnomer, and the user of a disguised camera has but little sympathy or support from us.

INQUIRER.—We do not, of course, endorse the opinions expressed by advertisers, and so far as the special apparatus named, we cannot recommend it; at least, not to those who intend to take up photography with a view to picture-making.

ART STUDENT.—The letter has been sent on, and we have no doubt you will hear from our subscriber in due course. Your remarks upon the last "Home Portraiture" number are very encouraging. The address you want is Mr. A. R. Dresser, Springfield, Bexley Heath. We should advise you to buy a cheap quarter-plate set with K.R. lens as a start, and next season, or later in this, buy hand-camera No. 3. The lens you have with quarter-plate kit would answer for it. You could with this size make lantern slides by contact, and then project on the screen. If we can help you any more, write again. Buy "Experimental Photography" (Leaper) of our publishers. You won't want any lessons if you can get a friend to put you through your first few "attempts," and carefully study the book we recommend.

BOIS DE CHENE.—Sorry we cannot spare time to break our rule and write you. If you want the negatives for lantern work, and require a light and unobtrusive camera, we should advise No. 1. A more bulky but exceedingly efficient instrument is No. 5. About No. 3, we do not like to commit ourselves, as the makers have never sent us one for inspection since it has been on the market. We could not advise you to go in for it from what we saw of it in its unfinished state. We hoped you may remain a subscriber for another four years and many more. Write us again if we can help you.

C. EMANUEL.—(1) We have sent to the makers and asked them to send on the camera, if possible with a "time shutter." We think you would find it difficult to adapt a "time shutter," but will report later on. Very pleased to note your name in the list of prize-winners in our "Prize Tour Competition."

W.—Certainly not worth buying.

ANATEUR.—Both books can be bought of our publishers. A marked list sent you by post.

X. Y. Z.—We advise in the following order: *f, e, c, d, g, h*. The cameras *a* and *b* we at present know nothing of.

J. R. BELL.—Extreme pressure and the holidays have prevented our giving the matter our attention. We will now do so, and advise you of the result.

TRY AGAIN.—The best advice we can give you is embraced by your *nom de plume*. You ought to have had no difficulty with the lens and plates you name. Certainly do not start with another lens, but persevere, and, above all things, see that shutter is in order, and that you don't start exposure without pulling the shutter of dark-slide, or drop the shutter with the cap on. You must have made some such blunder. There really is no reason why there should be "simply chaos." The lenses are both good ones; the second you name is first-class, and the plates are excellent. Let us hear again from you.

UMBRIA.—No. 1 lens is far away the best, and worth every penny asked for it. You might, perhaps, pick up a second-hand one of that make by advertising in Sale and Exchange column.

H. JONES.—Nos. 1 and 2 are both most excellent, if you require a cheaper lens we should recommend No. 4. The best cheap plate in the market is No. 1, the others we place in the following order, 5, 4, 3, 6, 2.

C. STEWART.—Send us a line and say to what price you will go, and we will try and help you out of the difficulty.

MELLING.—No. 2 and 3 are not reliable. No. 1: We would rather let you know a little later on; some excellent work is done with it. No. 4 is a well tried and reliable instrument. No. 5 is not equal to 6, but a really very fine lens. 7: We will certainly let you know.

FLANGE.—The QUARTERLY contains articles only written by the very best authorities upon photography, and matters relating to art and science. The REPORTER reports the proceedings at Societies' meetings, and contains much very useful matter. We are always pleased to hear of converts to stereoscopic work, and shall not rest satisfied until we have brought that very beautiful branch of photography to the front again. Mr. Valentine Blanchard will commence a series of articles upon "Stereoscopic Photography" in the first issue in May. A: We would rather not express an opinion upon this camera this week, but will refer to it, we hope, next week. B is a very handy and useful little camera, especially in obtaining negatives for lantern slides. C we have no knowledge of. D: We are waiting to see the "latest improvements," and, unless very marked, do not recommend it. E: A most useful and reliable instrument.

IVANHOE.—No. 1: A very fair photograph, definition good, view well placed on plate, quite free from any faults in technique. No. 2: A really charming picture, foliage well rendered, slight halation around the upper branches of the trees, perfect in technique and well composed, print a very excellent colour. No. 3: Foreground too heavy,

figures in mid distance out of place, the Glen would have been better for more sky and less foreground; lens has not covered plate in right-hand top corner, colour rather too deep. No. 4: A poorly composed picture, branches of trees, right and left, very glaring faults, no artistic value in the picture, the printing fairly good. As a whole the pictures are of fair average. You must need to study composition, your technical work is, generally speaking, good. Nature is not improved, as a rule, by the introduction of nineteenth century men and women, and few amateurs are able to introduce them without spoiling the beauties of nature. Eschew figures. Keep your foreground more limited, and remember that the sky always improves a picture, especially if the scene is thickly wooded. Finally, study "Picture Making by Photography" (Robinson), and don't be too ambitious. Take nature as you find her, and don't try and improve upon her.

NEIGE.—"The AMATEUR PHOTOGRAPHER Annual" will, you may depend upon it, be turned out in first-class style, and will, we trust, have the matter arranged upon some recognised system, adapting itself to the various stages of photographic manipulation. About the subject for the frontispiece it is a serious matter. One of the most prominent of the few virtues we possess is modesty, and we are afraid some might think, if we carried out your suggestion, that we had no further claim to even that virtue. Still, your kind words are much appreciated, and the suggestion shall have our best attention. We are afraid the perforating of sensitised paper would be attended with some difficulty, unless it were carried out prior to being sensitised.

TWIN.—Your photographs are many of them good. In No. 1 you have much too much foreground. No. 2: This interior is poor; the lighting is unequal. No. 3: Here again you have too much foreground, and you have not taken sufficient care in placing your view on the plate; note the left-hand corner. No. 4: A most excellent group, admirably arranged, and marvellously well lighted. No. 5: Same fault as Nos. 1 and 3, and every figure staring at the camera. No. 6: Very pretty grouping. The figures almost too large, but faultless as to composition and definition. No. 7: Not a good composition; your central subject is too much in the mid-distance, and the fault of extreme foreground is very apparent. No. 8: Well taken, and figures posed with some judgment. You would do well to take up genre and figure studies.

C. COUET COLE.—We are pleased to receive your kind letter acknowledging receipt of medal. We are happy in believing that the opinion you have formed of the AMATEUR PHOTOGRAPHER is held by many thousands of other photographers throughout the world. Are you going in for "Travelling Studentship"?

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or *we*, *do*, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, Jan. 4th, 1889, to April 4th, 1890, complete, 5s.; "Sun Artists," parts 1 and 2, 5s.; "The Camera," complete set, 3 volumes bound, remainder unbound, 12s. 6d.; PHOTOGRAPHIC SOCIETIES' REPORTER, complete set, 7s. 6d.; "Photographic Art

Journal," complete set, 1 volume bound, remainder unbound, 8s. 6d.; "American Annual of Photography," 1887 to 1890, 6s.; "Photographic Quarterly," parts 1 and 2, 1s. 9d.; all are clean and perfect.—Irwin, 66, Serpentine Avenue, Sandymount, Dublin.

Vols. viii., ix., and x. **AMATEUR PHOTOGRAPHER**, 8s. 6d. per vol.; twenty 6d. parts "Camera" magazine, 5s.; first sixteen 7d. parts Cassell's "Cathedrals, Abbeys, and Churches" (present edition), 6s. 6d.—T. O. Hosking, 35, Paulet Road, Camberwell.

Apparatus.—Lancaster's half Meritote, new condition, new mahogany stand, one wood, two Tylar's slides, adapter, 4s.; large changing bag, 7s.—Battell, 14, Queen's Road, Walthamstow.

Bicycle.—Safety, tangent wheels, and all 1890 improvements, cost £20, good as new; or exchange for first-class binocular microscope, or sale; carriage paid.—C., Ashfield House, Malta.

Burnisher.—Burnisher, half-plate (Rock, Sheffield), warranted; cost 30s.; take 8s.; giving up silver printing.—Crump, Common, Sutton, Surrey.

Burnisher and Lamp.—Tylar's half-plate burnisher, with lamp, good as new; 8s.—Walsh, 179, Walter Street, Blackburn.

Cameras, etc.—Half-plate mahogany camera, four dark-slides, home-made; exchange quarter Instantograph, with three slides; no approval.—Graham, New Lanark.

Half-plate box camera, two dark-slides, combination portrait lens, complete, perfect condition; 25s.—A. Lawton, Bank Top, Morley, near Leeds.

Instantograph camera, half-plate, this year's condition as new, latest pattern, with slide, quarter carrier, and mahogany folding tripod, is fitted with very fine rapid rectilinear lens, suitable for either views or portraits, Waterhouse stops; lot, complete, 75s.; approval.—Cooper, 9, Sussex Terrace, Markfield Road, Page Green.

Superior long-extension 5 by 4 camera, three slides, and case; a bargain, 52s. 6d.—Bell, 4, Milton Terrace, Belfast.

Quarter-plate Instantograph 1886, two double backs, all complete in canvas case, with stand; 30s.; or what offers?—G. W. Harrison, Rosendale Lodge, Streatham Hill.

Half-plate camera, three double slides, all best make (by Wood, London), four-fold stand, Optimus rectilinear lens, all new last month; cost £10; bargain, 28s.—61, Gayhurst Road, Hackney.

12 by 6 camera, best make, three double backs, all modern improvements, nearly new, very cheap.—Box 270, Post Office, Bradford.

Camera Case.—Camera case, Lancaster's waterproof, stiff leather bound, new, 11 by 6 by 11; 8s. 6d.; approval 6 stamps.—6, Albion Cottages, Avenue Road, Stamford Hill, N.

Changing Box.—Changing box, Shew's portable folding, whole-plate; 8s.—Miss Cox, 4, Strathearn Place, Edinburgh.

Dark Tent.—Portable dark-tent, pine, dovetailed, with legs, ruby lamp, etc., closes as a box, 30½ by 18

by 7½, in perfect order; 20s.—Irwin, 66, Serpentine Avenue, Sandymount, Dublin.

Detective Camera.—Beck's detective camera for sale, Newman's shutter, iris diaphragm, six double dark-slides, used four times only; cost over £11.—Cash offers to Constantine, Handsworth Wood, Birmingham.

Lantern, etc.—A binial limelight lantern, fitted with dissolving tap, safety blow-through jets, in perfect condition, only been used a dozen times, also oxygen gas cylinder, fitted with tap, etc.; the whole for £13; cost £18.—Address, Hal Keene, 494, Brixton Road, London.

Lenses.—Half-plate rapid rectilinear lens; 30s.; good bargain.—T. Taylor, Tannery, Marple.

Optimus rapid rectilinear 12 by 10 lens, cost £7, nearly new; will take 50s.—Address, Piggins, 95, Old Kent Road.

Dallmeyer's whole-plate R.R., £5, formerly property of most distinguished amateur; or exchange Optimus R. Euryscope, 9 by 7, and 10s.—W., Studio, Boston Road, Hanwell, W.

Half-plate rapid rectilinear, 9 in. focus, and instantaneous shutter; £2 2s. lowest.—Thompson, Brooklands, near Manchester.

Dallmeyer's whole-plate rectilinear landscape lens, fitted with Thornton-Pickard time shutter, both new; price £5 17s.—Graham, Chemist, Stockton-on-Tees.

Lens and Shutter.—Taylor's 10 by 8 single lens, iris, cost 73s., cash 52s., new; quarter-plate Phantom shutter, pneumatic, 7s. 6d.—Jenkins, Fern Bank, Gloucester.

Sets.—Lancaster's 1883 Instantograph, half-plate, landscape lens, iris diaphragm, shutter, two double and one single back and tripod, in good order; price 45s.—23, York Place, Leeds, Yorks.

1889 half-plate Instantograph, fitted, Wray's R.R. lense, pneumatic shutter, four double backs, good tripod, waterproof bag; cost 210s., best condition, offers.—R. Fortune, Harrogate.

Half-plate Optimus, square bellows, long-focus camera, and three slides, fitted in leather case, Ashford's tripod, all perfectly new, in perfect condition; offers wanted.—G., 18, Sandringham Road, Dalston.

Camera, 7½ by 5 (by G. Hare), with four double backs, Ross' whole-plate rapid symmetrical lens, Phantom shutter, and strong ash stand, the whole in splendid condition and latest improvements, price £10; also whole-plate burnisher, silver steel, 10s. 6d.—K., Thorndale, Werpole Road, Wimbledon.

Shutter.—Phantom shutter, with pneumatic release, fit any hood up to 2½ ins.; cost 27s., take 14s. 6d., approval.—F. Sharpe, Oakham.

Slides.—Six Tylar's half-plate slides and screen, four never used; 15s.—Spence, Winterfield, Higher Broughton.

Sundries.—Camunilux, combines half-plate camera, extending bellows, two double slides, magic lantern, and enlarging apparatus, lens, and stand;

exchange whole-plate lens, or offers.—Easterby, 10, Hope Street, West Hartlepool.

WANTED.

Cameras, etc.—Lancaster's quarter Instantograph camera, three double slides; also four-fold cyclist tripod, no lens.—Western, Ravensbourne, Shortlands.

A good 5 by 4 long-focus camera, with reversible frame and three double backs; also quarter ditto, and three double backs; cheap, for cash, no cards.—T. son, 12, Halcyon Road, Birkenhead.

Whole-plate camera, slides, tripod, burnisher, good maker; in exchange for whole-plate Dallmeyer R.R., cost £3.—Palmer, Solicitor, West Hartlepool.

Foraminifera.—Works on above subject by Carpenter, D'Orbigny, Parker, and others.—O., Ashfield House, Malta.

Hand-Cameras.—Facile, fitted rectilinear lens; accept same and £5 for high-class half-plate set, new.—Tucker, Herrick Road, Loughborough.

Loan, for three or four weeks, good quarter hand-camera, complete, with R.R. lens and latest improvements for plate changing and carrying, Artist or Facile preferred; every care will be taken. State full particulars.—Anglais, Mouleau, Archon, France.

Lantern.—Lantern, complete, and good half-plate lens. Will give Hillman's tricycle, worth £3.—Kennett, Sandgate, Kent.

Lenses.—Ross' rapid symmetrical lens, half-plate or larger, in good condition, cheap.—Address, Glazebrook, Melling, near Liverpool.

Half-plate rapid rectilinear lens, by good maker; approval.—Festus, Pounder, Enniscorthy, Ireland.

A good 8 by 5 rapid rectilinear lens.—Metcalfe, Rodly, near Leeds.

A good 8 by 5 R.R. lens.—J. Pearce, Ore, Hastings.

5 by 4 rapid rectilinear lens, Wray's much preferred, with or without shutter.—J. E. Graves, 11, Lansdowne Place, Blackheath.

18 by 18 rapid symmetrical lens, by Ross, Dallmeyer, or other good maker, must be in perfect condition; state all particulars and lowest cash price.—C., Hornby Villa, Hoylake, Birkenhead.

Microscope.—Good binocular, first-class maker.—State all particulars to O., Ashfield House, Malta.

Roll-Holder.—Morgan and Kidd's roll-holder, perfect condition.—Hawksley, 76, Roe Lane, Southport.

Sets.—Cheap quarter-plate camera, with slide, lens, and tripod.—Bertie Turner, Braintree.

Half-plate camera, slides, tripod, by first-class maker.—Jones, Old Vicarage, Chirk, Ruabon.

Slides.—Double dark slides for Lancaster's Instantograph half-plate.—J. Carr, 21, Market Place, Wakefield.

[PRICE TWOPENCE.]

✻ OUR VIEWS. ✻

To hold as 'twere the mirror up to nature."—*Shakespeare.*

WE have now the pleasure to state that the prints sent in to the last two Monthly Competitions have been judged, with the following result :

In Monthly Competition No. 10, "Landscape with Figure" :—

First Prize.—CECIL V. SHADBOLT, "At Carthagen, Spain."

Second Prize.—Lt.-Col. H. H. SEALY, "In the Silchester Woods."

Honourable Mention.—Alfred Stieglitz (Berlin), "Snowscape;" David R. Clark, "By the Esk River;" James Drew, "Gloucestershire Harvest Field."

Monthly Competition No. 11, "Genre or Figure Study" :—

First Prize.—G. F. ZIMMER, "Forty Winks."

Second Prize.—Mrs. MOUNSEY, "A Professor."

Honourable Mention.—J. O. Bury, "A Regimental Favourite;" J. J. Thornton, "Old Peggy;" C. C. Mackley (Germany), "The Amateur Photographer;" F. G. Smart, "Making a Net;" Miss Alice Henderson (Nice), "She Begs for Time to Reflect;" H. G. Brierley, "Getting to the Bottom of it."

We are pleased to see a decided improvement in the standard of work sent to the No. 11 Competition, and suppose that we have to thank the improved and more settled state of the weather. The bulk of the work contributed to No. 10 Competition is decidedly poor. Mr. Shadbolt's picture is a pleasing composition, and is exceedingly carefully arranged, and the technical work in every sense perfect. Lt.-Col. Sealy shows a boy with donkey and cart drawn up in the woods. Definition is sharp and bright. Mr. Stieglitz gives us a snow scene with group of villagers in friendly counsel. The print is on Obernetter paper, and is particularly soft in tone. Mr. David R. Clark sends a fine view on the river Esk, which is not, however, improved by the introduction of a figure.

Mr. James Drew, in his "Gloucestershire Harvest Field," gives us a pastoral which is rather formal, and in which one figure is slightly out of focus. We cannot compliment this competitor upon the colour he has secured.

As we have said, the work sent to the No. 11 Competition is of much better quality. Mr. Zimmer has contributed more than once to our competitions, and we most heartily congratulate him on having secured the First Prize in the "Genre or Figure Study" competition. His study "Forty Winks," is an admirable piece of lighting and composition. An old gentleman has fallen asleep over his book, and the light streams in from the window, falling softly upon his hands and face. Detail in the shadows is well rendered. In the print the blacks are very soft and velvety, and also show us what admirable half-tones may be secured by the platinotype process. Mrs. Mounsey sends us a magnificent study, "A Professor," taken with a Ross R.R. lens on an Ilford plate, developed with pyro and ammonia; the print is on Obernetter paper. It is hardly necessary to state that every detail is brought out; even in the deep shadows there is extreme brightness. The next in order is the contribution of Mr. J. O. Bury. The picture shows us a wee child riding pick-a-back on a soldier; the focussing of the child is rather faulty, and the printing is a little too deep. We are much pleased with the matt surface, which is produced by squeegeeing Aristotype paper on ground-glass. We notice Mr. Bury toned this print with chloro-platinite of potassium, and has secured a charming colour. Mr. J. J. Thornton's "Old Peggy" is a good study, but rather artificial in the posing. He uses a Rapid Symmetrical, Britannia plates, develops with hydroquinone, and prints on Aristotype paper, squeegeeing and drying the print on ground-glass, giving the effect of an ordinary silver print, but with considerably more detail. Mr. F. G. Smart sends us a photograph, "Making a Net," which has nothing much to commend it; the figure is stiff, and the background most uninteresting. The technical work is very careful; the photograph was taken on a Mawson plate with a Ross 10 by 8 lens. Miss Henderson's picture is fairly com-

posed, and tells the story of the title; the figures are rather stiff, and the third figure in the picture is amused with the performances of the operator. The picture was taken with a Voightlander's lens on a Marion's plate. Mr. Brierley's "Getting to the Bottom of It," shows a little girl drinking from a cup, with her dolly in attendance—a pretty little composition.

Mr. Charles L. Mackley's "The Amateur Photographer," is an amusing composition. The enthusiast has prevailed upon a long-suffering friend to sit "to be took." He has requisitioned the hall chair, a screen, old packing case, and hearth-rug, to form a studio; on the ground a table-cloth is spread to assist the lighting; on one side a child stands on a chair with an umbrella or an overhead light screen, and on the other side another child holds a white cloth to induce a side light. The operator is in the characteristic attitude of a working photographer; the whole is particularly droll. Apart from the merit of the composition, it is a very fairly executed photograph.

We shall hope, now that the outdoor season has commenced, that a very much larger number of photographs will be contributed. The next competition is for "Instantaneous Photographs, Animals, etc." All pictures for this competition must be received on or before the 14th of May. We are anxious to collect together as many pictures as possible for loaning during next winter season, and shall be quite prepared to increase our prize list if the photographs merit additional awards.

* * * *

On the occasion of the visit, on Saturday last, of representatives from the firm of Messrs. Hazell, Watson, and Viney, Ltd., to Aston Clinton, the seat of Cyril Flower, Esq., M.P., copies of the PHOTOGRAPHIC QUARTERLY and the AMATEUR PHOTOGRAPHER Prize Pictures were presented to the Right Hon. W. E. Gladstone, M.P. The right hon. gentleman, who received the party in the magnificent drawing-room, expressed himself as extremely delighted with the photographic results attained in these publications, and informed the company that they would form a part of his library at Hawarden. It is interesting, also, to record that the genial host on this occasion is an ardent amateur photographer. Mr. Cyril Flower kindly took no less than six photographs of the group of visitors, and, in the course of conversation, said that he considered the plates in the QUARTERLY were "simply exquisite."

* * * *

In reviewing the recently issued "Home Portraiture" number, the *Bookseller* says, "This work should be in the hands of every photographer, whether professional or amateur, as its examples will tend to impress upon them the paramount importance of careful grouping so that the general effect shall be lifelike, while all that is stiff and inanimate is avoided, a result too often wanting in photographs."

* * * *

WE are pleased to notice that a society has been started for the Staffordshire Potteries, with head-quarters at Burslem. There is every probability of the Society securing a considerable number of members.

* * * *

In another column will be found a letter suggesting the

formation of an Amateur Photographic Society at Cambridge. This will not in any way clash with the already existing Cambridge University Photographic Society, the members of which have done good service in advancing the science and art of photography.

* * * *

THE Croydon Camera Club is pushing ahead. The President, Mr. Maclean, is untiring in his efforts, and we understand that already some fifty members have been enrolled. It is hoped that the number will reach 100 by the commencement of the next winter season.

* * * *

TO-DAY (Friday) the International Photographic Exhibition will be opened at Newcastle-on-Tyne. We understand that the Exhibition is of a very extensive character. The following are amongst the exhibitors:—Messrs. Dudley Arnott, M. Auty, J. E. Austin, W. J. Anckorn, W. J. Bryne, E. Beck, Court Cole, A. R. Dresser, T. H. Faulks, W. Croake, D. Barnett, T. G. Whaite, H. S. Mendelssohn, Green Bros., H. P. Robinson, R. W. Robinson, G. Proud, B. G. Wilkinson, C. S. Roe, F. Howard; Pancoast, Bullock, Redfield, Dumont, U.S.A.; H. Little, Geddes and Sons, A. W. Gottlieb, H. J. Godbold, F. Whaley, W. H. Kitchin, W. W. Winter, J. P. Gibson, Rev. C. Hare, A. Keighley, A. F. Pinheiro, R. Keene, F. M. Sutcliffe, J. E. Goold, W. D. Welford, W. Parry, A. Chancellor, H. W. Reeves, E. Greaves, G. W. Wilson and Co., H. G. Ridgway, G. West and Son, J. Pike, Symonds and Co., Lyd. Sawyer, H. R. Procter, J. Lafayette, etc. The judges are to be Messrs. Paul Lange, William Lang, jun., F.C.S., and J. W. Wade, gentlemen well known and all practical photographers. The Exhibition is to be opened by the Mayor and Sheriffs of Newcastle. The Presidents and Vice-Presidents of the Newcastle-on-Tyne and Northern Counties Photographic Association will be present, and a large number of invited guests. At seven o'clock in the evening Mr. Paul Lange will give his lecture upon "Norway," of which the following is a synopsis:—*Newcastle-on-Tyne*: The Quayside. *Hardanger Fjord*: Bubrae Glacier, Sunday at Odde, Lotofos and Skjeggedal Waterfalls, Eide, Vosvangen, Naerodal, Gudvangen. *Sognefjord*: Essfjord, Balholmen, Suphelle Glacier, Borgund Church. *Nordfjord*: Faleide, Loensvand, Strynsvand, Bergen and Fish Market Scenes, Sunset. To-morrow (Saturday) there will be a vocal and instrumental concert at 3 p.m. and at 7.30 p.m. Monday, the 21st, Mr. W. Lang gives his lecture, "Fifty Years of Photography." On Wednesday, the 23rd, Mr. Welford gives a lantern show. On Friday, the 25th, the prize and other slides are shown. On the 2nd of May, Mr. J. P. Gibson will deliver a lecture, with lantern illustrations, entitled "Northumberland, its Antiquities and River Scenery;" and so on, throughout the time the Exhibition is opened, something will be going on as well as the Exhibition. We have said enough to recommend our readers who are able, to visit the Exhibition, which is certain to be a great success. The Executive have worked most assiduously, and the Hon. Secretaries, Messrs. Lee and Brown, are to be congratulated upon the attention and courtesy which they have shown to all comers. We shall, of course, have more to say about the Exhibition in next week's issue.

* * * *

A PRIZE-WINNER in our recent "Prize Tour Competi-

tion" writes, "I trust that the advancement in my studies for the next three years may be such as to place me, at the end of that time, second to none in the list of competitors, and I shall hope then to be able to carry off the highest honour that can be taken by an amateur, viz., the AMATEUR PHOTOGRAPHER Gold Medal."

* * * *

MR. W. COLLS has kindly sent us a copy of "Breezy Marshlands," with Dr. P. H. Emerson's compliments, which has been admirably photo-etched by him. The picture is extremely uninteresting. The centre of mid-distance is occupied by waggon and horses with attendant waggoner, all in natural proportion, but the boy and the gate at left hand of picture are very much out of proportion; the gate is much higher than it is wide, and the boy, if measured on the same scale as the waggon and horses, would be about 9 feet high. The effect of the distortion or unrealness of the picture is even more noticeable in the large expanse of foreground. We find that, taking the width of waggon to be 5 ft. 6 ins., the road, as portrayed by Dr. Emerson's lens, would not be less than 87 ft. from side to side—surely a most absurd distortion! The lanes in "Breezy Marshlands" are doubtless of an open character, but we cannot accept Dr. Emerson's picture in this case as being true either to nature or art.

* * * *

WE are glad to learn that a special meeting of the Photographic Trade Section of the London Chamber of Commerce was held on Monday last at its offices. Of the generous offer of the Drapers' Company, with regard to the loan of their hall, there was much approval expressed, and it was cordially accepted. It was also mentioned that electric light would be at the disposal of the exhibition for the evening. It was proposed to have 36 screens, which would provide space to the extent of about 3,750 square feet, and tables which would give another 800 square feet for the display of photographic appliances. The exhibition would be open, on presentation of visiting card, from ten to six. Already space to the extent of 2,000 square feet had been requested by intending exhibitors. We notice that the question of permitting amateurs to exhibit was again brought forward, but it was considered that, as the exhibition was to be held under the auspices of the Photographic Trade Section, it would be unwise to allow amateur to compete with professional photographers. The charge, it was thought, for exhibitors should be a *maximum* of 2s. per square foot. Mr. Cockin was proposed as Secretary, to whom communications should be addressed at Botolph House, Eastcheap. Mr. Bird consented to be the Treasurer. The exhibition will commence on May 30th, and close on June 10th.

* * * *

New societies keep cropping up in addition to those noted above. We have advice of one being formed at Bramley, near Leeds. The district comprised is considerable, and we believe largely populated. Particulars of the formation of the Society will be found in another column. Already some thirty members have been enrolled. A photographic society has also been formed in connection with the Mason's College. It is proposed to form a Society at Barrow-in-Furness. Mr. W. Dunlop, of 31, Hartington Street, Barrow, will be pleased to hear from ladies or gentlemen who may be desirous of assisting in the forma-

tion of such a Society. At Faversham, a correspondent, Mr. Charles J. Evers, of Albion House, writes us that there is a little band of workers eager to start a Society, but with some diffidence he says, "The great drawback is we have no teacher or leader here, and are all in rather a benighted condition." Perhaps some of our readers will communicate with Mr. Evers, and endeavour to throw a bright beam of light upon their darkness.

* * * *

WE publish two letters upon the Edinburgh Photographic Society. Mr. John Pirie is quite ready to throw his energies into the formation of a purely amateur photographer's society, whilst Mr. Murray suggests reforms in the management of the parent society. Perhaps the Council of the Society will deign to notice the matter. We are not sufficiently "in the know" to pass an opinion upon the inner working of the Edinburgh Photographic Society, but so far as the work done in public, judging from the published reports, we must admit that for so important a society, and for one having the largest muster-roll of any society in the kingdom, except the Camera Club, the verdict must be "Found wanting." We hope this matter will not be allowed to drop. Edinburgh and the immediate district around it is a perfect paradise for amateur photographers, and is visited by workers from all parts of the world. If a club is started it should be of a very first-class character, and should especially exert itself to help, with information, the hundreds of visiting photographers to the beautiful city of Edinburgh. Surely amongst the thousands of readers of the AMATEUR PHOTOGRAPHER, many of whom live "north of the Border," there can be no difficulty in securing first-class men of position, socially and as amateur photographers, who will lend their names and influence to establish a camera club in Edinburgh.

* * * *

THE ROYAL SOCIETY OF BRITISH ARTISTS.

THE sixty-seventh Exhibition of the Royal Society of British Artists has now, at the beginning of the Gallery season, opened its doors to the public. The members of the Society advance along the traditional lines (which is, indeed, to be expected of a Society which was founded many years ago), and it is only amongst the comparatively new members that there is any attempt at originality—No. 294, for instance.

The collection of close on six hundred pictures now being exhibited is rich chiefly in landscape and seascape, and one is specially struck by the large number of fishing-boat scenes. Mr. Hardy is conspicuous for his sea pieces. No. 84 is a very truthful rendering of a dull day with the rain-laden clouds hanging over the sea. No. 120 is a breezy bit, and the grouping of the vessels is instructive. No. 184 is a charming little sea-shore sketch. Of other seascapes, No. 11 is pretty, the red-tiled cottages breaking the sky line with their irregular outline. Mr. Cobbett's tiny Venetian sketches, Nos. 51, 85, and 114, are worth looking at; and Nora Davison, in No. 105, has succeeded in producing a picture with a peculiar attraction quite its own; there has been no attempt to include too much in the angle of view, no striving after effect, and the painting of the water in the foreground, with the warm colours of the masts and sails of the fishing boat reflected on its rippling

surface, is admirable. Mr. Priestmain's 259 is worth noticing for the cloud effect reflected on the water—it is hardly truthful though very beautiful. Nos. 289 and 501 are, again, good fishing-boat scenes; but coming to Mr. Reid's "When the Boats Come in" (No. 314), and looking at the extraordinary colouring, the photographer can congratulate himself that it is impossible for him so to libel nature. So, too, No. 31—a view of house roofs—is the sort of subject a photographer would only take to test a plate on, and the question arises whether the fact of its being produced by brush and paint is sufficient to admit it into the ranks of productions called "artistic." No. 12 is a pretty little water-colour by Elizabeth Petrie, and the visitor should not fail to see Nos. 43 and 67, both views of Dordrecht, by different artists; all three of these pictures quite attain to one's ideal of composition. Mr. Stannard, in No. 38, "A Note on the Ouse," shows a beautiful melody in soft greens and greys, with, fortunately, none of those disconnected tree branches interpolated to produce a conventional balance, as one so often sees. No. 108, "When Summer Flowers are Flown," is a charming piece of tree painting, delightful autumnal tints with a beautifully painted hazy background. But the palm for landscape must be given to Mr. Rouse, for No. 375, "The Close of Day;" he is evidently a disciple of Leader's, and to say that he has caught some of his master's spirit is to say that his work is successful. Mr. Jay's autumnal woodland scene, No. 395, is good, and Mr. Nelson Dawson's sketches are always worth looking at.

The next class for which this collection is distinguished is that which deals with architectural subjects, and the photographer can gain a good many ideas from one or two of the pictures, as to the artistic treatment of interiors, in the rendering of which the members of the Society are far more successful than when they attempt exteriors. No. 22, "The Interior of St. Bartholomew's, Smithfield," by Mr. Harding Smith, is well treated, and there is a good effect of sun streaming through the windows into the dark recesses of the Norman aisle. It is difficult to believe that No. 79 is by the same artist; it represents a bit of the cloisters of St. Antonio, Padua, but the artist does not seem to have the least realised how to treat a subject which has great possibilities; he has included a much wider angle and a far larger expanse of courtyard than the eye could have possibly taken in at one time, whilst he has most unnecessarily cut off the summit of the spire, which might have helped to balance the composition. There is an apparent distortion about the picture such as would be found in a photograph of such a subject taken either with an unsuitable lens, or unintelligently with a suitable one.

The two best architectural subjects are Nos. 46 and 264, both interiors by Mr. Bayliss, who appears to have a marvellous facility for this sort of work. The latter, though perhaps a trifle confused, is specially attractive; the rendering of the marble pillars is very fine, and the painting of the rose window on the left most effective. If there are pictures from which we can learn much, the treatment of No. 128 convinces the photographer that he has something to teach, at least, some few of the votaries of the brush, for none of us who have the least idea of artistic effect would dream of taking a straight-lined subject like the Temple at Paestum, "end on," with an equal piece of flat ground on each side.

Nos. 107 and 205 are street scenes in Dinan, by Mr. Pitt. There is not much to find fault with the angle at which the subject is represented (as there is in No. 29), or with its arrangement, but the artist has entirely failed to convey even the least suggestion of anything approaching the characteristics of a French street scene, and so deficient are his pictures in this respect that anybody with taste would infinitely prefer to possess one of Canon Mann's beautiful photographic studies of the same town. After looking at these, let the visitor refresh himself with No. 218, "Town and Temple," by Mr. Lauder, with its admirable perspective and characteristically truthful expression of a London street scene.

In portraiture the Society does not shine. Mr. Hallyer is successful in his rendering of heads; he adopts a white background, and his careful and finished painting stands out well from it. Nos. 153, 155, 182, and 248 are all worth looking at. He is at his best in 182, an old fisherman in a red cap. Mr. Hallyer fails when he attempts ambitious pictures: nothing could be more disappointing than No. 429. No. 508 is clever and very natural. No. 333 is a good full-length portrait by Davidson Knowles; the pose is capital. Nos. 335 and 275, both entitled "Reverie," are distressing. Others worth looking at are Nos. 406, 408, and 571.

The figure subjects and dramatic pictures are superior to the portraits, but not up to the landscapes in merit. No. 16 is a really commendable piece of oriental colouring. No. 134, "Rival Games," by Gordon Browne, is first-rate; the expressions on the faces of those interrupted in their game of bowls is admirable—the grouping, too, is excellent.

In No. 294 we come to one of the best, as well as one of the most original pictures in the Exhibition. It is, moreover, by a new comer to the Society, Mr. Brangwyn. The fine grouping of the figures as they stand upon the quay, anxiously watching and discussing, as the good ship tries to make the harbour, through the evidently tempestuous weather, defies criticism, at any rate at the pen of a photographer. Mr. F. Coleman has two figure studies; No. 209, a soldier repairing his armour, is very natural; the man looks his part to perfection. The same cannot be said of No. 225, entitled "An Italian Peasant;" it ought to have been called "Artist's Model Dressed as an Italian Peasant."

The three girls in a boat, No. 391, by C. E. Marshall, are treated in a bold, original manner, and the attitudes are unstudied and graceful. There are two disciples of Alma Tadema. Their pictures are numbered 14, 297, and 504, by H. Jackson, and 359 and 368, by Mr. Lowcock. They both fail entirely to catch their master's spirit; the marble, the Greek drapery, the scattered flowers, and even the distant vista of the blue *Ægean* are all there, but it is "all paint;" there is none of "the soul of painting," and "at the touch of the plagiarist all the poetry has flown." No. 151 reminds one strongly of Mr. Gale's cottage scenes. No. 146 is striking, and No. 371, though in a curious style of painting, contains admirable grouping and a considerable amount of spirit.

What, then, do we learn from this Exhibition, with its many merits and defects? Surely, the truth of this saying of Mr. Ruskin's, that "painting, with all its technicalities, difficulties, and particular ends, is nothing but a noble and expressive language, invaluable as the vehicle of thought, but by itself nothing."

Letters to the Editor.

AMATEUR PHOTOGRAPHIC SOCIETY FOR EDINBURGH.

SIR,—It would be unfortunate if Mr. Pirie found no further support in the expression he has given to the undoubted feeling of disappointment and dissatisfaction with photographic affairs here.

I differ from him as to the necessity for a new Society, but I am entirely in accord with him as to the supineness and want of energy of the present Society and its office-bearers. The interest taken in its monthly meetings is far short of what it should be, its papers are not creditable, its demonstrations and discussions few and of little interest, and its management generally wanting in vigour.

It would do the Society little good to enter into a discussion here of its failings, which are only too evident to any one who attends its meetings, but I venture, as a loyal member of it, to make one or two suggestions for reform. I think only harm will be done by multiplying the photographic societies in Edinburgh. A large Society has necessarily, if well managed, greater possibilities than a small one, if only because of the greater support it can always command. For this reason I would deprecate the formation of any new Society. I have to suggest, however—

(1) That at least three-fourths of the Council of the Society should be amateurs.

(2) That it should have rooms belonging to itself, and occupied solely for its own purposes, open every day.

(3) That it should encourage the formation of sections interested in special kinds of work.

(4) That it should hold an annual exhibition, and arrange for minor ones throughout the year, as well as for excursions to places of interest.

I look to the change in the Executive, and to the acquisition of proper premises (a question it is now considering), as being the first essentials of making the Society as influential as it is now weak. But I am convinced that unless by the formation of its members into sections, and the encouragement of special work, or by some similar plan, it promotes friendly intercourse and mutual helpfulness, the size of the Society will always hinder instead of helping it. Apologising for the length of this letter, I am, etc.,

ALFRED R. MURRAY.

April 9th, 1890.

SIR,—My last communication would appear to have disposed of the gentleman who championed the existing Edinburgh Photographic Society in your columns. Living in this city, I learned the other day that a meeting of the leading members of the society was held to consider the attack which had been made upon them, and I looked for a letter from some of their number in defence of their claim to represent amateur photography in Edinburgh.

It is evident to everyone that they do not represent it, and their silence shows that they themselves are conscious of the fact. As your leaderette a fortnight ago stated, the society, once an active one, is now moribund.

Nothing could have so well illustrated your remarks as the impotence of the members to defend their position. The sooner a society is set agoing which will at least make an endeavour to keep abreast of the advancing cause of photography, the better. I consider that, even on a small scale, it would be advisable to begin at once, and will therefore be glad to hear from anyone who is favourable to my proposal, so that arrangements may be made for making a start, either at once or in autumn. I may say that I have already received valuable promises of support. My address is 6, Marchmont Road, Edinburgh.—Yours, etc.,

JOHN PIRIE.

CHEAP LENSES.

SIR,—In the PHOTOGRAPHIC SOCIETIES' REPORTER of March 31st, 1890, page 94, Mr. F. T. Norris is reported as saying "the Kodak and some other hand-cameras have no more expensive a lens than a single non-achromatic objective, costing, first cost, about 6d. each. Yet the work done by them is capable of very satisfactory enlargement." This must be news to most people, and the question is, if a sixpenny lens will do so much, why pay four or five pounds for one?—Yours truly,

FRED DAVIS.

HAND-CAMERAS AND STEREOSCOPIC WORK.

SIR,—As far as I am aware, no hand-camera fitted with a film holder has yet been placed upon the market adapted for stereoscopic work. A very perfect article for the use of plates has, however, more than once been shown by Mr. A. Stroh, a talented member of the Camera Club. Similarly, proceeding upon independent lines, I had constructed a hand-camera taking twelve $6\frac{1}{2}$ by $4\frac{1}{2}$ in. plates in double backs, fitted with the Wollaston diaphragmatic shutter, a pair of Dallmeyer's patent Stereograph lenses, working at an intensity of $f/4$, and provided with means for using them in their single form, thus giving, roughly, a choice of 5 or 10 in. focal length. This instrument has been productive of what is, I believe, generally admitted to be very excellent hand-camera work (some of which I shall be pleased to show your correspondent "Rb. Rb."), but, like all stereoscopic cameras capable of similar adaptability, it is somewhat bulky and heavy. The latter defect may be remedied by the substitution of films for glass; but the former must, I fear, prove a stumblingblock to the general employment of stereoscopic cameras for hand work. I fear your correspondent will have to commission some good firm to build an instrument to his special order; in this case, if "expense be no object," I can, I think, put him on the right tack.—Yours, etc.,

E. R. SHIPTON.

A NEW TONING BATH.

SIR,—As a constant reader of the AMATEUR PHOTOGRAPHER, and particularly those columns devoted to "Queries" and "Answers" I have often been struck with the number of amateurs wishing to be enlightened as to the best method of obtaining rich purple black tones in silver printing by means of one of the numerous gold toning baths in general use.

After a careful and interesting series of experiments with the above object in view, I have decided on the following formulae as being both simple and thoroughly effective for either matt-surface or albumenised papers:

I.

Bi-carbonate of soda	6 grs.
Gold chloride	1 gr.
Ammonia '888	4 minims.
Water (up to)	8 ozs.

Wash the prints in two changes of water, and then transfer to a dish containing:

II.

Bi-carbonate of soda	1 oz.
Water (tap)	10 ozs.

Toning may be commenced after they have been in the latter solution about three minutes.

Fix in the following for fifteen minutes:

III.

Hypo-sulphite of soda	2 ozs.
Ammonia, '880	2 minims.
Water (up to)	10 ozs.

Again place the prints in bath No. II. without previous washing for about three minutes; then dilute the bath and finish washing with ordinary water.

Trusting that these few remarks may prove of interest, I remain, yours faithfully,

C. J. DAVIES.

MOUNTING PRINTS.

SIR,—There is one method of simplifying the somewhat tedious process of mounting prints, and that is by using the rather ingenious inventions of Messrs. Fell and Co., of Wolverhampton.

I am always on the look out for really useful novelties, and so I was pleased to come across these three helps for mounting prints. No. 1 consists of a very neat brass cylinder, with piston, of small but convenient size, closed at one end with double fine wire gauze. The starch is put in this cylinder, and the piston inserted and forced down; this causes the starch to be pressed out, and having passed through the wire gauze, it is in beautifully smooth condition for mounting prints.

The second item is a little roller, with which the starch is smeared, and this serves capitally for large prints, and its use is more expeditious than an ordinary brush.

The third item is a useful brass roller; this is employed after the prints are placed on the mount. I put a piece of clean stiff paper over them, and roll them down freely. The method is

speedy and clean, and the appearance of the print greatly improved. Some of my friends have thought that such prints had been burnished, as the rolling gives such a nice surface.

I trust that many others may find valuable assistance from these useful and not expensive helps in mounting prints.—I am, Sir, yours faithfully,

C. HETHTON LEWIS.

* * * *

ALPHA PLATES.

SIR,—In common justice to the Britannia Works Company, will you permit me to say that I have used several dozens of their Alpha lantern plates, and did not find a single soiled or defective plate in the lot? But then I carefully unwrap the plates, and ascertain the coated side by touching a corner with a pin or a penknife, taking care never to touch the surface with a finger. I never used such sure plates before, and generally have twelve pictures from a dozen plates.—Yours, etc.,

W. J. CHRISTIE.

* * * *

PHOTOGRAPHIC SOCIETY FOR THE POTTERIES.

SIR,—Will you kindly allow me space to answer Messrs. Powell and Hewitt on the above subject. They seem to think I am opposed to any other society being formed about here, which is not the case, as I should like to see several if there are sufficient amateur photographers to keep them afloat, which I very much doubted when I last wrote. Let me only say I (as Secretary) will do my utmost to help Messrs. Powell and Hewitt should they think fit to ask me.—Yours faithfully,

W. WILBERFORCE BEACH

(Hon. Sec., Newcastle A. P. S.)

* * * *

AMATEUR PHOTOGRAPHIC SOCIETY FOR CAMBRIDGE.

SIR,—It is desired by several interested in the art of photography to start an amateurs' society in this town, and if you would kindly give the subject publicity through your columns it would be doing much towards drawing attention to the subject of the numbers in the neighbourhood who are interested in the art.

Those wishing to aid in the formation of the society please to communicate to Mr. F. H. Sanderson as early as possible, so that arrangements may be made in order to start the above proposed society.—Yours, etc.,

W. HARRON.

* * * *

YELLOW V. RED GLASS.

SIR,—Seeing "Experience's" letter in the AMATEUR PHOTOGRAPHER of April 11th, I wish to ask why the canary-coloured glass is not used instead of the red ruby. After using the collodion wet, five-and-thirty years ago, I had to give up, and have now taken to the dry plate a month or two ago, and had many failures from too much light through the ruby, which was not dense enough. Why have calico if the yellow glass will do? Surely glass is better than calico.—Faithfully yours,

CALICO.

"LIPPINCOTT'S" for April contains an interesting story by Christian Reid, "A Cast for Fortune," a continuation of Nathaniel Hawthorne's "Elixir of Life," and other attractive articles, including "On Some Recent Art Progress," "Stanley's Emin Pasha Expedition," and "The Spirituality of Marriage."

THE ANNUAL DINNER of the employés of Messrs. William Watson and Sons, of 313, High Holborn, took place at the Holborn Town Hall on Saturday, April 12th. Mr. T. P. Watson occupied the chair, and Messrs. Worster and Sanders the vice-chairs. After dinner, and the loyal and patriotic toasts had been duly honoured, the Chairman proposed those of the various departments and workshops, which were responded to by the managers. During the evening a capital programme of songs, recitations, etc., betokening the presence of considerable musical and elocutionary ability, was gone through, and at 11 o'clock the whole company, about 120 in number, joined hands and sang "Auld Lang Syne," separating in time to get home before Sunday morning, after having spent a most enjoyable and pleasant evening.

The Complete Photographer ;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

BY H. P. ROBINSON.

CHAPTER VIII.

Development.

PUPIL.—I suppose, now we are going to develop, I shall begin to learn some of the secrets of success. Or, possibly, I shall not be deemed worthy of attaining the grand arcanum until I have gone further into the mysteries. Without wanting to seem ungrateful, I hope I may be allowed to say that up to now I have heard nothing new or different to what can be gathered from the shilling hand-books.

PHOTOGRAPHER.—The secret of success in photographic manipulation is that same "gathering." There is no unpublished secret in photography, except the open secret of photogravure. I have heard of an amateur—but I don't know how true it is—giving £100 for a few lessons in this process, but perhaps that sum included the retention of the teacher as a photographic "ghost" to do the work for him; and the other day a mine gave several guineas to a process-monger for a certain so-called secret. Against all experience and probability, it was worth the money to him, but it was not new. It had been published dozens of times. It is proverbially difficult to find the needle in the pottle of hay. It is finding the needle and using it properly that is success. I am showing you the way to find it. I am trying to put you on the clue that threads the maze; you may lose yourself in the by-ways of the photographic labyrinth when I have done with you, if you like. I take the liberty of reiterating that my object is to teach you what to select and avoid, rather than anything new. There is too much of what flattery would call new; so much is this the case, that there is danger of losing the best processes in the obscurity of multitude. Our present subject—development—is as good an illustration as we could have of the difficulty in finding the needle. Suppose you found in the books "A Thousand and One Ways of Cooking Eikonogen," or "Studies in Beach's Developer," or "Variations in Pyro," or "Reminiscences of Oxalate," or "Hints on Hydroquinone;" the magnetic current would probably be lost before it got to the needle, and there would be no success, whatever that word may mean. Success itself is a needle in difficulties; we are always hunting for it and never finding it. Yet onemore illustration of the legend of the Boojum—we vanish when we see it. We have not time to moralise, so let us get back to our work, and see if we can rescue you from this crowd of developers. It has been said that much of the prevailing insanity among photographers may be traced to new developers and their numerous progeny, the modifications, ably assisted by the large family of gay and festive instantaneous shutters that are always ready for any mischief.

PUPIL.—Is this a fairy tale?

PHOTOGRAPHER.—How gentle your hints are! Now, to be serious. You want to know the best developer out of the thousands. It is not easy to reply with precise accuracy. Doctors disagree, and in half-a-dozen articles on the same developer we get six varying opinions. Where there is no fixed data, conclusions must differ. I can therefore only give you what in my experience I find to be the best in average circumstances. The function of a good developer is to bring out the latent image impressed on the plate, so that the light and shade of nature shall be best imitated or interpreted in the finished picture. In doing this, modern

requirements demand that it shall be energetic, so that the shortest exposure may be given; that it shall not fog or stain the film; that it shall not take an unconscionable time to do its work; that it shall allow some latitude in exposure; and that it shall not be decomposed by a reasonable length of keeping.

PUPIL.—Can all these qualities be found in one developer?

PHOTOGRAPHER.—Nearly, and, curiously, this combination of good qualities is to be found in the oldest. I have used pyro and ammonia from the beginning, and although I have tried nearly every new developer that had any claim to common sense in its constitution, I have not found any other to equal it as an all-round developer fitted for the use of the picture maker. Other developers may have their special qualities and uses; some may be a little quicker, others may be—well, I cannot see any other advantages in the rest of them, except you want to produce a particular colour of image, as in lantern slides, which, however, is not our business at present. There will be no objection to your trying some of them after you have perfected yourself in the simple course I am trying to take you through. The developer I use, and never, except experimentally, depart from, is made as follows; I will set it down in the simple old-fashioned manner, and say nothing of the metric system or the intolerable facility of 10 per cent. solutions, or any other of the ingenious suggestions for going a long way round to do a simple thing.

Bottle A.—Pyrogallie acid	..	..	1 oz.
Citric acid	..	..	40 grs.
Water	..	..	7½ ozs.
Bottle B.—Bromide of potassium	..	120 grs.	
Water	..	..	7 ozs.
Ammonia 880	..	..	1 oz.

It would also be as well for use on emergency to have at hand a bottle of solution of bromide of potassium as follows:—

Bottle C.—Bromide of potassium	..	80 grs.
Water	..	8 ozs.

It is sometimes the practice to have the ammonia solution in a separate bottle, but this has little practical advantage to compensate for the additional complication.

I have found that if the pyro part of the developer is made with water that has been boiled and allowed to get cold, it maintains its discoloured condition for a much longer time, and although the solution remains efficient after it becomes brown, it is weaker and imparts a darker stain to the gelatine film than when it is less coloured.

PUPIL.—What effect has boiling on the water?

PHOTOGRAPHER.—Boiling expels the air which is always found in water which has been exposed to the influence of the atmosphere for any length of time. The oxygen dissolved from the air unites with the pyrogallie acid, forming the dark brown discolouration of which I was telling you just now.

For use, these solutions must be diluted, the normal proportion being—

Water	..	..	..	3 ozs.
A	..	..	..	60 minims.
B	..	..	..	60 minims.

But these proportions are subject to much alteration, for one of the merits of this developer is the great possibility of variation to suit different subjects and exposures. It may be taken as a general rule that pyrogallie acid gives intensity, ammonia detail, and that bromide restrains, keeps the shadows free from fog, and gives time for the operator to watch the course of development, but there are qualifications for these statements which I shall point out and show you

practically by and by. For instance, pyrogallie acid will only do its work when excited to do so by an alkali, and the addition of more pyro to the formula I have given would cause little, if any, increase of density, and the addition of ammonia towards the end of development will materially increase density without adding much to detail, although if added in excess it may produce fog; and it is a curious fact, never noticed that I am aware of, that a plain solution of pyrogallie acid used alone is a desensitiser. This use of the word is not strictly correct, because it is too late to say a plate is desensitised after it is exposed, but what I mean is this. Take two plates exposed alike, or, what would be better, divide an exposed plate into two parts; soak one in pyro for ten minutes, and then develop the pair in one dish, and it will be found that the half treated with pyro solution has less detail and appears to have had less exposure than the other. I mention this as it is a practice with some photographers to place their plates first in plain pyro under the mistaken notion that it will be easier to apply the developer when active with the addition of ammonia. I should also mention that the citric acid is used only as a preservative of the pyro, and is neutralised when the ammonia is added.

The Electric Light and Photography.—I.

By T. C. HEPWORTH, F.C.S.

INTRODUCTORY.

It was originally my intention to include a consideration of the important subject which heads this article in my "Winter Work" series. But the matter was crowded out for want of space until the general heading which I had adopted for my series of articles became from lapse of time a misnomer, so that, with our Editor's permission, I have abandoned my old title, and have started afresh with a subject which I cannot but think will be of interest to most amateur photographers. The electric light, after many a vain effort to bring itself into prominence, has at last come within the domain of things practical, and in a short time we may hope to have it laid on to our houses much in the same way that gas has been supplied to us for so many years. It behoves us therefore to direct attention to the coming change, and to point out how far the new lamps when exchanged for old ones will possibly cause modifications and improvements in our daily work. It may also be desirable to indicate by what means and how far it is practicable for an amateur to use the electric light independently of any supply from outside his own premises. A brief review of what has been done in the past to gradually bring the electric light to its present perfection will be necessary as a prelude to my remarks.

The first experimental production of the electric light was due to Mr., afterwards Sir Humphrey, Davy, at the beginning of this century. At that time only a simple form of electric battery, founded on Volta's pile, was known, but sufficient interest was taken in the mysterious kind of power which it exhibited to induce "a few zealous cultivators and patrons of science," as Sir Humphrey called them, to subscribe towards the construction of a powerful combination of battery cells, which, although capable of intensely brilliant results for a short time, would be stigmatised in these days as cumbrous and imperfect to the last degree. This huge battery consisted of no fewer than two thousand plates of metal—contained in porcelain cells—and exhibiting a total surface of 128,000 square inches. To the terminals of this battery were fastened copper wires,

and it was when these wires, furnished with charcoal points, were brought together that the most brilliant effects were produced. Here is part of Sir Humphrey's description of the experiment: "More than half the volume of the charcoal became ignited to whiteness, and, by withdrawing the points from each other, a constant discharge took place through the heated air in a space equal at least to four inches; producing a most brilliant ascending *arch* of light, broad and conical in form in the middle. When any substance was introduced into this arch, it instantly became ignited. Platinum melted as readily in it as wax in the flame of a common candle; quartz, the sapphire, magnesia, lime, all entered into fusion; fragments of diamond, and points of charcoal and plumbago, rapidly disappeared, and seemed to evaporate in it, *even when the connection was made in a receiver exhausted by the air-pump.*"

In the above quotation there are two points which should be particularly noted, and which I have italicised. The first is the word *arch*. In Davy's experiment the two charcoal points, or rods of carbon, were held horizontally, and after being allowed to touch were separated by some inches while the so-called *arch* played between them. The arched form was doubtless due to ascending currents of air caused by the great heat, and the phenomenon is interesting as pointing to the origin of the word *arc*-light, which is still in common use to denote that species of electric regulator where two carbon rods are used as terminals.

The other point which I have underlined is important in indicating that the electric light is different from ordinary combustion in being quite independent of any oxygen supply. We read that when the carbon rods were placed under the exhausted receiver of an air pump, the carbon rods glowed with even greater brilliance. In the present day the little pear-shaped glow lamps, which are now becoming so common for interior illumination, depend for their efficiency on the circumstance that the delicate filaments within them can shed its radiance independently of any air supply. Indeed, these little globes are exhausted of air to the greatest possible extent, and only under such conditions will they continue to be serviceable.

From Davy's time up to within recent years many attempts have been made to bring the electric light into competition with the older illuminants, but as long as it was dependent upon the current from any form of primary battery, all rivalry, on account of the excessive cost of electricity under such conditions, was quite out of the question. For occasional experimental use the electric light was seen now and then, and sufficient interest in it was kept up to induce inventors to produce various forms of lamps, or regulators, as they are called. These regulators act simply as supports for the two carbon pencils between which the arc light is produced, and, although they present much variety in details of construction, they have a great family resemblance. In all of them certain conditions have to be complied with, under which only can the arc light be produced. It is essential in the first place that the carbon pencils should actually touch. Directly the current passes they must spring apart for a certain distance, and between them appears the brilliant arc, which is in reality part of the current still playing between the separated carbons. Should the light be from any cause extinguished, the carbons must again come together and be separated before it can be re-established. These automatic movements of the carbon holders upon the regulators are generally brought about by the ingenious use of electro-magnets, which are controlled by the same current which furnishes energy for the light. Some regulators, and especially those of more recent introduction, are far better than others, and it must be evident to the most careless observers that the brilliant

lights now in occasional use act with far more steadiness than those of a few years back. But it is only right to say that this absence of flickering is in part due to the better form of carbon pencil now in use.

Common charcoal is much too soft a form of carbon to be of any practical use for electric lighting, although it served Davy for his experimental lamp. The pioneer workers with the light were quick to appreciate the need of something less fragile, and the recognised material for regulators came to be the harder parts of the coke found in gas retorts, which were sawn into square pencils of half-inch section. But coke is by no means a pure form of carbon, and is contaminated with certain earthy impurities, which, under the intense heat of the electric arc, would spit and sputter, and cause the light to have those irregularities in working which used to be so noticeable. When, therefore, a few years ago the electric system gave signs that at last it could compete with gas illumination, the attention of its advocates was at once turned to the improvement of the carbon pencils. The old method was discarded, and the pencils were manufactured by a process which ensured homogeneity and purity of material.

The process adopted at this time is still followed, but of course experience has induced modifications and improvements. The materials employed comprise lampblack, sugar, and other forms of carbon due to the decomposition of tar, resin, etc., which are intimately mixed, and formed into a paste with gum or other binding material. This paste is formed into sticks of various sizes in iron moulds, which are subsequently exposed to a red heat until all the materials used are thoroughly coked. The product is a perfectly smooth, close-grained, and hard cylindrical pencil, which gives a metallic ring when struck. These carbons are sometimes coated with copper so as to increase their conducting power. It will be understood that these pencils are used only for what is known as the *arc-light* system of electric illumination.

But the other method of producing light by means of electricity has long had an attraction for inventors, although it cannot claim such a pedigree as that already mentioned. The *incandescent* system dates from the year 1845, when E. A. King took out a patent for a lamp which was worked upon an entirely new system. Of recent years this specification of King's has been consulted by experts perhaps more than any other document in the Patent Office, and in truth it would seem to tread heavily on the heels of certain modern inventors. The incandescent system is based upon the fact that when a thin wire of metal or carbon is placed within the circuit of a suitable battery or other source of electricity, it offers such resistance to the current that heat is generated, and it becomes incandescent. When this incandescence is brought about in a vacuum, the light given out is much increased, and the material, protected from union with the oxygen in the atmosphere, does not so soon drop to pieces. In King's first lamp he used a ribbon of platinum foil between two electrodes, but in a later form he employed a stick of carbon in a glass receiver exhausted of air.

(To be continued.)

A SIMPLE PHOTOMETER.—A correspondent writes, "I think the simplest and most reliable photometer is an ordinary radiometer, which can have degrees marked on the glass for timing by the fans of the vane revolving, which is acted on only by the quantity or quality of light at the time of exposure. They can also be made watch form, to screw on to the camera, with a silvered reflector at the bottom to increase the speed if necessary. I think if such a thing were in the market, it would take well."

Hand-Cameras.

By "F. R. C. S."

I THINK that perhaps my experiences during a tour last year in Scotland with a hand-camera may be of practical use to some of your readers, and that I shall be able to answer some of the numerous questions which I see asked over and over again in your columns.

First about hand-cameras. I think that nine out of ten of those advertised are much too bulky to carry about; at any rate, if you have frequently to take walks of five or six miles or more over rough roads. All those which contain a dozen plates to be changed from the outside without opening the camera come under this head, except such as Rouch's and one of McKellen's, where the plates are changed by putting the arm through a sleeve. But why do we want a dozen plates in the camera with facilities for firing them all off in a given number of minutes, as if it was a Maxim gun with the enemy in sight? Surely the result can often be only a lot of careless pictures; and what objection can there possibly be to carrying a double slide or two in the pocket or in a sling-case? There is one very serious objection to all these cameras. When you are touring you must be prepared for anything—not only street scenes and near instantaneous views, which require a double short-focus lens, but also distant views of mountains and lakes, which, to get in perfection, must be taken with a single-view lens, and also with slower plates than are used for the instantaneous pictures. Here the above cameras are completely at fault. The single lens requiring a longer focus cannot be used, or (except in one or two cameras) cannot be changed for another lens, and the plates that you have in must all be gone through in rotation. Most of these cameras, again, do not admit of focussing a view on a ground-glass, another serious fault. If it were not for these last two defects, McKellen's camera, where a sleeve is used for changing, is a very portable model; the 5 by 4 size being only about half the size of most of the quarter-plate cameras. Many cameras, again, are made one-third bigger than they need be, on account of the tube of the Newman's shutter with which they are fitted; and, if I am not mistaken, all those containing a dozen plates are double the depth that they might be if fitted for movable dark-slides instead.

If near instantaneous pictures are the only object of the photographer, I should say that one of the larger Kodaks, with celluloid film on roller, is nearly perfection; but the great objection to it is that you must go through the whole length of film—sixty to one hundred exposures—before you can develop one of them. I am aware, of course, that, at the expense of a great deal of trouble and considerable risk, the film can be cut and fixed again. However, for my part, if I could not use a single view lens on the camera as well as the rapid double lens, I should not care to carry a camera at all. Certainly, during a five months' trip through Scotland last year, I used my single lens six times to once that I used the double.

The details of a hand-camera I think as nearly as possible perfect, are as follows: It should be, first, large enough to take in a compactly-made quarter-plate dark slide, such as Turnbull's. It should be arranged with a sliding body, that when closed would give a focus for a $4\frac{1}{2}$ or 5 in. lens, and should work out by a focussing screw underneath, so as to give a length of focus of about 7 or $7\frac{1}{2}$ ins. for the single lens. The focussing glass when not in use slides into a groove in the door which closes the back of the box. There is a door also in front by which the lens can be got at, and the shutter can be set. The shutter which I have to my camera is Caldwell's. The camera, as far as relates to the size and position of the doors, is much the same as one made by Turnbull, of Edinburgh, but has, in addition, the sliding body and a different focussing arrangement. It has also a finder showing the actual extent of view on the plate at the time. This camera is about half the size of any of those which contain their dozen plates, but is quite as large as most people will care to carry for any distance. Dark-slides can be packed inside when travelling, but when looking out for views, it is much better to carry them in cases made out of black cloth or velvet, in the pocket, or slung in a light case over the shoulder. As to the tripod stand, which I would never be without, there is one made by Mr. Smith, of the Sciopticon Company, which beats all others. It consists of three very light legs of pine, it serves as a walking staff, and is wonderfully firm and strong, far more so than any

of those which fold up into three or four, and it is about one-tenth of the trouble to put up.

Now a few words about developing plates when travelling. The year before last I exposed some dozens of plates when travelling, and sent about three-fourths of them to London to be developed by the makers of the plates. I think one plate out of about a dozen turned out well. The rest of my exposures I took to one or two photographers in towns that I happened to pass through, and saw them developed myself; most of these turned out well. This last year I developed all my plates on the spot; that is within a day or two after exposure. Now I see a good deal in the AMATEUR PHOTOGRAPHER about dark-rooms at various places where amateurs may change or develop plates, and I also see frequent questions about all sorts of very inconvenient changing-bags, and I cannot help thinking that a most delightful little arrangement for changing or developing which I got from Fallowfield has been entirely overlooked by amateurs. It is a small tent, which when packed up looks like an ordinary drawing portfolio. They are kept, I think, of two sizes, 18 ins. by 12 ins., and 24 ins. by 18 ins. I had mine made 20 ins. by 13 ins.; it is about 2 ins. in thickness, cloth and all, when shut up. An illustrated advertisement may be seen in Fallowfield's list. It packs easily in a portmanteau, and consists merely of two pieces of mill-board or light wood, which open out like a book, and are fixed at a right angle by wires. A black cloth is attached round the edges, and when the tent is placed on a table, you can sit down before it, and the cloth is drawn down over the head and arms, and tied round the waist, leaving the arms thus perfectly free to work, and as the cloth extends a foot or so on each side of the portfolio, there is plenty of room. The front part of the portfolio has a red-glass window in it, and there is a ventilator at top. When using this I place the necessary trays, etc., as follows:—On the right is the ordinary bedroom toilet bottle of water; on the left is a deep tray for washing; in the middle the developing tray, opposite the window; on right of window two bottles of developer. I may say here that I always use H. Lewis's developer in two solutions, and find it perfect. In left-hand corner is a small glass, half full of water; in this I place, before and after using, a brush for developing. Lastly, opposite the window is a glass measure, called by some who are fond of inventing new names a "graduate."—in the case of a lady, I suppose, "a sweet girl graduate." I have a light brown paper cover to go over the developing tray, and after developing I wash the plate—or, rather, film, which I always use—two or three times by pouring water over it in the developing dish, and emptying same into large tray on left. I then put the cover over the negative in the developing dish, open the tent, and take out the dish with the film in it to the darker part of the room, away from the light, and put it into the hypo. On the right side of the tent there is plenty of room for the dark-slide or for a box of plates. When I have removed the exposed negative from the slide, and have put it into the dish, I generally put the slide into the bag or fold of the cloth which it forms in front below the table, thus getting it out of the way. In this bag also I keep a cloth to wipe the fingers if necessary. From the form of the cloth of this tent, and the ample space left for the elbows, there is, after getting accustomed to it, no sense of confinement, and I find it so comfortable and convenient that I do all my development in it, even when at home. It could be used perfectly with much larger plates than the quarter, and it is taken out of your portmanteau and put up in less than a minute.

The films I used last year were Carbutt's for instantaneous pictures, and Fry's, of the second degree of rapidity, for views with time exposures. These last I found very good indeed. Carbutt's were sometimes spotty. By the by, can any reader of the AMATEUR PHOTOGRAPHER say whether there are any good isochromatic films to be had, or is it likely that Mr. Edwards will either make some or let anyone else make them for sale?

It will be seen that to be in a position to take with a hand-camera good views as well as quick pictures, we must have, at any rate, two, if not three, kinds of films or plates, and that consequently they must be carried in dark slides. There must also be the possibility of changing the lens. By having the slides made of different coloured wood, or the shutters which draw out, some of mahogany and some of vulcanite, there need be no fear of confusion. In travelling it is of great consequence to reduce the impedimenta as much as possible. I take no chemicals beyond the two bottles of H. Lewis's developer and some hypo, and the films require no alum. Before starting on a tour, take.

the films out of the paper envelopes in which they are sold, get some well-made flat tin boxes one-sixteenth inch each way bigger than the films, and about one inch deep, lay a piece of yellow paper across each way as lining for the box, with ends to turn over, and pack your films in with tissue paper between each. This will save all the trouble of unfolding four or five different papers to get at the films, which is a great nuisance in a small dark tent. The tin boxes should have outer cases of brown paper or millboard.

The "American Amateur Photographer."

DR. P. H. EMERSON'S ENGLISH LETTER.

WE are pleased to notice from perusal of the January number of the *American Amateur Photographer*, that from the able pen of Mr. D. Harbord the following letter has been received and published:—

"Dr. Emerson's letter on the exhibition of photographs at Pall Mall is unlikely to disturb or interest American readers. It is equally certain that the exhibitors themselves can afford to be amused or indifferent, as the worthy doctor is well known to be absurdly extreme in his ideas of art, and very unscrupulous in his criticisms as formed through his remarkably solitary pair of spectacles. I myself am one of those unpretentious or grossly incompetent votaries of photography who have practised the art since the infancy of collodion, and yet have never exhibited a picture, good, bad, or indifferent, and the more I see of the judgment of *quasi* artists the more thankful I am never to have had a grievance against the Drs. Emerson of the hour.

"What particularly amuses me is the way in which certain amateurs are propping each other up, who, in my hearing, have in times passed smiled in pity upon one another. I particularly remember one of those scathing, scalpel-like criticisms, in which the doctor excels, of one of his own great (?) 'naturalistic' pictures which people were afraid of not believing in, for the Doctor was *the* man then. I allude to an awful abortion representing a man ploughing up-hill with a pair of horses. The man's foot was as long as the horse's head, and the whole picture so gloriously 'naturalistic,' i.e., 'fuzzy' or 'focussed with judgment,' that it was denounced as an imposture. Another nondescript represented two women in a fog, apparently looking for something they had lost: not an iota of detail; all left to the fervid imagination of the 'naturalist.'

"And yet 'focussing with judgment' found a very reverse effect in a decapitated head of an old salt. Every wrinkle, line, and spot was depicted as sharp as lens could make it.

"Occasionally the Doctor has won the hearts of admirers over some lovely photographs such as 'Gathering Water-lilies,' but he is never free from adverse criticism; his boasted 'subjects' are often inappropriate, as witness the woman 'gathering,' who suggests the wash-tub.

"The name of an advanced student of the anti-focus or 'fuzzy' school is descanted upon, but I have a lively recollection of that turncoat showing me work, the sharp focussing of which was his pride and delight. One thing is very patent in the Doctor's letter: he is more bent on vituperation—*vide* his rage at Robinson's masterly work—than on reformatory criticism, and his airs of superior judgment, to which he is solitary witness, deprive him of any hope of being valued at his own estimate.

"Anything more silly than his laudation of Mr. Davidson's pinhole pictures could hardly be conceived. They simply show what can be done with nothing, and how very undesirable the attempt is. The Doctor's pedantic desire to 'educate the great outside public' to his views of what photographs should be, will never be realised by such asperity as he indulged in by his denunciation of 'spurious effects,' 'meretricious clouds,' etc. His only chance lies in a practical demonstration of what art is, and I, for one of the many, fail to appreciate it in nine out of ten of his pictures, nor to realise it from his writings."

PHOTOGRAPHIC CONVENTION OF THE UNITED KINGDOM: LENS STANDARD COMMITTEE.—Opticians, and all interested, are invited to a meeting to be held at the Mona Hotel, Henrietta Street, Covent Garden, on the 25th April, at 7 p.m., to discuss the desirability of adopting and further defining "the lens standards" of the Photographic Society of Great Britain.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

ON Thursday, April 10th, there was an exhibition of lantern-slides, eight or nine members contributing towards the show. Mr. Gambier Bolton exhibited a new set of animal slides, Mr. Elder some Dutch scenery, Mr. Ferrero landscape work, and Messrs. Grimshaw, Howson, Robertson, and Noel-Cox pictures of various kinds. A very interesting set of arctic subjects, lent by Messrs. Fry, were also shown and described, and a variety of slides by the Woodbury process. During the evening, proofs of his recent pictures "The Haysel," and "Breezy Marshland," presented by Dr. Emerson to the Club, were exhibited.

On Thursday, April 24th, there will be a discussion upon Mr. Dallmeyer's paper read at the Conference, the subject being "The Treatment of Subjects by Focus."

Our Contemporaries at Home and Abroad.

THE *Journal of the Society of Arts* gives the following, in a paper read by Mr. W. J. Linton: "Colour alone (I mean mere light and shadow) can also represent form, but if that colour has to be got by lines, the law of line comes in absolutely. I do not mean to depreciate the value of tone or of delicacy where wanted. I only contend against exclusive attention to colour and tone, and insist that when you must use lines those lines shall have meaning. An engraving in wood is producible only by lines, and you cannot by any excess of fineness get rid of the lines. Is it not well, therefore, that what must be seen should be good, or say, at least agreeable? Is it not clear that as all your work is done in lines, the more these lines express or indicate, the more complete and satisfactory will be your work? Shall they not, even by their direction, rather explain or help to explain the shape or substance you have to represent with them, than distort or hide it? In the photographic imitations in the *Century* and *Harper*, and elsewhere, all thought of the values of line is abandoned. Whatever the value of colour, of tone, of fineness, does that necessitate an absolute disuse of line? Dis-use, for in the cuts I condemn line is not used, it is only put up with, its real use is avoided. It may be that this is wilful. There may be engravers who prefer to have no differential intelligence in their lines. I would still ask them to care a little for some pleasantness of beauty, confessing, however, that I have not much hope of beauty without intelligence."

The *American Journal of Photography* (Philadelphia), in an article on "The Metric System," says, "But further, the metric system is used by the whole civilised world, except English-speakers, and among the latter is used by all chemists. It is actually in universal use by chemists throughout the world. This is a good reason why all arts dependent on chemistry should use it, such as photography, medicine, and pharmacy. And it modifies the personal equation, because most English chemists think in grams. Another change that seems to me greatly needed in the mode of stating photographic formulæ is to give the strength actually used, and not that of the stock-bottle. Every man with brains enough to be a photographer at all, can make his stocks of a degree of concentration to suit his convenience, or the size of his bottles. Articles: "Photography in Criminal Jurisprudence," "A Seasonable Suggestion," "Some Possibilities of the Continuous Film," "Enlargements," "Emulsions," "Toning and Fixing," "Amateur Experiences," etc.

The *Naturalist's Record* contains good reproductions of "The Gate of Honour, Caius College, Cambridge," "Mount Pilatus overlooking Lucerne," and "The Lake of Lucerne." Articles: "Chats about Things Around us," "North American Birds' Nests and Eggs," "Jersey and Guernsey," "My First View of the Alps," "Some Notes on Migration," "Photographic Competitions," etc.

The *American Lithographer and Printer* (New York) says, "Very pretty effects may be produced by printing on ordinary albumen paper sensitized with the following solution:

Citrate of iron and ammonia	...	...	3½ drms.
Dissolved in water	...	...	2 ozs.
Red prussiate of potash	...	...	2½ drms
Dissolved in water	...	...	2 ozs.

Mix equal parts just before using, as the mixed solution will not keep, and float the paper as on the silver bath, film down, for half a minute or so, and suspend by one corner in a dark room to dry. Detail can be brought out almost equal to silver prints, while the ease of working and the cheapness make it quite desirable. The prints can be mounted and burnished. Do not try to keep the paper sensitized, but make up fresh when wanted." Articles: "A New Photo-Lithographic Transfer Paper," "A Photographic Stone-Etching Process," "Improved Photo-Printing Plate Process," etc.

The *Camera* contains articles on "Photographic Chemicals," "Exposure," "An Automatic Portrait Machine," "Crystal Palace Exhibition," "The Art of Photography," "Proposed Institute of Photography," and also two fair Meisenbach reproductions, one of the Forth Bridge, and the other of a gipsy dancer.

The *Photographic Times* (New York) says, "Mr. Gayton A. Douglass, of Chicago, sends the following hydrochinon formula, which he says is being largely employed by the Chicago Camera Club. 'It is recommended for negatives, lantern slides, and bromide prints,' he writes, 'the formula being that of James Colgrove, a member of the Chicago Camera Club.'

No. 1.

Hydrochinon	..	..	..	} each 90 grs.
Eikonogen	..	..	..	
Meta-bisulphite potassium	..	..	..	

Add water to make 16 ounces.

No. 2.

Carbonate of potassium	..	..	} each 1 oz.	
Carbonate of soda, crystals	..	..		..
Yellow prussiate of potassium	..	..		..

Add water to make 16 ounces.

To use, take:

Water	..	..	..	..	..	1 oz.
No. 1	..	..	..	..	..	1 oz.
No. 2	..	..	..	..	..	1 drm.

Or as needed." Articles: "Photographing Interiors," "Filtering Gelatine Emulsion," "Helps in the Studio," "Slow versus Rapid Plates," "A Copyrighted Shadow," etc.

Photography, in an article on "Mounting," says, "No more suitable resting-place can be found for a photograph, be it a platinotype or silver print, than a good Bristol board, by which term mounting boards which do not pass through any water-proofing or enamelling process are known; their principal objection is that they are easily soiled, and as many people cannot take up a photograph without leaving their thumb mark on it, Bristol boards cannot be recommended if the photograph is likely to be much handled, but what is known as enamelled or waterproofed board is preferable. The quality of these can be tested in the same way as Bristol boards, and it is also advisable to test them further by soaking a piece of one in water for some hours, when their bad qualities, if they have any, will be developed, and the water in which the piece is soaked can be tested for hypo. Highly smelling mounts, or mounts that seem to contain more plaster than fibre, should be avoided. The former will be the speedy death of any silver print, and the latter will cause much trouble by the edges of the mounts breaking away, and getting between the photograph and mount." Articles: "On the Copying of Photographic Prints," "A Table of Photographic Exposures," "Fine Art and Industrial Art," "Photographing Natural Colours," etc.

Wilson's Photographic Magazine (New York), in an article on "Preparations," says, "A ten-candle-power electric glow-lamp was, therefore, last month easily told off for service into the tall photo tent, its glass bulb 'frosted' to diffuse somewhat the very intense light of the carbon filament, and then enclosed into two coloured glass bells of much larger size, one red, the other green, furnished by a great photographic company in London, to render the otherwise beautifully white electric light incapable of acting on the most sensitive photo plate, even through a long development, and yet to retain a large amount of visible illuminating power for the eye. But what was the effect obtained? Nothing like it! The plates did not, indeed, blacken under the developer before the doubly colour-belled lamp so rapidly as they had done before a white one; but in one minute or two minutes of exposure, and at thirty inches distance, with hydrochinone develop-

ment, the impression became nearly coal-black!" Articles: "The Evolution of Photo-Engraving," "Landscape Work in Newfoundland," "A New Photogravure Process," "Art," "Photographic Freaks," "Emulsions," "Choice and View in Landscape Photography," "Photographic Entertainments," etc.

The *American Amateur Photographer* (Brunswick, Me.), in an article on "Prints on Plain Paper," says, "We can recommend the following formula as well suited for toning plain prints, having used it for some time with satisfactory results. It keeps well, improves with age, and is a good bath for fine work with mat paper:

GOLD STOCK SOLUTION.

Chloride of Gold	..	..	..	..	15 grs.
Water	..	..	..	..	7½ ozs

Two drams of this solution, neutralised with a pinch of chalk, are added to ten ounces of boiling water, and filtered into a quart bottle in which two drams of acetate of soda have been placed. When the soda is dissolved, the solution is made up to twenty ounces. The bath should be allowed to stand for some hours before it is used. The prints are well washed before toning, and great care must be taken to avoid over-toning. At the same time the prints must be thoroughly toned, as weak tones will disappoint the worker. A safe rule is to tone to a rich lilac, just verging on blue, for dark tones, and not so deeply for sepia. The after operations of fixing and washing do not differ from the usual procedure. When the printing has been very deep, as it must be for black tones, it is well to add fifteen or twenty grains of salt to the bath, to produce a bleaching action on the whites." Articles: "Rambles through the Rangeley's," "The Record of a Ramble" (illustrated), "A Vacation Trip through Canada," "Photography from a Woman's Standpoint," "The 'Eiko' Developer," "Flash-light Photography," "The Advantages of Photography to the Amateur," "Photography of the Least Refrangible Portion of the Solar Spectrum," etc.

The *British Journal of Photography*. Articles: "The Ultimate Effects of Hypo Eliminators," "Fading," "The Art of Retouching," "The Camera Club Conference," "Binocular Vision and the Stereoscope," etc.

The *Journal of Microscopy* contains articles on "The Parasitic Fungi of Insects," "Dips into my Aquarium," "On Certain Phenomena of Hypnotism," "On a Simple Tank Microscope," "The Pine Destroyer," "A New Staining Method," etc., and numerous plates.

The *St. Louis and Canadian Photographer* (St. Louis), says, "A simple and expeditious way of saving the silver contained in water from print washings is to place in a funnel a piece of cotton or filter paper, which has previously been saturated with strong salt water, and pour into the funnel your wash water containing silver; the chloride will all be caught on the filter, and nothing but clear water will pass through, which can be at once thrown away. If you have more washings than your funnel will hold, pour it into some unused bottle, tray or dish until your funnel is empty, then pass the remainder through. Your chloride is in much better condition to take care of, also for the refiner to handle, and you will save more silver. Some muslin cloth sewed to a hoop, the size of a pail, jar or cask, in a manner to allow considerable of the muslin to hang down funnel shape, will answer the purpose of holding the filter paper to catch the silver, remembering, that the filter paper must be soaked in salt water." Articles: "Is there a Blister Season?" "A New Eye," "The Old versus the New," "Stereoscopic Photography," "Among the Masters," "Incidents in my Experience," "What I Know about Printing," "School of Photography," "A Machine Camera," etc.

The *Photographic News*, in an article on "Aluminium in Photographic Apparatus," says, "The dream of half a generation ago of the advent of the time in which aluminium should be used, not alone for lens mounts and the screws of cameras, but for the cameras themselves, now seems likely to be realised within a moderate period, for aluminium has been steadily falling in price, and at the present time can be bought, of good quality, at fifteen shillings a pound, and of superfine quality at twenty shillings a pound. Worse qualities can be had at eleven and thirteen shillings per pound. The lower the quality of the metal the more brittle it is, and the more likely to be attacked by various chemical reagents. There are rumours in commercial circles that aluminium before long will fall in price to about six

shillings a pound, but whether there is any substantial foundation for the report we do not know." Articles: "On the Sensitising and Conservation of Albumenised Paper," "Photography in Natural Colours," "The Art of Drawing and Photography," "Photographic Groups," "The Latent Image," etc.

The *Photographische Rundschau* contains articles on "The Spectroscope and Photography," "Flashlight Apparatus," "Detective Cameras," etc., and the frontispiece is a photogravure of a view in the Prentin Wood, Cheshire, taken by Mr. Paul Lange.

L'Amateur Photographe (Paris) gives the following: "Albumen prints are washed in the ordinary manner, and then placed in a weak bath of acetate of soda and gold. Toning is allowed to proceed until warm tones are obtained. Then wash the prints in plenty of water and place them in a second toning bath, which is also a fixing bath, made up as follows:

Hyposulphite of soda, 10 per cent. sol. . . . 500 grs.
Powdered acetate of lead 1 gr.

The prints should remain in the bath about ten minutes, when they will rapidly take a good black tone." Articles: "Photography and its Industrial Applications," "Aerial Photography," "Repairing Broken Negatives," "Development by Eikonogen," "Reproduction in Black and White," "Practical Photography for Amateurs," etc.

The Photographic Society of Philadelphia is to be congratulated on its well-filled and useful library, a catalogue of which has just come to hand.

Science Notes.

MESSRS. THACKER AND Co., of London and Calcutta, have just published a valuable work on the "Grasses of the Southern Punjab," by Mr. Coldstream. It is illustrated by thirty-eight plates done by photo-lithography; and the reproductions are so good that the botanist who reviews the book in last week's *Nature* is able to correct the naming of several of the species from an examination of the plates alone.

In the Bournemouth Industrial and Loan Exhibition, which was opened on April 7th, Mr. Jones exhibits a series of specimens illustrating the various stages in the production of a photograph. This is a happy idea in the direction of educating the public, and might be copied with advantage elsewhere.

On March 31st, M. J. Fogh presented to the Paris Academy of Sciences a memoir on the action of hyposulphite of soda on silver salts, in which he dealt chiefly with the amount of heat disengaged during the chemical reactions which took place.

Drs. Brodhun and Lummer, of Berlin, are engaged in the attempt to construct an electric lamp which shall serve as a standard of light. They have already obtained a glow-lamp which, when fed by accumulators, does not vary more than 1 per cent. during 200 hours.

Professor A. S. Herschel has been studying the spectrum of sub-chloride of copper, and he writes (*Nature*, April 3rd), "There is much in these resemblances which betokens some kind of continuity of connection with the primary features of the chlorine spectrum itself; the evidences of which, although thus displayed by copper and chlorine in the spectroscope, may perhaps be sensibly regarded as having some near relation of analogy to the appearance of variable chemical combining power under the influence of light, between silver and chlorine, presented in photography; but there is also, undoubtedly, a very marked distinction between the "spectroscopic reactions" of these two different copper chlorides; and, similarly, there are in the apparently mutable photo-chemical affinity between silver and chlorine in photography, two fairly stable delimitations of its range in the "sub-chloride" (or, as it has been termed by Mr. Carey Lea, the "photo-chloride") of silver, and in ordinary silver-chloride. Further, discriminations of the copper-chloride spectra in intermediate forms, which they seem to comprise transitionally between the two definite ones of the chloride and the sub-chloride, would perhaps extend and strengthen this analogy, and may not impossibly help, at some future time, to explain and illustrate it, if there is any real soundness in it, more fully and completely."

Professor Raphael Meldola, F.R.S., is to lecture before the Royal Institution on Friday evening, May 16th, on "The Photo-

graphic Image." We look forward with considerable interest to the manner in which the lecturer will treat the contesting theories of Carey Lea ("photo-chloride") and Hodgkinson ("sub-chloride.")

A Photographic Society has been formed at the Mason College, Birmingham. Dr. Nicol (the inventor of the "Kallotype" printing process) is the President, and Messrs. Tuckwell and Pugh are the Secretaries.

The Lancet (April 12th) reports a case of death from poisoning by hydrochloric acid, one of the commonest chemicals used by the photographer. About one ounce of the strong acid was swallowed by mistake, and the patient (although at one time apparently restored to health) died three months afterwards from the corroding effect of the acid upon the coats of the stomach. The treatment (at the Charing-cross Hospital) consisted in the administration of a solution of carbonate of soda, with some milk and white of egg.

Mr. W. H. Symons has compiled, and Messrs. Gallenkamp and Co., London, have published a very complete series of well-gummed chemical laboratory labels.

The following notice has been issued by the Royal Geographical Society: "It would greatly add to the value of the collection of photographs which has been established in the Map Room if all the Fellows of the Society, who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they will be acknowledged. Should the donor have purchased the photographs it will be useful for reference if the name of the photographer and his address are given." Here we have the inception of a photographic survey of the world! The R.G.S. has also made arrangements by which Mr. John Thomson (author of "Photographic Illustrations of China and its People," etc.) will instruct intending travellers in the art of photography. The Society's Rooms are at 1, Savile Row, London; and the acting Secretary is Mr. H. W. Bates.

In the new volume of the Badminton Library, on "Golf," the illustrations which represent the phases of actual motion of the body, as in striking the ball, putting, etc., are all copied by artists from actual photographs. We cannot but feel, however, that it would have been far more satisfactory to have had the photographs themselves reproduced by collotype, for example.

There is one decidedly comic illustration (p. 214), entitled "Keep your Eye on the Camera," in which the golfers posing to be photographed cut a very amusing figure.

Mr. Edward Hailstone, of Walton Hall, Yorkshire, who died recently, will be remembered for his fine work, in two volumes, on "Yorkshire Worthies," which he illustrated with 200 photographs, from pictures exhibited at the National Exhibition of Works of Art, held at Leeds in 1868.

I strongly advise every purchaser of a hand or detective camera to test it before purchase, and see if it is *light-tight*. Remove the back of the camera, cover the head and the camera with an opaque cloth, and point the instrument to the sky. Allow the eyes time to become accustomed to the darkness; the least glow of light then visible should condemn the instrument. I write as a sufferer.

F. G. S.

OAKSHOTT'S "SALE AND EXCHANGE ADVERTISER."—During the last few months Messrs. Oakshott, of Falmouth, have showed considerable energy in providing for the wants of the amateur photographer and naturalist. Their latest venture is a sale and exchange advertiser, issued upon somewhat novel plans, which may be of service to some of our readers in the West of England.

PORTFOLIO CLUB.—Mr. E. J. Hughes, of 3, Colville Gardens, Bayswater, writes us that he has a few vacancies in his Portfolio Club for amateur photographers, both ladies and gentlemen. The rules are as follows:—(1) The Club to consist of not more than twenty-six members. (2) The subscription to be 2s. per annum. (3) Two portfolios to be sent round every month. (4) One print, by any process, to be inserted in the portfolio every month. (5) The portfolio to be retained two days. (6) Each member to criticise the prints. (7) Particulars as to exposure, developer, etc., to be given with each print contributed. (8) Members wishing to resign to give one month's notice. (9) When members receive the portfolio every month, they are expected to give notice of its safe arrival, by post-card, to the Hon. Secretary. These rules are subject to any alterations which the majority of the members agree to.

Apparatus.

MR. WILLIAM TYLAR, 57, High Street, Aston, Birmingham, has sent us another novelty—a plate and print washer. The illustration shows the washer being filled, and automatically being emptied.

Really the operation is simplicity itself. Of course it is best that the washer stand in a sink. The weight of the water coming upon the shallower end tilts the washer and releases the water.

The idea is ingenious, and adds another mark to Mr. Tylar, who has introduced so many excellent aids to photography. The apparatus may be seen at our offices.

* * * *

A NEW CAMERA.

The new camera (Colonel C. O. Ellison, Liverpool) is attracting some lively interest. The new instrument is perhaps best designated "The Combination," being so constructed and arranged as to be used either as a hand-camera or fixed on a tripod in the ordinary way. It is 9 by 8½ ins. by 7½ ins. over all, and when fully charged with twelve 5 by 4 ins. plates in six double-backs weighs about 10½ lbs., the object sought being to have a camera for any kind of work self-contained and complete in itself. This obviates the necessity of a travelling case or loose fittings. The "combination" frame or box is covered externally with leather. Inside it is fitted with an Optimus Eury-scope lens, interchangeable with a Dallmeyer wide-angle for interiors. Both are mounted on a sliding frame, which can be drawn out in the front and allow of the use of a single lens for long-focus work, a Kershaw shutter being attached for time or instantaneous exposures. The focussing is on an entirely new principle, the glass screen being moved by a sliding arrangement on each side of the camera, with screw and graduated scale; this enables the operator to focus at once to any required distance, and getting all the effects of a swing-back frame, the subject being seen "right side up," and without the use of the black cloth. Also by the adoption of the new focussing arrangement (recently patented by Colonel Ellison) the apparatus is workable while the camera is held for snap shots or fixed on the tripod, the latter being constructed on the ball-and-socket principle. The reversible back is dispensed with, the bottom of the camera being hinged and allowing of the turning over of the instrument by the withdrawal of a catch; thus vertical or horizontal pictures can be taken at will. The tripod head, it may be added, is of hard wood, giving all the advantages of the

metal ball-and-socket arrangement hitherto used, but without the great weight. When folded, the legs are only 20 ins. long. It is anticipated that the "Combination" only requires to be known to ensure its adoption by a great many amateurs.

* * * *

THE "GIAH" NEW AUTOMATIC HAND-CAMERA.

We have, through the courtesy of Messrs. Mawson and Swan, of Newcastle-on-Tyne, and 33, Soho Square, London, had an opportunity of examining the Giah camera. The mechanical movements of this camera are carefully worked out. It is fitted for twelve plates, which require no backing, and are brought into position in the exposing chamber by means of a rotary slide. The plates are stored in a chamber *over* the lens, and by a slight "tip" and one turn of a lever are brought into position for exposure; by another turn of the lever and a slight "tip" the plate is placed, after exposure in a chamber, *under* the lens. By an ingenious mechanical contrivance—in fact, a stop or block—it is impossible to rotate the exposing chamber until the plate has entered it from the store chamber, nor can the exposure chamber rotate except to discharge the exposed plate. The working parts of the apparatus are made with mathematical precision, all the brass work being made to gauge up to 1,000th of an inch. Each camera is fitted with a first-class lens and ingenious shutter. It is in every sense a detective camera, being small and very compact. The whole of the working parts are made of metal, and for foreign travel, especially in the tropics, we shall, after having thoroughly examined the apparatus, pronounce it most serviceable. It is made in two sizes, lantern plate and quarter-plate.

Notes from the Liverpool Centre.

(From our District Editor.)

LATEST advices from the Lancaster Photographic Society show that the society is in a flourishing condition. A busy and prosperous session is confidently looked for by the executive, the members being attentive and energetic. At the general annual meeting of the society held last week, Mr. J. W. Prickard in the chair, eight new members were elected: Messrs. H. L. Storey, C. Ford, H. J. J. Thompson, R. F. Housman, R. Tomlinson, H. Gilbert, Dickinson, and Sudell. The officers for the ensuing year are: President, Mr. H. L. Storey; Vice-Presidents, Mr. Jos. Parkinson and Mr. J. W. Prickard; Hon. Sec., Mr. W. Briggs; Hon. Treasurer, Mr. A. R. D. MacDonald; Committee, Messrs. H. A. D. Jowett, S. Fawcett, D. Bone, and W. C. Roper.

A number of alterations have been made in the society's rules, and the last Tuesday in the month has been fixed for future monthly meetings.

"One of the Crowd" writes to the *Liverpool Review*, a leading weekly paper here, severely rapping the local Libraries and Arts Committee for not treating the promoters of the Liverpool Photographic (1891) Exhibition more generously in the matter of the scheme. The Committee in question advanced the rent of the Walker Art Gallery rooms, where the exhibition is to be held, £5 a week. Local feeling is distinctly in favour of the promoters of the exhibition. The "conditions" attaching to exhibits for the forthcoming Liverpool show, submitted in the AMATEUR PHOTOGRAPHER of last week, have yet to be confirmed by the Council of the Liverpool Association.

Art and Pleasure Combined.—There was a muster of twenty members at the picnic to Rabymere last Saturday, organised by the Liverpool Society. Some excellent studies of the pretty, rustic scenery in the neighbourhood of the Mere were taken, the weather on the whole being fine and genial. The "out," however, was not allowed to pass without some fun, which, since Saturday, has been all the theme. Rabymere is some two or three miles from the nearest railway station (Bromborough), and on the return journey Mr. T. Mayne, Hon. Sec., ensconced himself and his "traps" on a forlorn black charger boasting a lady's side-saddle. The distinguished Vice-President, Mr. Tomkinson, and the not less distinguished member of Council, Mr. J. L. Mackarell, clambered on to donkeys. The trio had the utmost difficulty in keeping their steeds from occasionally lying down under the hedges on the roadside. Happily, however, they struggled through to Bromborough without serious accident, and

were forthwith dubbed "Bill Adams and his body guard"—the immortal Bill who, with slight help from the Iron Duke, defeated "Bony" at Waterloo, and saved Europe.

Optical Lantern Evening.—This is nearly midnight, Tuesday, and I have just got home from the City Hall, Eberle-street, where an excellent entertainment has been given, thanks to the Liverpool and Birkenhead Associations. Upwards of 400 ladies and gentlemen were present, each one of the audience evidently enjoying the instructive and interesting fare provided. The first part of the evening, from 7.30 to 8.45, was devoted to a descriptive lecture, "The Hundred of Wirral," by Mr. John Hargraves; half an hour for refreshments followed, and then Mr. Fred Clibborn took us through "Normandy," the tours being got through soon after ten o'clock. It was originally intended to follow the "Hundred of Wirral" pictures with the "White Mountains," the new Boston (U.S.A.) set, but these not having come to hand, "Normandy" was substituted, and, to speak the feeling of the audience, the Boston set would have had to be superlatively good to rank with Mr. George Thompson's exquisite collection. Mr. Hargraves and Mr. Clibborn both proved excellent lecturers, and—noteworthy coincidence—both rattled away in delightful Mark Twain fashion, as refreshing as it was pleasing.

Mr. Hargraves explained that the 160 or 170 slides embraced in the "Hundred of Wirral" collection were the best of 400 originally taken by some thirty-one members of the Birkenhead Society, which Society was the first to introduce the photo-historic survey now extensively followed by photographic organisations. His introduction was largely geographical, historical, and ecclesiastical; wonderfully comprehensive and largely instructive, ranging from the time of King Alfred. Taken all round, the slides were very high class and came in for frequent loud applause.

Mr. Clibborn explained that the "Normandy" pictures were from negatives taken by Mr. George Thompson, during a holiday tour last August. The many pictures were much admired, most of the really superb effects, perhaps, being interiors of old cathedrals, found in the numerous ancient and picturesque towns of Normandy. The humorous and felicitous remarks of Mr. Clibborn, who had accompanied Mr. Thompson on the tour, added much to the interest of this show.

The slides were shown on the Liverpool Society's own 16 in. by 8 in. screen, through an Archer oxy-hydrogen biunial lantern. Mr. Paul Lange filled the office of Chairman, the worthy President and Mr. Mayne (Hon. Secretary) being most assiduous in their efforts to make all comfortable.

Exhibitions.

BELFAST Y.M.C.A. CAMERA CLUB EXHIBITION.

THERE were nineteen classes, the first eight being for members only, the other eleven being open to amateurs. Two gold, ten silver, and seven bronze medals, a fine enlarging lantern, and opal enlargement were offered for competition.

Class 1 (Junior; those who started photography in 1889; six pictures, any subject).—The bronze medal offered in this competition goes to Mr. T. F. Bell for six aristotype prints, mainly views taken near Dublin.

Class 2A.—Mr. T. F. Bell again wins the bronze medal in this class for six Obernetter prints, principally cattle scenes and Lagan views.

Class 2B.—Dr. Stanley B. Coates, the President of the Club, shows four Blanchard prints, framed separately in black reeded frames. "Ess-na-Crub," the principal waterfall of Glenariff (the new tourist district of Antrim, now opened by the narrow-gauge line), and the "Mountain Farm," are his best prints. He takes the silver medal for these and two other Antrim views. He also sends in a set of aristotype prints from the same negatives, which show plainly that a good, vigorous negative is not so suitable for his process as a thin, rather fully-exposed one. The bronze medal goes to Mr. D. B. Scott for four pretty aristotype prints of the Cave Hill and some Lagan scenes.

Class 3 (Portraits).—Mr. G. H. Hamilton, the energetic Secretary of the Club, obtained the silver medal in this class. He sends three frames of groups and single figures, his best being the smallest print of the set—a pretty child with one knee on a chair.

Class 4 (Animals).—Mr. Bell is again successful in this class,

taking the bronze medal offered, for a set of lions, tigers, and zebra, taken at the Dublin Zoological Gardens.

Class 5 (Work done on Club Excursions).—Mr. H. McCleery takes the silver medal for four Blanchard prints, the best being his view of Ess-na-Larach, the most troublesome and dangerous of all the Glenariff Falls to photograph. Mr. Hamilton secures the bronze medal for a set taken on the Glenariff and Lagan excursions.

Class 6 (Lantern Slides; to become the property of the Club).—The Club become the owners of seventy nice slides by this competition, a very fair start, the valuable lantern offered going to Mr. D. C. Beggs, for a set of ten miscellaneous; Mr. Hamilton receiving the second prize for a similar number, the best of which are, a portrait of a lady, and a group of narcissus, a Blanchard print of this latter being the best of the two floral studies for which he secures the medal in Class 7—Floral.

Class 8 (Opalines).—The silver medal offered for the best two opalines was awarded to Dr. Coates, who sends six, two of which are mounted on plush backs.

Class 9 (White Frost and Sheere Church). The two prints sent by Mr. A. R. Dresser gain him the gold medal.

Class 10 (Enlargements).—W. H. Kitchin well deserves the silver medal for his "Village Smithy" (which also takes the gold medal for the "best picture in the Exhibition," Class XV.). He also secures the bronze medal for a glen scene. Mr. A. R. Dresser sends the boat towing behind a steamer, but much less touched up than the print which he sent to the Ulster Amateur Photographic Exhibition last year, and the merits of which were much debated on, owing to its having taken a prize there. This enlargement is the best and most suitably mounted of Mr. Dresser's exhibits. Mr. Swanston sends two enlargements from quarter-plate films of scenes in Norway. Messrs. Kitchin, Strain, and McCleery also exhibited. This class had the largest number of entries, there being sixteen frames sent in.

Class 11 (Instantaneous).—The judges did not consider the merits of the exhibits in this class worthy of a medal, and withheld it.

Class 12 (Lantern Slides).—Mr. A. R. Dresser takes the silver medal for six very pretty slides, the best of which were a burst of spray and group of cattle.

Class 13 (Portraits).—No entries.

Class 14 (Architecture).—Prize withheld, owing to insufficient merit of exhibits which were average samples of work done by beginners.

Class 15.—See Class 10.

Class 16 (Best two Negatives).—Dr. Coates is successful in this class, taking the silver medal for a negative of Portaferry, with sunk schooner in foreground, taken from the jetty at Strangford, and one of Castleweller, Caster, seat of the Earl of Annesley.

Class 17 (Maine).—Bronze medal won by Dr. Coates for Blanchard prints, the two best of which are his Strangford and Portaferry views, one of the latter from the negative which secured the medal in Class 16; he also sends the same view printed by aristotype process.

Class 18 (Best picture on Ilford plate).—Both silver and bronze medal go in this case to Dr. Coates, for his "Summer Weather at the Copelands"—children wading about, while their mothers are enjoying a quiet chat on shore, and his view of the pretty little coast village Carnlough. The boats in this view make an effective foreground.

Class 19 (Best picture on Fry plate).—In competition for the opal enlargement offered by Messrs. S. Fry and Co., Mr. A. R. Dresser sends the picture of "A Child and Dog," which was reproduced by the AMATEUR PHOTOGRAPHER as a full-page supplement in the last "Home Portraiture" number. This picture has been much criticised, both in the exhibition and also when it first appeared in the AMATEUR PHOTOGRAPHER, the majority of critics agreeing that the large white sash mars the general appearance very much, the judges, however, awarded it the prize.

DUNDEE AND E. OF SCOTLAND PHOT. ASSOC.:—On the 8th inst. a general meeting was held, Mr. J. D. Cox in the chair. Excursions were arranged to take place on May 21st, the Trossachs; June 28th, Lochearnhead; and the date of a third was left open. The President (Dr. J. K. Tulloch) read a paper entitled "Selecting a Lens." Specimens of "Kallitype," a new printing process, were on exhibition, and a demonstration of the process was promised to be given at the May meeting.

Societies' Meetings.

NOTE.—In this column the Editor can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editor will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BIRKENHEAD PHOT: ASSO:—The ordinary monthly meeting of this association was held in the association rooms, Price Street, on Thursday, the 10th of April. The President, Mr. P. H. Phillips, drew the attention of the members to the forthcoming convention, to be held in Chester during the last week in June, giving a brief outline of the week's programme, and urging upon each one the desirability of availing himself of the opportunities such a convention afforded. Mr. W. B. Beaton (Messrs. J. J. Atkinson and Son) exhibited a cheap form of casket lens, capable of being used at a focus of 5, 7, or 9 inches. Mr. G. A. Carruthers exhibited a flash lamp constructed out of a clay pipe, with which he obtained a very powerful light. Mr. W. A. Brown then gave his paper on the "Chemistry of Photography," illustrating the same with experiments. The annual outdoor competition will take place at Bidston on Saturday, the 31st of May. The slides made by the members in connection with Mr. John Hargreaves' survey of the Hundred of Wirral were shown to the members of the Liverpool Association on the 14th inst.

BOLTON CAMERA CLUB.—This club held their first open meeting on the 11th inst. The room was quickly filled with invited visitors. Dr. Johnston, the President of the club, opened the proceedings with an address on the objects of the association, and expressed his pleasure at the rapid progress they had made. He strongly recommended the club to young amateurs as a good school for acquiring a knowledge of photography. An exhibition of prize slides, kindly lent to the meeting by the proprietors of *Photography*, was shown. During the evening, Mr. T. Parkinson, sen., presented each member of the society with an excellent permanent photograph of their President, and at the close of the gathering votes of thanks were passed to the various contributors for a very enjoyable evening. It may be added that Dr. Johnston forms the subject of illustration in this month's PHOTOGRAPHIC SOCIETIES' REPORTER, the photograph being the same as that presented to the members of the club.

BOLTON PHOT: SOC:—The monthly meeting of the Bolton Photographic Society was held at the Baths, Bridgeman Street, on Thursday night, April 3rd, Mr. Edmund Naish Ashworth in the chair. Mr. R. Harwood gave a most interesting lecture on his journey round the world. Many of the places so interestingly described by Mr. Harwood were, by the aid of the optical lantern, disclosed to view. The lantern was worked by Mr. James Leach. Mr. Walter Knowles exhibited a most ingenious apparatus, actuated by clockwork, for mechanically rocking the plate during development.

BRAMLEY AND DISTRICT PHOT: SOC:—A new photographic society has just been formed for a district which includes Bramley, Stanningley, Rodley, Pudsey, Farsley, Calverley, Kirkstall, and Armley, and has been named "The Bramley and District Photographic Society." The preliminary meeting was held on the 25th ult., when the officers were duly elected, Mr. Baxter, of Bramley, being the Vice-President, and Mr. F. Halliday, of Beechwood, Bramley, the Honorary Secretary. The Society has a membership of thirty to start with, and promises of joining from many photographers in this district, which is midway between Leeds and Bradford. There has been the need of such a society for some time past. The Secretary will be pleased to hear from any other persons desirous of joining, and also to receive any circulars or catalogues on photographic matters generally. The annual subscription is five shillings. The first meeting was held on the 1st inst., when Mr. H. Crossley, of Rodley, read a paper on "Development," in which he referred to the various developing agents now in the market, and the results which he had obtained with them, showing the members a dozen negatives and prints therefrom, and wound up his paper by giving a practical illustration of "Development with Hydroquinone." A short discussion followed, the meeting being a good one. The next monthly meeting will be on Tuesday, the 6th prox., when the members have to show the negatives and prints of "Childhood," which is the subject decided upon. The meetings are monthly (the first Tuesday in

every month), at 8 p.m., when any friends will be heartily welcomed.

BRECHIN PHOT: ASSO:—The monthly meeting of this Association was held in the Mechanics' Institute, Mr. Shaw Adamson, of Careston, in the chair. A very able and interesting paper on "Hand-Cameras and Apparatus" was read by Mr. Adamson, who treated the subject in a thoroughly scientific manner.

BRIXTON AND CLAPHAM CAMERA CLUB.—On Friday, 11th inst., there was a discussion on "Hand Cameras." Mr. Abraham sent for inspection the Ideal, and Mr. Fallowfield the Facile. Others were on view, including Hockins', and one constructed by a member of the club. At the next meeting on 25th inst., Mr. W. H. Powell will read a paper on "Development."

CARDIFF AM: PHOT: SOC:—On Wednesday the members of the above society spent a pleasant evening with their old friend, Mr. Josty. The lecturer discoursed on a variety of subjects of special interest to the amateur, giving instruction in the manipulation of "home photography," pointing out the best way of utilising the light, and a novel method of filtering same. He also touched upon the pros and cons of retouching, and gave some useful hints *re* the dark-room. Mr. S. W. Allen occupied the chair. This society's winter session terminates on the 23rd inst., when it is proposed to alter the date of meeting from each Wednesday to the first and third Friday of each month.

CROYDON CAMERA CLUB.—The ordinary meeting was held on Friday, April 11th, the President in the chair. The following announcements were made:—First excursion in the field with camera will start at 2 o'clock from headquarters, under direction of Mr. G. White, on Saturday, April 19th; gentlemen not able to meet the party so early can join at Beddington Church at 3 p.m. A cycle run will be held on Whit-Monday. Further particulars will be given later on. Mr. Smith gave a demonstration of the platinotype hot-bath process. Mr. Smith described Mr. Willis' discoveries, upon which the platinotype processes are based, and, passing from theory to practice, toned about forty prints taken from the members' negatives, the hot bath being used. Mr. Smith also showed a very compact and neat hand-camera, called the Key camera; the shutter opens and closes from centre. Speed is very high, but can be slowed down, or used for time exposure. Lens is capable of ready adjustment. The most noticeable feature is the contrivance by means of which the plates are placed in position. During the evening four new members were elected, and several others proposed. Next meeting, Wednesday, April 23rd, when a collection of Bromide Enlargements, kindly lent by Editor of the AMATEUR PHOTOGRAPHER, will be shown.

HACKNEY PHOT: SOC:—On Thursday, the 10th inst., the ordinary meeting of this society was held at Morley Hall, Mr. A. Dean in the chair. The Secretary drew the members' attention to the annual soirée, to be held on the 24th inst., and informed them that the society's orchestra would play on that occasion. The Secretary showed the Eclipse carrier, which Mr. Pringle had spoken of favourably. Mr. Gosling wanted to know whether there was any disadvantage in using a shutter on a detective camera when the shutter went from side to side. Mr. Spratt showed Crouch's hand-camera, and said that there was no vibration with it, and, if anything, it was an advantage. Mr. Carpenter then gave a very instructive paper and demonstration on "Lantern-Slide Making," using eikonogen as the developer, with which he had produced the slides that had taken a prize at the recent Palace Exhibition. The usual vote of thanks was very cordially responded to by the members, who fully appreciated a most interesting paper.

HOLBORN CAMERA CLUB.—The annual general meeting was held on Friday, April 11th, Mr. Dear in the chair. The Treasurer's report showed the club to be in possession of a nett balance of £11 19s. 7d., which, considering that the club has been run for the last fifteen months with twelve months' subscriptions, was considered eminently satisfactory. The Secretary's report showed that the club had nearly doubled itself in the last year, as it now consists of eighty members. Twenty members attended the Southern Counties Cyclists' Camp last August; there were thirty at the club supper, and one hundred members and friends at the annual exhibition and Ciderella dance. The club is also proud of the possession of ten lady members. The following officers were then elected: President, T. C. Hepworth; Vice-Presidents, Messrs. S. Chang, T. O. Dear, F. W. Edwards; Hon. Secretary, J. E. Smith (100, High

Holborn); Assistant Hon. Secretary, E. H. Bayston; Treasurer, Mr. Bell; Librarian, Mr. Gay; Committee, Messrs. R. Luxton, A. Plumbidge, H. Thomson, F. J. Cobb, F. Brocas, E. Benest, and H. Beckford.

IPSWICH PHOT. SOC.:—At the usual meeting of this Society, which was held by the kind permission of Mr. Myddelton-Gavey, in the Mission Room of Brooks Hall, on the 9th inst., there was a large attendance of members, and a still larger attendance of visitors, a most attractive programme being announced. It was a lantern evening, when views taken by members were exhibited by means of a lime-light lantern (on this occasion lent by Mr. Booth), but in addition to the usual collection of amateurs' efforts, a special collection of fine professional photographs had been obtained. Mr. A. S. Fisk, of Woodbridge, contributed a set of splendid views of the Forth Bridge, in all the stages of its marvellous construction, which was explained by a narrative of its history, read by Mr. Woolnough. Following these were some capital photographs by Mr. William Vick, illustrating the Norfolk Broads, which were taken during the Scientific Society's excursion last summer. The members' own efforts were next thrown upon the screen, the following contributing plates:—Messrs. R. Cash, B. Read, B. Corder, A. E. Denny, C. Joslin, J. C. Wiggan, E. R. Pringle, H. W. Younger, and J. E. Curtis. A series of instantaneous photographs, also sent by Mr. Fisk, illustrating the movements of animals, concluded a most enjoyable and artistic evening, a vote of thanks being accorded to Mr. Myddelton-Gavey for the use of the room.

KENDAL LIT. AND SCI. INST. (PHOT. SECTION).—The monthly meeting was held on the 9th inst., Mr. Isaac Braithwaite in the chair. The subject was "A Discussion on Hand Cameras." Various types were exhibited, including the Facile, Eclipse, etc. Mr. Frank Wilson read a paper, contributed to the *PHOTOGRAPHIC QUARTERLY*, on "Hand Camera Work, its Pleasures and Advantages," by Mr. Martin J. Harding. The summer field meetings were talked over, and several arranged for. A hope was expressed that a joint meeting with the Lancaster Photographic Society, as suggested by their Secretary, should take place.

PEOPLE'S PALACE PHOT. CLUB:—At an ordinary meeting of this club held on Friday, the 11th inst., Mr. Beckett, sen., in the chair, a good show of cameras was made, and many interesting tips were given by various members as to little improvements they had made to their cameras, etc. The Secretary explained the working of an Eastman's roller-slide. Mr. Patten brought up a very compact and simple hand-camera of his own construction, and Mr. Beckett showed a very fine 12 by 10 camera which was much admired. Prints were also shown of the views taken by the members who journeyed to Dorking, Surrey, on Good Friday, when a most enjoyable day was spent. This spot abounded with "bits," and altogether formed a very good start for the summer programme.

PHOT. SOC. OF IRELAND:—An ordinary meeting of this Society was held in the rooms, 15, Dawson Street, Dublin, on Friday, the 11th inst.; George Mansfield, Esq., J.P., President, in the chair. Prof. J. H. Stewart gave his lecture on "The Stop and the Optical Centre." Prof. Stewart illustrated his remarks by numerous diagrams drawn upon the blackboard, and in the course of his lecture said the optical centre of a lens had very important properties, and these properties, and how to find the position of the optical centre, should be understood by every photographer. In many cases the optical centre was outside the lens, and this was a very important item to remember. He said that all attempts to grind lenses so as to get rid of spherical aberration had been failures, but the use of a stop not only got rid of spherical aberration, but it also cured the curvature of the field of view. The stop also produced what was known as "depth of focus." Depth of focus was not so much a property of the lens as a property of the stop. By using a small stop depth of focus was obtained; get the nearest object in a picture well focussed, put in a small stop, and everything else must be in focus. A discussion ensued. Dr. J. Alfred Scott described what he termed an instantaneous work formula, and explained how it was possible for a photographer, by making a calculation taking the different factors governing instantaneous work into account, to ascertain beforehand whether it would be possible to get satisfactory results on any given day. The meeting then became conversational, praise of the Society's new dark-room being freely expressed.

STAFFORDSHIRE POTTERIES AM. PHOT. SOC.:—A meeting was held at the Coffee House, Burslem, on Tuesday, April 8th, with

the object of forming a Photographic Society for the district. A number of amateurs were present, and it was decided to form a Society under the name of "The Staffordshire Potteries Amateur Photographic Society." Mr. R. C. Burgess was appointed President, and Messrs. F. C. Powell and J. F. Hewitt, Burslem, Hon. Secretaries. The various details relative to the Society were discussed, and the meeting was adjourned for a week to elect a Committee and enrol members.

TAUNTON AND WEST SOMERSET PHOT. SOC.:—The first general meeting was held on Thursday, April 10th, Lieut.-Col. Ewing in the chair. The consideration and adoption of rules and the election of officers were the chief business. Col. Ewing was unanimously elected President, with the following Committee: Messrs. J. T. Taunton, F. W. Gotch, and C. H. Jeboult. T. Goldsworthy-Crump, Mulberry House, Taunton, Hon. Sec. and Treasurer. A Sub-Committee was also elected to arrange for securing a room, and fitting same as a dark-room. The Society has started with thirty members, and the subscription for the first year has been fixed at 5s., with probably an extra charge for use of dark-room.

WEST LONDON PHOT. SOC.:—A technical meeting of this society was held at the Addison Hall, W., on the 11th inst. The President, Mr. Charles Bilton, occupied the chair for the first time since his recovery from a serious illness. There was a good attendance of members. Mr. Selby showed Rouch's detective, which led to a discussion on hand-cameras in general. One member had found the lever would not always raise the plate; this defect, however, he had managed to set right. Other speakers testified to the capabilities of the camera. Mr. Winter kindly offered to allow members to test his Giah camera. He considered that all instruments should be practically tested before being issued to the public. A discussion also arose as to the comparative effect of printing in platinum in the sun and in the shade, in which several members took part. Mr. Whiting showed a home-made viewfinder, and advocated the more general use of that instrument. Dr. F. H. Low passed round blue prints, some of which had been toned by a process described in a recent almanac, and the Secretary showed aristotype prints from negatives taken by flashlight of wine vaults in the Minorities. Mr. Rickford exhibited negatives, some of which he had intensified, and showed a number of prints from the same by a variety of processes, showing the comparative results which might be obtained. The President announced that the Secretary would read a paper upon "Lenses" on the 25th April, and that the annual smoking concert would be held at the Richmond Hotel on May 9th.

WEST SURREY AM. PHOT. SOC.:—The Society met on the 9th inst., at the Crichton Hall, Clapham Junction, Mr. Winsford in the chair. Mr. James gave a lecture on "Enlarging," to which, however, he was not at all partial. Messrs. Davison and Miall started the discussion. Mr. Davison had on view some platino-type prints by both the hot and cold processes, on various kinds of paper and also fabrics. Several books were handed in for the library in course of formation.

A PHOTOGRAPH IN NATURAL COLOURS.—A correspondent of the *Standard*, writing with reference to the reported discovery of a method of photography in natural colours, says, "A really good daguerreotype always seemed to bear a suspicion of colour, and once, by purely accidental circumstances, I obtained veritable colours. I remember it was an autumn day, one-half the overhead sky was bright, but angry clouds, from which came frequent electric discharges, obscured the rest. My sitter was gaily attired in a black silk gown checked with green, red, and a narrow yellow stripe. All being ready, the then rather impertinent warning was given, 'Now, madam, sit still, if you please and don't wink.' The roar of the rain was at hand, the cap was removed, when the lightning and thunder crash came simultaneously. My subject jumped up with a squeal, and ran away to the house. I had little thought of anything but a failure, the exposure having been interrupted. My astonishment was great on 'bringing out' the picture, to find I had a beautifully delicate, naturally-coloured daguerreotype. I kept my treasure, and many saw it; but after some months the colours faded away. On mentioning these circumstances to a clergyman, he told me that, while receiving lessons in photography at the Polytechnic Institution, London, during a violent thunderstorm, a coloured image was imprinted, not upon the plate, but upon the lens of the instrument. These, and other facts with which I am acquainted, seemed to point to electricity as a means of producing naturally-coloured pictures."

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3696. **Hydroquinone (Thomas's).**—I use as a developer Thomas's formula (hydroquinone), and have made the mixture up by apothecaries' weight (12 ozs. to the lb.). Nearly all my plates, after developing right, and being fixed in the hypo solution, exhibit signs of frilling immediately; they are placed in the water for two or three hours, to thoroughly eradicate the hypo. The plates used are Fry's. What should I do to prevent the frilling? Any information will oblige. —BEGINNER.

3697. **Lens.**—Having a Taylor's single R.V.P. lens, eq. foc. 18-25 inches, I am very anxious to use same with my whole-plate camera, but find the latter too short focus—viz., 20 ins. extension. Can any correspondent give me a handy method whereby I might do this without disfiguring my "set" by anything unsightly in front of camera. —SNIP.

3698. **Loan of Negatives.**—Will some brother amateur please lend me a few quarter-plate negatives of interior and exterior views of cathedrals for lantern-slides. I will pay carriage both ways. —J. A. WATSON (address with Editor).

3699. **Glass Positives.**—Is there any way of taking positives on the ordinary dry plates instead of by the wet-plate process? —GEO. J. GREEN.

3700. **Portraiture.**—Will any reader kindly inform me how to obtain the beautiful softness and definition which characterise a good portrait study, my portraits are always so terribly hard, and black and white, with no soft shading on the face. I have spoiled a good many plates, and should be glad of a little advice before trying again. I use a half-plate R.R. Wray lens with Ilford plates, and Lockyer's hydroquinone developer. I expose for two or three seconds at $f/8$. I have to develop well, or they always fade away in the hypo bath. —A BEGINNER (address with Editor).

3701. **J. T. Mounts.**—Required address of London dealer who stocks these—for negatives $7\frac{1}{4}$ by 5? Have tried several dealers without success. —IRIS BACH.

3702. **Public Buildings in London.**—To whom must application for permission to photograph these be made? —IRIS BACH.

3703. **South Kensington and British Museums.**—Is permission required to photograph statuary in either of the places? If so, to whom should I apply? —IRIS BACH.

3704. **Detective Camera.**—I would be glad if any of your readers could advise me as to the best form, to be used as a detective, or on a portable stand for time exposures. Size of plate, $4\frac{1}{2}$ ins. by $3\frac{1}{4}$ ins. for making lantern-slides. —R. J.

3705. **Ireland.**—Can any reader give me any information as to places worth taking on the following route: Belfast, Larne, Cushendall, Londonderry, Letterkenny, Rathmullen? Also can Ilford half-plates be got at any place here except Belfast? Any kind of particulars of this district will be gladly received by —MEDICI.

3706. **Loan of Negatives.**—Will any brother amateur kindly grant me the loan of a few quarter-plate negatives, views, for the purpose of lantern-slide making? Every care will be taken, and carriage paid. —R. BDDOWES (address with Editor).

3707. **Transparency.**—I want to reproduce a negative from a transparency. Can I do it by gas-light, with what length exposure, and distance from flame? Have failed in all attempts yet. Will some one help me? —CYMRO.]

3708. **Hand-Camera.**—I wish to use my quarter-plate Lancaster's Instantograph as a hand-camera, with a Ross's half-plate rapid symmetrical lens, $7\frac{1}{2}$ in. focus. I should be glad of any particulars how to arrange the plates, and how many could I carry without changing? I have a Thornton-Pickard time and instantaneous shutter to fit lens; could that be utilised? —J. H. J.

3709. **Musty Album.**—I have a large portrait album which has accidentally been stored away in a damp place. I have dried the leaves one by one, put album under pressure, and got all straight again, but cannot get rid of the musty smell. Being a large and well-bound portrait album, I do not care to put aside. Will some reader oblige? —VINCENT.

3710. **Self-Toned Paper.**—Can as good results be got with this as ordinary albumenised paper, and are the prints permanent? Whose make is the best? Any hints will oblige. —VINCENT.

3711. **Copying.**—I am anxious to copy a framed platinum print of a group, and should be glad of advice as to length of exposure and stop to use? I have a Ross's R.S. lens, 8 by 5. —F. A. D.

3712. **Yellow Image.**—What developer will give a yellow image on an ordinary landscape plate? —A. C. L.

3713. **Borax Toning.**—Must the borax toning solution be mixed long before using? —A. C. L.

3714. **Purple Black Tones.**—What paper is recommended for purple-black tones? Where could I obtain it? —A. C. L.

3715. **Silver Solutions.**—I have several bottles containing silver negative and positive baths that have not been used since the wet-plate days. I want to make a solution for sensitising albumenised paper. Will some one give directions and oblige —W. H. H.

3716. **Developer for Ilford Plates.**—Will any amateur please tell me what developer to use for the Ilford special rapid plates (red label). I have used several, but can get no density with them. Also please say what other cheap make of plates is good for drop-shutter work, and what developers? My lens is a Wray's, working at $f/8$; is it possible to do instantaneous work in dull weather? —J. O. S. (address with Editor).

3717. **Polyglot Labels.**—Will someone please give French, German, and Italian for "Photographic plates, to be opened only in dark-room"? —LUCIFER.

3718. **Detective Camera.**—Will anyone kindly tell me whether the Optimus Magazine camera is good and easy to manage? Do the plates or sheaths ever stick? Is the box covered with leather; if not, of what wood is it made? —CORNUBIENSIS.

3719. **Rapid Lens.**—I want a half-plate lens for the most rapid work, to secure models for painting from. Which is best, a Rapid Rectilinear or a Eury-scope? It is to secure animals, children, etc., almost as large as the plate will hold. —ARTIST.

3720. **Intensification.**—Will any reader oblige by giving an explanation how to avoid the appearance of pin-holes in negatives intensified in the ordinary way with bichloride of mercury and ammonia? I soak the negative first, wash well between the solutions; and I don't want to use sulphite of soda, or anything but mercury and ammonia. —GREVE DE LUZ.

QUERIES UNANSWERED.

Mar. 7th.—Nos. 3528, 3530, 3531, 3551, 3554, 3556, 14th.—No. 3566.

21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3601, 3610, 3612, 3613, 3614.

28th.—Nos. 3620, 3628, 3629, 3630, 3633, 3634, 3636, 3637, 3638, 3640, 3641, 3643, 3650, 3652, 3653.

April 4th.—Nos. 3661, 3664, 3669, 3672, 3674, 3677, 11th.—No. 3694.

ANSWERS.

3542. **Purple-Blue Toning.**—You must get from some photographer some fresh home-made sensitised paper, a strong gold bath, and use negatives with plenty of vigour in them, so that the printing can be carried to the bronze stage. —F. DAVIS.

3561. **Negative Varnish.**—If you get some good absolute alcohol it will dissolve any shellac. —F. DAVIS.

3619. **Exeter.**—For permission to take interiors of the Cathedral apply to the Dean. I do not think you will be able to get into the Bishop's garden, but you might inquire of the vergier (an exceedingly courteous and intelligent official, by the way), who might admit you if the Bishop is not in residence. —W. H. H.

3662. **Death Pot.**—Large moths or butterflies are easily killed by pinching the thorax between finger and thumb, or place some cotton wool dipped in chloroform in the bottom of a pickle bottle, and cork down tightly. A stoppered tube should be run through the bung to admit the insect into the death pot. For beetles, a pulp made by pounding young shoots and leaves of laurel, may be substituted for the chloroform. —IRIS BACH.

3665. **Willesden Paper.**—Write to the Willesden Paper Company, Willesden Junction, London, and they will supply you, as they did me, in small quantities. —F. DAVIS.

3670. **Finder.**—"Merci" can make an efficient finder much more simply than as described by "E. W. B.," as silvering a watch glass and cutting it square are not in everyone's power. Obtain a wooden box $1\frac{1}{2}$ inch cube, or thereabout. Cut a circular hole in one end, in which fix a concave lens. At an angle of 45 degs. place a bit of looking-glass, and cut an oblong hole in top. Place on top of camera, and look down. I have had next to no experience of hand-camera work, but find I can shoot very straight with this. —GREENWOOD PIM.

3671. **Exposure for Bromide Paper.**—Eight seconds would do with magnesium ribbon, but I find that as many minutes are needed for oil or gas light. —F. DAVIS.

3673. **Hand-Camera.**—I never use larger stop than $f/10$ for instantaneous work, and develop with Paget's pyro and ammonia developer. —F. DAVIS.

3676. **Argentine Paper.**—There is a formula for this in **AMATEUR PHOTOGRAPHER** of March 14th, 1890, p. 179. —F. DAVIS.

3679. **Hydroquinone, Sediment from.**—The white floury sediment in bottle No. 2 is caused by the water. I have never found it to injuriously affect the quality of developer. To obviate it, use distilled water. —J. A. SINCLAIR.

3680. **Ilford Plates and Hydroquinone.**—The hydroquinone in the solution could not have all been dissolved. —SUNLIGHT.

3681. **Clouds on Bromide Paper.**—Quite easy. Cut out a mask to sky line of picture. Make some marks on paper so that you will be able to superimpose the mask along sky line exactly. Then give the proper exposure for foreground, etc. Replace negative by mask, and cover same with a cloud negative; give one quarter of first exposure, and all will develop together. —F. DAVIS.

3682. **Lynton and Lymouth.**—I have been to both these places, and can testify to the merits of either, and if "Holiday" will communicate through Editor, I shall be happy to give him full particulars that may help to comfort and prevent waste of time. —A. C. T.

3683. **Lens.**—Certainly. It is a very fair all-round lens, and good for the money. —W. A. J. CROKE.

3684. **Lancaster's Rubralux Lamp.**—Either get a new glass made for the lamp a shade lighter ruby, or use a stronger light in the lamp. —W. A. J. CROKE.

3684. **Lancaster's Rubralux Lamp.**—I have found the orange glass fitted to this lamp give an excellent light. If care is used it will not fog rapid plates. —LEX.

3685. **Hydroquinone.**—Thomas' hydroquinone developer gives very good results with their plates, and it is also a good developer for Eastman's bromide paper. —J. MADLEY-WOOD.

3685. **Hydroquinone.**—Have not tried Ilford; but Thomas' is excellent. The quantity of bromide may be increased with advantage. —IRIS BACH.

3685. **Hydroquinone.**—If for Ilford lantern plates, Ilford formula should be used, or a formula containing potassium bromide instead of ammonium bromide. Thomas' formula full strength gives splendid results on Mawson lantern plates. For negatives, 1 part water to 1 part developer. —J. A. SINCLAIR.

3686. **Enlarging.**—Any of the gelatino-bromide papers (I use Morgan and Kidd's) will do, and the formula is sent with them. —F. DAVIS.

3686. **Enlarging.**—I always use Ilford bromide paper. The formula for developing is enclosed with each packet of paper. —SUNLIGHT.

3686. **Enlarging.**—Morgan and Kidd's bromide paper, developed with Thomas' hydroquinone, will give M'Ginty satisfaction. —J. A. SINCLAIR.

3687. **Isoschromatic Plates.**—The screen is of yellow glass, and fits over or into the front of the lens. Its purpose is to render tints in true gradation, by reducing the actinic power of the blue and violet rays of light; obviously yellow rays are not affected by passing through a yellow medium. On an ordinary plate, blue is rendered by white, and yellow by black. Try a bunch of flowers on an ordinary and an isoschromatic plate, and you will easily see difference. Give not less than ten minutes' exposure. Any well-restrained developer will do. —IRIS BACH.

3687. **Isoschromatic Plates.**—To make yellow screen, procure some extra thin lantern cover glasses, and get glass-cutter to cut some small discs just large enough to fit in hood of lens. Cover these with a film of collodion stained to the depth required with a pennyworth of yellow dye. One of these discs can be readily placed in the hood of lens after focussing. Great care must be taken to shade the plates during development, owing to their sensitiveness to ruby light. —J. A. SINCLAIR.

3683. **Blue Prints.**—Try ferro-prussiate paper, as sold by any dealer. Stanley keeps it. —LEX.

3683. **Blue Prints.**—I should think you mean ferro-prussiate paper. It can be obtained at any photographic dealer's. After printing, it only requires washing in two or three waters. —SUNLIGHT.

3689. **Toning.**—The chalky substance is evidently a precipitate from the hard water. I think "Print Spoiler" will find that it is easily removed with a sponge, and will in no way affect his prints. —J. A. SINCLAIR.

3690. **Gold Solution.**—Break a 15 gr. tube of chloride of gold in a 2 oz. bottle, and add 15 drms.

distilled water; each drachm of this solution will contain 1 gr. chloride gold, so any formula may be made up.—LEX.

3890. **Gold Solution.**—From 5 to 8 ozs., according to tone required.—IRIS BACH.

3890. **Gold Solution.**—Mix your 15 gr. tube of gold with 15 drms. of water. You can then easily take any quantity required for your toning bath.—J. A. SINCLAIR.

3891. **Cloud Negatives.**—Go to the seaside, lake-side, or other position whence you have an extended horizon. Use small stop, slow plates, instantaneous exposure, and develop slowly.—F. DAVIS.

3892. **Want of Density in Negatives** is generally owing to over-exposure, or want of patience. I always use Ilford ordinary plates and pyro developer, and I never have any trouble. I cannot assign any other reason but that you do not give the plates time to gain density.—SUNLIGHT.

3892. **Want of Density in Negatives.**—I invariably use the Ilford developer, and never find any difficulty in getting density with Mawson, Ilford, or Thomas' plates. Should suggest "Old Reader's" trouble is caused by over-exposure. Density may be largely increased by flooding the plate with a fresh lot of developer when all detail is out.—J. A. SINCLAIR.

3893. **Blue-Black Tones.**—Try the Mawson lantern plate, a splendid plate in every respect, giving fine black tones with hydroquinone, pyro-potash, or pyro-ammonia. Personally, I prefer them to any other.—W. H. H.

3893. **Blue-Black Tones.**—Mawson lantern plates with iron developer will give required tone. For a beautiful purple black, use same plate with hydroquinone.—J. A. SINCLAIR.

3893. **Blue-Black Tones.**—With the Pall Mall or Kingston, using Thomas' developer, I have never been able to get anything but cold black tones.—IRIS BACH.

3895. **Plates.**—Wratten and Wainwright's, or Edwards' ordinary. For rapid plates, Thomas' T.C.E.R., or either of the above makers' instantaneous.—IRIS BACH.

3895. **Plates.**—If you find Thomas' landscape plates too slow, try their thickly coated extra-rapid. They are quite quick enough for all ordinary shutter work. I do not think you can get any plates to give such good results if you use their hydroquinone developer. One of the best plates for very quick work is Paget's XXXXX. No plate, if properly exposed, should give any trouble in developing.—J. MEDLEY WOOD.

3895. **Plates.**—Edwards's is a magnificent plate. Landscape, 18, instantaneous, 22, Warnerke.—LEX.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

EAGLESBUSH.—The apparatus, complete with the maker's lens, is very reliable at the price, but you will have a much better lens if you buy No. 2.

GOONLAZE, CUCKOO.—We should strongly advise C; it is in every sense a first-class English-made lens. The others are French, and the same care naturally, owing to the price, is not taken in correcting them. We prefer plates G to any of the others.

ALFRED A. MURRAY.—We publish your letter and say a few words in another column.

BAKER HUDSON.—Several books are marked on list sent you.

LAT THIRCKLE.—You do not conform to our rules and give name and address, hence we cannot answer your questions.

CYCLIST.—If required for cycling, Z or X; if for ordinary work, W is far away the best. They are all sent out with finders.

JOHN M. KENNEDY.—A very excellent series of articles by D. Harbord, on "Self-Help in Photography," were commenced in the AMATEUR PHOTOGRAPHER January 1st, 1888, an article being published every other week or thereabouts, up to and including the issue of July 9th, 1888.

TIT WILLOW.—Your letter has been mislaid; we will make a search for it, and write you. What was the subject?

SHARP AND HITCHMOUGH.—Sorry you cannot send your detective cameras to us for inspection. Perhaps you will do so later on, when the stereoscopic detective camera is on the market. We never recommend apparatus to our subscribers unless we have personally had an opportunity of inspecting it, all apparatus sent us is returned within fourteen days, and if it has any novel features, a notice is given in the columns of the AMATEUR PHOTOGRAPHER.

H. C. LEAKE.—If the album is of first class quality, there should be no reason why you should not mount on both sides.

W. I. C.—Your reply is most unwarranted. J. WILLIAMS—Mr. A. J. Melhuish's address is 58, Piccadilly, S.W.

JAMES C. SINCLAIR.—Very many thanks for the trouble you have taken.

P. J. F.—We report upon apparatus at a fixed rate of commission of 2½ per cent. If the maker chooses to send the camera to us we will send you a report, and you can buy upon it or not as you like, but will have to pay our charge. The cost being £5 10s., our charge will be 2s. 9d.

J. O. B.—A very nice tone, but what a pity you lost the crown of the tree in centre of picture, and that the branch protrudes on the right-hand corner of plate. Otherwise the composition is certainly good. We shall be pleased to keep the print. The colour obtained on Aristotype paper, toned with chloro-platinite, and squeegeed on ground-glass, is soft and pleasing.

CANADA DOCK.—A: We should not consider that No. 1 lens in any way compares with either of the others you name, and place them in the following order, 2, 4, and 3. We should advise you to write to the firm No. 2, and ask them the question you ask us. We always recommend an R.R. for all-round work. You will find the No. 2 firm most straightforward people.

TREBLE X.—Under the circumstances, we can see no reason why you should not copy the photograph. Of course you will not sell copies.

A. A. K.—The North Middlesex Photographic Club. Hon. Sec., Mr. Geo. R. Martin, Harringay Park Granary, Green Lanes, Finsbury Park, N. The meetings are held in the Hornsey Road, N., and would be within walking distance for you.

THOMAS AND CO.—We are very glad to hear that the firm have completed your order, and that "the goods are most satisfactory and cheap."

H. C. A.—We have complied with your wishes, and will advise you later on.

H. K.—Please send on negative and transparencies, and call upon us on Monday next.

W. H. FISHER.—We should advise either B or C; they are both most serviceable, and the lens supplied with them will answer your purpose "for all-round work."

E. J. JACKSON.—In a week or so we shall decide what pictures we may need for reproduction.

CHAS. R. CHAPMAN.—Dark-room noted, also your intention to send us "Holiday Resort" article.

T. B.—Your photographs will be criticised in due course if left with us.

C. A. SAMUELS (Bengal).—Your prints are very fair. We have no competition at present in which they are available. No. 1 is rather deeply printed, and lacks definition. No. 2 makes a characteristic picture. No. 3 would have been better with less foreground. We shall be pleased to see more of your work.

W. R.—We should like you to have camera d or e, with lens a or c, but the amount you name will not purchase them. Why not advertise in Sale and Exchange column? You might get a very good 7 by 5 kit for the money. Write us again if we can help you.

ACTOR.—Your prints are in our hands, and will be dealt with shortly, or can be returned if you wish. The Special Number will be issued in due course. We cannot advise you to purchase the camera you name, not having had any opportunity of inspecting it.

GEM.—The camera A is a first-class instrument, and you will be able to do first-class work with it. We should certainly advise C.

H. G. W.—The shutter is a very good one, and is fairly free from vibration.

A. W. P.—No. 1 is considerably over-exposed, and No. 2 considerably under-exposed. This photograph does not suffer from halation, and had the exposure been prolonged, you would have secured a very fair picture. You will remember that the day was quite dull, and you were working with a very small stop. Try again, study your lighting, and you will yet show us a decent print.

J. W. B.—Please send us your address.

DISTRICT EDITORS.—Applications re Bradford, Reading, north of London, Dublin, Dundee, Wolverhampton, Birmingham, Edinburgh, Stamford, Brighton, Newcastle (Staffs), Croydon, and Belfast are receiving attention.

H. A. L. B.—Your views are before us. "Barry Dock" is very good indeed, both as a photograph and a composition. We are also much pleased with "Farmon Castle," the left-hand of your foreground is slightly out of focus. "Farmon Wood," in this picture the foreground might, with advantage, be reduced. The photographs show very careful working and considerable judgment in selection of point of view. Are they to be returned?

A. H. BLANKLEY.—Rules to hand, for which many thanks.

E. G.—(1) The figure may, and, of course, would be, a portrait, but would not come under the class of "Portraiture." (2) Any figure meets the condition.

F. AUYON.—A very capital letter. Much obliged to you.

G. H. RANSOM.—Your letter is simply an advertisement. Let us see your camera, and we will with pleasure write our correspondent, and also give you a notice in the AMATEUR PHOTOGRAPHER.

CAPT. L. LAMB.—Have inserted a query. A. R.—We never name firms; write to any respectable dealer, they will be able to supply you with a suitable changing-bag.

WALTER F. DAVIES.—More care in developing in order to secure a good printing negative, more care in printing and toning. Your toning was in many cases very weak, use more gold.

P. K.—We hope shortly to be able to fix a date. Mr. C. H. Bothamley's articles will be published in book-form when completed.

J. W. SPURGEON.—Your explanations are duly noted.

MALICE (Nice).—You will see your print was in time, and that in another place we comment upon it. It is not compulsory that you should, in sending to the "Ladies' Competition," give particulars as to stop, exposure, etc. You should work out the focal length, and so correctly describe the value of your stops, for rule see "Dictionary of Photography," page 47.

A. E. P.—Quite correct, it would have been near enough to have reduced to one-sixteenths of an inch, but yours are more accurate.

C. H. LEWIS.—We have given instructions to refuse all advertisements, those that appeared were prepaid. Glad you got the best part of your money. Have put your name on the list, you will hear from us. Will write you later on. Mr. T. C. Hepworth is not now attached to the editorial staff.

S. F. CLARKE.—In a few days will answer your letter fully, hope you received photographs.

W. B. PEARCE.—Very glad that the "Competition prints" gave such satisfaction.

H. HOLZ.—All right; shortly particulars will be announced as to our intentions regarding the "Prize Tour Competition" photographs.

G. A.—"J. W. B.'s" address has been mislaid, but as soon as we get it, your letter shall be sent on.

W. A. BRICK.—Sorry to hear that you have not been able to put your camera on the market. Your circular is far too lengthy for us to publish.

H. MACLEAN.—We have put you on the list, and will communicate with you later on.

FRED. TURNER.—Try the following, as used by Mr. A. C. Townshend:—

No. 1.	
Soda carbonate	60 grs.
Water	1 oz.
No. 2.	
Hydroquinone	12 grs.
Soda sulphite	60 "
Water	1 oz.

For use, mix: No. 1, 1 oz.; No. 2, 2 ozs.; water, 1 oz. An increase of hydroquinone gives strength, and dilution with water will produce detail. Or here is another:—

I.	
Hydroquinone	160 grs.
Sodium sulphite	2 ozs.
Citric acid	60 grs.
Potassium bromide	80 "
Water	to 20 ozs.
II.	
Sodium hydrate	160 grs.
Water	to 20 ozs.

To develop, take equal parts of each solution.

Monthly Competition.

No. 11.

GENRE OR FIGURE STUDY.

Title of Print.	Name of Sender.
Lunch Time	H. C. Lancaster
A Regimental Favourite	J. O. Bury
A Fairy Dress Costume	A. J. Ashman
H. A. T.	J. H. Thornton

Forty Winks	G. T. Zimmer
Happy Moments	T. L. Buck

*This competitor's entry form has been mislaid.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, 1d., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Apparatus.—Optimus Magazine Camera, Swift's rapid Paragon lens, Iris diaphragm, f/5.6, cost complete £10, quite new, price £8 10s.; Facile detective camera, nearly new, £2 15s. 6d.; 3B Suter lens, 9 in. focus, £2 15s.; quarter-plate R.R. lens, new, price 16s. complete. — 6, Montford Place, Kennington, S.E.

Three half-plate Tylar's slides, nearly new, 9s. 6d.; canvas bag and straps, ditto, 5s. 6d.; best tripod, in case, 14s.; Ross' carte lens, 35s.; Lerebours' half-plate landscape, 12s.; exchange whole-plate apparatus. — Chalton, Boys' Refuge, Manchester.

Half-plate camera, landscape, leather bellows, rising front, swing-back, two dark-backs (solid), and quarter-plate carrier, rectilinear lens, W.A. landscape lens Special, and cabinet portrait lens, tripod; the lot for 95s., or any above can be had separately. — E. C. Brett, 14, Regina Road, N.

Bicycle.—Exchange 52 in. No. 1 Rudge bicycle, ball bearings throughout, with K.K. lamp, for photographic outfit, including half-plate double extension conical leather bellows camera, with R.R. lens. — Apply, A. C. Belby, Roundhay Park, Roundhay, Leeds.

Cameras.—Camera, mahogany 12 by 10, field or studio, splendid order, used one season, one slide, with carriers, 110s.; or exchange for good Optimus 9 by 7 Euryscope lens. — Snip, Bellshill, N.B.

Camera, Lancaster's 1888 Instantograph whole-plate, with lens; death of owner cause of selling; bargain. — Mrs. Rothwell, 3, Edward Henry Street, Rhyl.

Half-plate camera (by Fallowfield), complete with bellows body, rack and pinion adjustment, rising and cross fronts, double swing-back, three double dark-slides, and good folding oak tripod, a genuine bargain; £2 15s. — A. C. Pemberton, Elm Villa, Neasden, N.W.

Cameras, etc.—Half-plate Underwood's 1889 Instanto, one wooden and three Tylar's metal dark-slides, one printing frame, scarcely used, good as new; for £2 5s. — E. F., 15, Chatsworth Square, Carlisle.

Superior long-extension 5 by 4 camera, three slides, and case; a bargain, 52s. 6d. — Bell, 4, Milton Terrace, Belfast.

8½ by 6½ bellows camera, reversing frame, swing-back, three slides, cost £9 10s., £5; 9 by 7 Optimus Euryscope, £4 10s.; 7½ by 5 bellows camera, reversing frame, swing-back, three slides, £5; 7½ by 5 Hare's changing box, £2 10s. — E. Brightman, Lyndale, Bedland Road, Bristol.

Hare's 10 by 8 long-extending best camera, nearly new, three slides, every movement; sell 8 guineas. — 1, Dunkeld Villas, Plymouth.

5 by 4 camera (by Louis Gadolph, London), 12 in. focus, taper bellows, rising front, reversing back, rack adjustment, three double backs, Aptus finder, and Optimus best waterproof case, velvet-lined; £3 5s.; approval; deposit. — H. S., 75, Loampit Vale, Lewisham, S.E.

Camera Case.—Camera case, Lancaster's waterproof, stiff leather bound, new, 11 by 8 by 11; 8s. 6d.; approval 6 stamps. — 6, Albion Cottages, Avenue Road, Stamford Hill, N.

Enlarging Apparatus.—Marion's enlarging apparatus, 7 in. condensers, new, cost £7, further particulars if wanted; would exchange for f/11 rapid rectilinear lens by good maker. — H. Wigan, East Malling Vicarage, near Maidstone.

Hand-Cameras.—Hand-camera, as described in 1890 "Year Book" by Hethorn Lewis, for sale, quite new, six double backs, focussing arrangement, can be used on a stand or in the hand, fitted with Taylor's detective lens, 5 in. focus; price £7 10s., or £4 without lens; cost £9 10s. — 54, Chestergate, Stockport.

No. 2 Kodak (£7), just new, with extra roll of film (10s. 6d.); £8 10s. — B. Boothroyd, Southport.

Kodak detective camera, equal new; cost 105s.; price 70s. — Bygrave, 15, Canterbury Road, Brixton, S.W.

Rouch's Eureka, very little used; price £5; cost £6 12s. 6d.; deposit system. — Hatfield, St. Philip's Vicarage, Southport.

Lenses.—Lens, Lancaster's Instantograph half-plate, with instantaneous shutter; cost 37s. 6d.; what offers? — H. G., 15, Grosvenor Road, Rathmines, Dublin.

Optimus Euryscope, 7 by 5, new, price £3 10s.; Newman's shutter to ditto, new, 27s. 6d. — Orme, Studio, St. Petersburg Place, Bayswater.

Single lens, new, with stops, covers 5 by 4 plate; price 7s. — H. K., 171, Caledonian Road, London.

Optimus 7 by 5 wide-angle portable symmetrical lens, new; cost 52s. 6d.; take 39s. 6d. — Blake, 99, Edinburgh Road, Liverpool.

Optimus rapid rectilinear 12 by 10 lens, cost £7, nearly new; will take 50s. — Address, Piggins, 95, Old Kent Road.

Dallmeyer's 7 by 5 wide-angle landscape lens, equal new; cost 75s.; sell 47s. 6d. — Day, AMATEUR PHOTOGRAPHER Office.

Lens, Shutter, etc.—Quarter lens, Instantograph, and shutter, elliptical shutter, with release, fit same lens, "British Journal," December 6th to date, vol. 1. "Photography," missing 1, 5, 6; exchange for half-plate camera and slides. — J. T., 4, Heatherside Road, Ewell, Surrey.

Lens and "Amateur Photographer." — Taylor's 5 in. fixed focus lens, Iris diaphragms; cost £3 17s. AMATEUR PHOTOGRAPHER, first nine vols., with all supplements and specials; offers; deposit. — Walter Talbot, 15, Cromwell Road, S.W.

Magic Lantern.—Lantern, 4 in. condensers, oil and lime, half-plate R.R. and W.A.R., for sale; or exchange good Safety bicycle with ball bearings. — C. Naylor, Batley.

Print-Washer.—Rotary print-washer, new; cost £1; what offers? — G. Fitch, Clovelly, Mayfield Road, Moseley, Birmingham.

Roller Spools.—Two Eastman roller spools; 5s. each. — Fry, 172, Edmund Street, Birmingham.

Safety Bicycle.—Exchange my Safety (Psycho), new last season, balls all over, and accessories, cost over £15, ball pedals, only used once, for really good make half-plate set by reliable maker; photograph 2 stamps. — W. Drake, 15, Thornton Road, Bradford.

Sets.—Quarter Merveilleux camera, rapid rectilinear Optimus lens, stand, two double slides, adapter; 40s. — Fisher, 31, Womersley Road, Hornsey.

Quarter Instantograph set, complete, two double backs, shutter, also half-plate rapid rectilinear lens; exchange 7½ by 5½ or whole plate Ross' symmetric or Optimus Euryscope, good condition. — Loftus Buscombe, Turret House, Bodmin.

Lancaster's whole-plate camera, two double backs, dark-slides, strong tripod and case, also splendid Eureka lens; price £5. — Tunstall, Amateur Photographic Association, 3, Lord Street, Liverpool.

Quarter-plate Brown's camera and three backs, Wray lens, with Iris diaphragm, folding mahogany stand, Newman's time shutter and finder, in solid leather case; cost £10 15s.; take £6. Also a 12 by 10, a No. 3 Suter lens and 5 by 4 camera with three backs; what offers? — Horne and Thornthwaite, 416, Strand.

Robinson's long-focus camera, quarter-plate, new last year, with stand and lens; cost 4 guineas; will sell for 40s. — E. H., 47, Maclise Road, Kensington, W.

Underwood's half-plate President, five slides, shutter, Optimus Euryscope, Ashford's stand; £9 10s. — H. Short, Perryn Road, Acton.

Half-plate Lancaster's Instantograph, one double back, landscape lens, and Lancaster's patent shutter, mahogany folding stand, new three months ago; £3 5s.; approval on deposit. — G. Manning, 97, Church Road, Nechells, Birmingham.

For sale, quarter bellows camera, Instanto lens, Iris diaphragm and shutter, tripod, double back; 22s. 6d. the lot; suit beginner. — T. B., 77, Anerley Road, Anerley.

Splendid half-plate camera, three slides, tripod, and case, all movements, new last season; cost £9; take £5 10s.; approval; particulars. — 315, Crookesmoor Road, Sheffield.

Marion's half-plate camera, with swing-back, reversing frame, sliding fronts, and three double dark-slides, leather case, and tripod stand, all new; cost £4 14s. 6d.; will accept £1. — P. H., 10, Appach Road, Brixton.

Lancaster's quarter-plate International camera, rectilinear lens, with Waterhouse stops, instantane-

ous shutter, tripod, two double dark-slides, waterproof case, washing rack and tank, etc., nearly new, genuine set; price £3 10s. — Swain, 28, New King Street, Bath.

Camera, Optimus half plate, square bellows, double extension, all adjustments, three double backs, new last year, perfect; list price £8 17s.; offered for £3 17s. Canvas case, 10s. — Davis, 87, Church Road, Richmond, Surrey.

Lancaster's Special 1886 camera, double slide, quarter-plate carrier, Optimus 7 by 5 rapid Eury-scope lens, stops, stand, and focussing cloth, nearly new; £3. — Optimus, 169, High Street, Ramsgate.

Half-plate Instantograph, good as new, all latest improvements, three mahogany double slides, lens, shutter, carriers, and tripod. — C., 72, Manor Street, Clapham, London.

Shutter.—Newman's whole-plate shutter, with adapter to work in front of lens; sell for £1, or useful exchange. — V. A. G., 20, Pembroke Road, Kensington.

Sundries.—Large camera and several other things, cheap. — Thos. Pinlott, Whitley Road, Macclesfield.

Clearing out.—Whole-plate camera, double back, all latest improvements, sacrifice 55s.; also half-plate camera, double back, with lens, a bargain, 45s., as new; plate-washer, quarter and half, 4s.; whole-plate Doublet, by Taylor, 50s. — J. Cresswell, 118, Watnall Road, Hucknall, Torkard.

Whole-plate camera and set, £8; Kodak, 70 exposures remaining, £3; Salvo tricycle, £7; Safety bicycle, £3; AMATEUR PHOTOGRAPHER, No. 32 to date, 10s. — R. P. Stuart, Lichfield Barracks.

Nine dozen half-plates, Iford and Marion's extra-rapid, 19s.; one dozen ordinary ditto, quarter, one dozen half Morgan and Kidd's ultra-rapid, three dozen quarter ditto, 4s.; 15 bottles Schering's pyro, 12s.; Burrow's and Colton's "Art of Retouching," with illustrations and negatives, 2s. 6d.; Edwards' ruby lamp, 2s. 6d.; view lens, 12 by 10, focus 14 ins., diameter 2½ good and quick for portraits, no flange, 10s. — Marshall, Hill Side View, Old Park, Bristol.

WANTED.

Amateur.—Wanted, an amateur, residing in Warwick, to take quarter negatives. — Wirth's, 15, Long Lane, E.C.

Amateur Photographer. Nos. 170, 171, 173, 175, 178, 205. — B., 53, St. Thomas's Road, Finsbury Park.

Cameras.—Stirn's Vest camera, large size. — Faulkner, Rue Hameau, Pau, France.

Half-plate Instanto camera and slides, good condition, cheap, for cash. — Chalmers, Watchmaker, Beaulieu.

Camera, etc.—10 by 8 camera, square bellows, reversing and swing-back, good maker, Meagher's preferred. — Bond, Bolimin.

Hand-Cameras.—Facile, fitted rectilinear lens; accept same and £5 for high-class half-plate set, new. — Tucker, Herrick Road, Loughborough.

Lenses.—Ross' rapid symmetrical lens, half-plate or larger, in good condition, cheap. — Address, Glazebrook, Melling, near Liverpool.

Lens, 7 by 5 R.R. Optimus (latest pattern), or other good make, cheap; send to Editor for inspection. — MacManus, Athlone.

18 or 20 in. rapid rectilinear, and 8 in. portable symmetrical, by good maker. — H., 10, Bishopsgate Avenue, E.C.

A Ross' or other good maker's quarter or half plate rapid rectilinear lens. — Box 13, Kandal.

R. R. lens, half-plate, about 7½ in. focus; approval; deposit. — C. Sharp, St. Andrew's Road, Plastow, E. R. R. lens for half-plate camera; state focal length. Address, Dundalk, care of Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, Ludgate Hill, London, E.C.

Quarter-plate rapid rectilinear or landscape lens, week approval. — Harris, Windsor Road, Aintree, Liverpool.

7 by 5 Optimus R.R. lens, in perfect condition; approval required; state lowest price. — T. B. Berey, Athenaeum, Liverpool.

Lens and Roller Slides.—Wray's 5 by 4 R.R. lens, and Eastman's quarter and half improved roller slides. — Haynes, Wharfedale Chambers, Sheffield.

Roll-Holders.—Morgan and Kidd's roll-holder, perfect condition. — Hawksley, 76, Roe Lane, Southampton.

Eastman's quarter-plate roll-holder. — State lowest price to Appleton, Cleveland Mills, Stockton-on-Tees.

Eastman's improved quarter-plate roll-holder, must be cheap, for cash. — Garner, jun., Uxbridge.

Sets.—Complete half-plate set, by good maker; full particulars. — Sharland, Poltimore Terrace, Exeter.

For cash, Lancaster's 1889 Instantograph or other good half-plate set, good lens; give full particulars and lowest price. — O. C. Kirby, 21, Dickinson Street, Manchester.

Lancaster's quarter-plate camera, complete, requisites, etc.; approval. — Knights, 73, High Street, Braintree.

Half-plate rapid rectilinear lens, by good maker, half-plate camera, two double slides, stand, cheap; state particulars. — Davitt, 3, Baltic Street, East Hartlepool.

NOTICES TO SUBSCRIBERS.

Subscriptions must be prepaid.

UNITED KINGDOM	Six Months, 5s. 6d.....	Twelve Months, 10s. 10d.
POSTAL UNION	" 6s. 6d.....	" 13s. 0d.
INDIA, CHINA, ETC.	" 7s. 9d.....	" 15s. 3d.

NOTICES AS TO ADDRESS.

PUBLISHING DEPARTMENT.—All letters containing Subscriptions, Orders, Remittances, SALE and EXCHANGE Advertisements, or other business matters for the *Amateur Photographer* are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—SALE and EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

ADVERTISEMENT DEPARTMENT.—All communications respecting TRADE Advertisements in the *Amateur Photographer* are to be addressed to PARRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—Trade Advertisements are received up to Tuesday morning.

EDITORIAL DEPARTMENT.—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or Apparatus for Notice or Review are to be addressed to the Editor, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

NOTE.—To ensure insertion all Communications should reach the Editor on Tuesday.

CORRESPONDENCE SECTION.—Anyone wishing to communicate with Contributors can do so by forwarding such Communication in stamped envelope under cover to the Editor, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

THE "AMATEUR PHOTOGRAPHER" FIRST LADIES' PHOTOGRAPHIC COMPETITION.

PRIZES.

First Prize	Gold Medal.
Second "	Silver Medal.
Third "	Bronze Medal.

(These Medals, of the smaller series, will be appropriately mounted as Brooches).

SUBJECTS.

Landscape or Seascape—Landscape with Figure—Genre or Figure Study.

NOTE.—The adjudication will be made by lady artists and lady photographers. It is hoped that it will be possible to make arrangements to exhibit the photographs at a *Conversazione* to be held in the offices, 1, Creed Lane, E.C., during the month of June.

Further particulars on application to the Editor, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER"

MONTHLY COMPETITIVE PAPERS, 1890.

The following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.
Three Prizes of 0 10 6 each.
And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his *personal experiences*. It is intended that each subject shall be written up by a specialist for the *ANNUAL*, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

Subjects.

28th April	Action of Light.
28th May	Exposure.
28th June	Plates and Films: their Development and After Treatment.
28th July	Printing, Toning, Mounting, and Finishing.
28th August... ..	Artistic Effect and Composition.
29th September	Outdoor Instantaneous and General Photography

All MSS. to be addressed to the Editor, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE PROPRIETORS of the *AMATEUR PHOTOGRAPHER* will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP),

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	June 14.
LANDSCAPE WITH FIGURE	July 14.
GENRE OR FIGURE STUDY	Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, — ANIMALS, ETC.	May 14 .. Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors.

In addition to the Medals being given, the prize photographs will be produced in the *AMATEUR PHOTOGRAPHER*.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Competitive prints are available for exhibition before Photographic Societies after the 1st of each month.

The prints will all be numbered, and when sent to societies, will be accompanied by a book for criticism. It is hoped that the President or other official will give a note stating the general opinion of the members of the Society.

Entry forms on receipt of stamped addressed envelope.

THE "AMATEUR PHOTOGRAPHER'S"

1890

TRAVELLING STUDENTSHIPS.

PRIZES.

First Prize	£30 0 0	Fourth Prize... ..	Gold Medal.
Second "	£21 0 0	Fifth "	Silver Medal.
Third "	£14 0 0	Sixth "	Bronze Medal.

The *AMATEUR PHOTOGRAPHER* Certificate, duly signed by the Judges, will be presented to the Prize Winners.

SUBJECTS FOR COMPETITIONS (Not less than Six Prints):

LANDSCAPE or SEASCAPE.—LANDSCAPE with FIGURE.—GENRE or FIGURE STUDY.

Rules, entry forms, and forms for declaration will be ready shortly. All those wishing to compete should apply to—

The Editor, "*AMATEUR PHOTOGRAPHER*," 1, Creed Lane, Ludgate Hill, London, E.C.

Vol. XI. No. 290.]

FRIDAY, APRIL 25, 1890.

[PRICE TWOPENCE.]

✿ OUR VIEWS. ✿

To hold as 'twere the mirror up to nature."—*Shakespeare.*

THE Bedford and District Camera Club have got to work and have arranged a capital programme for May. The Hon. Secretaries, Messrs. Alex Kirby, jun., and C. Perrott Smith, will be pleased to give all particulars to intending members.

* * * *

THE Secretary of the Oldham Photographic Society has been kind enough to forward us the programme of Rambles for 1890, which is admirably drawn up, and embellished with portraits of the executive, taken by the Vice-President, Mr. W. Thompson, and most tastefully arranged. We have a lively recollection of the very novel card issued in 1888, and must congratulate the Council for combining art and usefulness.

* * * *

THE editor of *Our School Magazine* is interesting himself in forming a Photographic Society for Woolwich. We publish a letter from him in another column; he will be pleased to hear from workers in photography who will be ready to help in the formation of a Society.

* * * *

THE members of the Auckland (N.Z.) Photographic Club are doing good work. At a recent meeting we understand that a member, Mr. Francis, read a paper upon "Eikonogen," and that another member, Mr. H. B. Morton, exhibited negatives developed by eikonogen, and others under similar conditions developed with hydroquinone. The results were good, in both cases, and some difficulty was found in discovering "which was which."

* * * *

In last year's Lantern-Slide Competition we had a slide entered, entitled "Hardham Lock, near Pulborough," and we should much like to know the name of plate and process. "If this should meet the eye" of our competitor, will he forward particulars? The slide attracted considerable attention when shown recently before the members of a photographic society.

WE are pleased to notice that Messrs. Anderson, Anderson, and Co., 5, Fenchurch Avenue, London, E.C., who are advertising "Pleasure Cruises to the Land of the Midnight Sun," are able to notify that dark-rooms have been fitted up on board the Orient Company's steam ships *Garonne* and *Chimborazo*. These vessels sail from London, calling at Leith. Further particulars will be found in our advertising columns.

* * * *

WE have no doubt the day is not far distant when "Dark-rooms" for photographic purposes will be attached to the Scotch and Irish expresses. What more delightful occupation for a long railway journey than the developing of negatives!!

* * * *

EARLY in May we shall again commence the publication of our list of towns in which we have the use of "Dark rooms." They will be under three headings—"Amateurs," "Professionals or Dealers," and "Hotels." As heretofore, cards of advice will be sent to the owners, and a letter of introduction setting out most complete particulars, which will include very useful information. In order in some measure to recoup us the cost of organisation and clerical work, it is intended to make a charge of *sixpence* for each application, which must, of course, be remitted in stamps. We hope in the cases of hotels to be able to secure to all photographic workers introduced by us the benefits of the tariff arranged for by the executive of the Cyclist Touring Club. We shall be glad of as much help as possible from amateur photographers residing in seaside towns or touring resorts, who may have "Dark-rooms." Every care will be taken by us to introduce only those who are thoroughly *bona fide* and respectable.

It will much expedite our arrangements if those ladies or gentlemen who are willing to grant us the use of their Dark-rooms will send us a note at once, so that the necessary form to be filled up may be sent them.

We have circularised the Secretary of every photo-

graphic society, and hope many societies having a Dark-room will allow us to introduce visitors. We shall especially notify time room available, amount of subscription for temporary membership, and any other particulars that may be desirable. We see in this "Register of Dark-rooms" a means to help the organisation which we intend to carry out, and trust our readers all over the kingdom will give us a helping hand. The growth of photographic work is enormous, and takes all our energies to keep up with; it will only be with the help of all that we shall be able to keep abreast of the times.

* * * *

WE are pleased to announce that we shall publish the Rev. Precentor Mann's "Three Weeks in Brittany," in the form of "Prize Pictures," reproducing several pictures by the Woodbury process. Mr. Paul Lange's "Norway" will be issued in the same form, the pictures being reproduced by the same process. The books will be exactly similar in style, and companions to Alex. Keighley's "Prize Pictures." Other contributions to our "Prize Tour Competition" will be published, but we are not at present prepared to state in what form.

* * * *

WE are always pleased to notice any firm who are assisting to advance and elevate processes for the reproduction of photographs. We have before us the prospectus of "Photophane, Limited," a company formed to work the Photophane process. Our readers will remember that in "Holiday Work," 1888, we reproduced a very charming photograph of Mr. Alfred Stieglitz's, entitled "A Good Joke," by the Photophane process. We quite believe there is a very large amount of business to be done by the process, and at no distant date shall place some of our work in the hands of the Company. As an investment, we are of opinion that the concern should pay, if rightly managed, a very fair and remunerative dividend upon money invested. Already a considerable amount of work has been done, and we hope the Company will secure the capital they require, and so be able to make the necessary extensions, and erect the additional plant needed to execute reproductions of photographs, which purpose the process is so admirably adapted to carry out.

* * * *

WE have been advised that it is proposed to hold an exhibition of photographic work and apparatus, under the auspices of the Edinburgh Photographic Society, in the galleries of the Royal Institution, Edinburgh, from about the middle of November in the current year, and extending over a period of about two months. The arrangements for the Exhibition have not yet been fully matured, but they will be completed, it is expected, at an early date, and will be duly announced. The recent correspondence in the AMATEUR PHOTOGRAPHER has been the means of waking up the Council to the necessity of doing something. The time chosen is not likely to induce many from the South to visit Edinburgh, but we suppose the Council of the Society know their own business.

* * * *

THE following from a competitor in the last "Monthly Competition" is exceedingly gratifying:—

"Allow me to take this opportunity of returning my heartiest thanks for the kind, lenient, and favourable

manner in which you have treated my humble productions. I have been jogging on in a quiet way since my commencement of photography, my principal incentive to strive on being your very excellent journal. Now I have attained to an 'honourable mention' therein, I feel awfully proud, and am going to do my 'level best' to carry off one of your very valuable and much coveted prizes."

* * * *

MR. JAS. DUDIN, of Roseneath, Chase Green Avenue, Enfield, writes us that he thinks a Camera Club might be started at Enfield. Perhaps our readers who are resident in the district will communicate with him.

* * * *

A RECENT prize winner writes: "I think the thanks of all amateurs are due to you for the very just and fair rules under which this (Prize Tour) Competition was held. It appears to me that when a competition of this class is thrown open to works that have gained many prizes and been exhibited times without number, and which cannot be passed over without awards, the ostensible object of the competition, the encouragement of amateur photography, is entirely defeated." Vulgarly we would say, "Them's our sentiments;" and we intend to work for one picture one medal.

* * * *

PRACTICAL application of photography has found yet another sphere. Mr. Alfred Watkins, of Hereford, has photographed the Pigeon-houses of Herefordshire, and, quite recently delivered a lecture, illustrated with lantern slides taken from his negatives. Mr. Watkins has photographed no less than seventy-three dove-cots or pigeon-houses, and is, of course, learned in dove-cot lore, a subject which may have some interest to our readers. We only call attention to the work in order to once more urge amateur photographers to go in for practical photography, and not be content with "picture making."

* * * *

ON Thursday the Blackburn and District Photographic Society opened their new meeting-room and dark-rooms in Royal Chambers, Victoria Street, Blackburn. The Secretary advises us that the rooms are open daily for the use of members, and that non-members and visitors can have the use of the dark-room on application to him.

* * * *

ON the 30th inst. Mr. T. R. Dallymeyer will read a paper upon "Photographic Lenses," before the members of the Society of Arts.

* * * *

A CORRESPONDENT writes—"The proposal to form an Amateur Society in Edinburgh is the general topic in this neighbourhood amongst readers of the AMATEUR PHOTOGRAPHER, and if pushed on by those who have already written you on the subject can easily be brought to an issue. I know half a dozen myself ready to join it."

* * * *

WE are pleased to note that the members of the Glasgow and West of Scotland Amateur Photographic Association are going to take up some thoroughly practical and useful work for the summer. An excellent scheme has been formed to take a series of pictures and to gather together

all the best views in the West of Scotland. The pictures are to be taken during six excursions, viz.—Glasgow; the Upper Clyde; down the Clyde; Loch Fyne and Arran; the Land of Burns; Loch Lomond and Trossachs, via Balloch. At the end of the season lantern slides will be made, and they will be shown at the Association's meetings, under the title of the "West of Scotland set of lantern slides." We hope the Council will loan the slides to other societies. In the South particularly, many will be delighted to have the opportunity of seeing depicted on the screen the charming scenery of the West of Scotland. We congratulate the Glasgow men upon their enterprise, and are sure that their summer work, if carried out according to their programme, will give them pleasure whilst securing the pictures, and will also afterwards give pleasure to thousands of others if they will loan them to kindred societies in the United Kingdom.

* * * *

THE holiday season is fast approaching, and already many are making their arrangements. A correspondent, a doctor, writes us that he is very anxious to proceed to Switzerland for three or four weeks, especially to photograph snow scenes, work that he started last year, and is very wishful to secure the company of a companion interested in the same work. We shall be pleased to give the doctor's name and address to any of our subscribers. We are quite sure that they would derive pleasure and instruction by his companionship.

* * * *

PHOTOGRAPHS AT NEWCASTLE.

In another column we publish a full list of the awards. We had the privilege of being present at the opening of the Exhibition on Friday in last week, and found that in Newcastle and district there are many ardent and faithful workers in photography. The district covered by the Association has resident in it professional photographers who have made their name, and who rank in the very first line of practical and art workers.

The Exhibition is well arranged, and some 1,000 photographs are shown. The amateur work is not of a high standard, except by those who entered the classes open to "Professionals and Amateurs," and in these classes we see familiar faces, and we venture to say that all the competitors are *pronounced* medal hunters; they have been hunting in Newcastle with the same pictures that they have been exhibiting all the winter season, but as a matter of fact these exhibitors are conspicuous by their absence in the list of awards. Mr. J. E. Austin takes *four* medals, all in the classes open to amateurs and professionals. In these classes we notice three medals are given to Americans, one to Mr. J. G. Bullock, and two to Mr. R. S. Redfield; and four medals are given to amateurs, for lantern-slides, Messrs. J. E. Austin, Henry Little, Jas. A. Sinclair, and Edgar G. Lee. Out of a total of thirty-four prizes awarded open to both classes of workers, ten go to amateurs (four to one man), and the remainder to professionals. In lantern slides, out of nine prizes awarded, five go to amateurs. In general work, out of twenty-five prizes awarded, five only go to amateurs, three to Mr. Austin, and two to our American cousins, Messrs. Bullock and Redfield.

These facts will show conclusively that it is absurd to couple the two classes of workers together.

We shall deal principally with prize pictures in "Landscape work above whole-plate;" the silver medal is awarded to Messrs. Green Bros., for "Stybarrow Crag, Ulleswater," "Blea Tarn, Langdale," and "Derwent-water and Skiddaw, from above Lodore," all masterful pictures, printed in platinotype, rather more deeply than we are accustomed to see Messrs. Green's pictures, with, we think, very distinct advantages. The bronze medal goes to Mr. J. P. Gibson (Hexham), for, in our opinion, the finest set of pictures in the exhibition, most delightfully composed pictures, printed in platinotype, toned to a warm sepia tint. These pictures, of which there are ten, are faultless, and the judges have done well in pricking "Weary," "The Road to the Mill," and "Autumn Haze;" in this latter picture there has been no dodging, but the effect is true to nature and very charming. Mr. Gibson also sends a fine series of "Cloud Studies," which are worth special notice. Other exhibitors in this class are Robinson, *père et fils*, the former sending the "Lobster Boat," and three pictures having no great merit, "Make Hay while the Sun Shines," "In Charge," and "A Mishap;" the latter sends three pictures, "A Helping Hand," "Sweet Spring-time," and "Baby's First Harvest," all well composed, but certainly not to be compared to Gibson's work. Mr. Sutcliffe contributes "The Ingathering" and "The Evening Hour;" these are not without fault, and we are not at all surprised that the judges passed them over. In the former the "lumber" in the right-hand corner is out of focus and too crowded. A worker of the standing of Mr. Sutcliffe must be careful about small matters.

In the class "Landscape, whole-plate and under," Mr. Gibson takes the silver medal for a most extensive exhibit of some fifty photographs. The views, "By Merry Tyne, on Moor and Lea," are well selected. Every one of these photographs is a picture, and they are in themselves worth a visit to the exhibition. It is impossible to notice them in any detail; they are printed in a warm sepia tint, and are a pleasing, and, to our mind, delightful contrast to the cold, grey platinotype that has become the "rage" for all subjects during the last year or so. We are glad to see a reaction in favour of warmer tones. The bronze medal was given to Mr. Austin for three pictures, "The Last of the Ebb," "Listening to the Bells," and "By the Tow Path," all much-exhibited pictures, and not always with success. Our American cousin, Mr. Bullock, secures an extra bronze medal for three views, which are certainly good, especially the view "On the Wawasett." Some good work is shown by Mr. Parry (S. Shields) on a matt-surface paper, which has been toned to a warm tone, the paper being sensitised by the ammonia nitrate process. A very instructive chapter upon this process will be found in "Silver Printing," by W. M. Ashman.

In the next class, "Landscapes on gelatino-bromide paper," only a silver medal is given, and this, in our opinion, is one of the weakest awards the judges made. The medal is given to Messrs. Auty and Ruddock for a "View on the Irthing," a really charming view well composed and lighted, but completely spoilt by the use of the brush *on the print*. Light is introduced where it would be quite impossible for it to be; the water is streaked and rippled in a most illegitimate manner; nature is improved (?) by this exhibitor, not wisely but much too well. We do hope professionals are not going to commence to

"work up" pure landscapes. The class altogether is a poor one, and the judges might have given the prize to any other competitor with equal if not more justice. In this class Mr. Welford shows four pictures which, if "View on the Irthing" is to be taken as a standard, deserve recognition.

In Portraiture the silver medal is given to Mr. J. Lafayette, for "Mrs. Langtry"—a painting, and not a photograph—"Miss Moody," and "Portrait of a Lady and Child." This exhibitor paints or works up his portraits admirably, but they are not in any sense photographs. Such work should be entered in a special class if it is necessary to exhibit it at all, but certainly ought not to be classed with such magnificent photography as that shown by Mr. W. Crooke (Edinburgh); his "John Mackenzie," "Stalwart Knight," and "Portrait of a Sikh" are unsurpassed for direct work. Mr. W. J. Byrne took the bronze medal with three portraits, 24 by 21 (direct and untouched), large shiny, inartistic pictures, with each particular detail standing out in most obtrusive realness; six portraits of the Emperor of Germany, better lighted and character brought out, due to the sitter and not the operator; ten "At Home" panels, taken by daylight at sitters' own residences. These may, and no doubt do, please the sitters, but they do not elevate photography. It is significant that no amateur, except our American cousin, Mr. Bullock, and the ever present Austin, with "Harmony," "Song," and "At the Pantomime," have entered this class. Mr. Winter exhibits several of his well-known and beautiful portrait studies, but he is passed over for the painter. Mr. Lyd. Sawyer exhibits portraits printed on Whatman paper; he also sensitises with ammoniacal nitrate bath. For portraits the effect is charming, and will, we are sure, be very popular amongst amateurs, especially for figure studies. Mr. R. W. Robinson contributes four of his excellent pictures, "Artists at Home," which are up to the standard of those previously shown. Other exhibitors who show good work are Mr. J. W. Beaufort, Mr. E. Greaves, and Mr. Thos. G. Whaite.

We shall have to continue our review next week. The Exhibition is a certain success, it has been largely attended, and the lecture on Friday last, by Mr. Paul Lange, on "Norway," drew a crowded house. It was listened to with much pleasure and attention. The Secretaries, Messrs. Lee and Brown, and the Executive are untiring in their attentions to exhibitors and visitors.

Letters to the Editor.

DISTRICT EDITORS.

SIR,—I had intended writing you before this regarding your suggestion of appointing District Editors, and as to which I note you invite the opinions of your readers.

It has occurred to me that the work of these District Editors would consist chiefly of reporting the meetings of the various societies, and as, under the existing system, the doings of a society are usually reported by one of its members, this particular member often uses the means thus afforded him to show to great advantage what he himself and one or two of his particular friends stated, or should have stated, whilst he ignores or ludicrously reports any who do not command his good graces; in other words, the present system, to my mind, is simply a facility for one member of a society to blow his own trumpet and that of a few of his particular friends:

not to speak of the cases where incompetent writers distort and render absurd utterances of speakers.

Now, my suggestion is that, at any rate so far as the metropolis is concerned, the District Editors should not be members of any society within their own district, and preferentially should be reporters, in which case they would not take part in the discussions, thus remaining unbiased in their opinions.

You have only to compare the reports given of the meetings of the larger societies, such as the Photographic Society of Great Britain, the Photographic Club, etc., with those contributed by members of the smaller societies, to see that the former are much more valuable and reliable than the latter, and that my suggestions are well grounded.—I am, yours, etc.,

A VICE-PRESIDENT.

* * * *

THE PROPOSED ILFORD SCHOLARSHIP.

SIR,—I am sure you will join me in deploring the conclusion reached in this matter, as shown in subjoined letters; and allow me to say, through your next week's issue, that I can only look forward with hope to the good time to come, when we shall have more cohesion between the various societies, more unanimity of purpose in the endeavour to add to the dignity of photography, and less airing of presumed personal grievances and idiosyncrasies. Then the amateur and professional, as such, will exist no longer, but all will be photographers without any invidious distinction, other than merit; and all will form a race, by training and education, infinitely superior to their fellows of to-day.

The Britannia Works Company hoped that their offer of a scholarship would have been the foundation-stone of such a utopia; but it seems we are ahead of the times. No one appears equal to the task of laying that foundation-stone aright.

When some one society or a committee of leading men see their way to fitly utilise the gift, it will be waiting for them.—Yours faithfully,

JOHN HOWSON.

The Britannia Works Company, Ilford, London, E.

April 18th, 1890.

To J. Howson, Esq.

Dear Sir,—With reference to your letter of the 29th ult., I am directed by the Council of this Society to send you a copy of the following resolution which was passed yesterday evening, "That the Council of the Photographic Society of Great Britain, while thanking the Britannia Works Co. for their offer, regret that after due consideration, they are unable to accept it."

A. M. MANTELL (Secretary).

Photographic Society of Great Britain.

To Captain A. M. Mantell.

Dear Sir,—I thank you for your letter of yesterday, and share the regret of the Committee at the non-acceptance of the proposal of a Scholarship. If I may be permitted to express an opinion on the matter, I feel that there is a great want of due regard to the interests of photography, when a free and absolutely unfettered gift of £100 per annum to benefit the art-science cannot find a recipient.

JOHN HOWSON.

* * * *

YELLOW CALICO v. RUBY CLASS.

SIR,—In reply to "Calico's" letter, in which he asks "why canary-coloured glass is not used instead of the ruby," I can only give him one reason, and that is that experience has taught us that it is not safe. Ruby glass is preferable. I suppose the canary glass is too transparent, and does not filter the light sufficiently. I have heard that glass of a "cathedral green" is nearly as good as ruby, but of that I have had no experience. I hope "Calico" will allow me to persuade him to try the *yellow calico*, and afterwards communicate his ideas through the medium of the AMATEUR PHOTOGRAPHER, so that others may have the benefit of hearing another speak who has suffered, but is now happier for his—

EXPERIENCE.

* * * *

SOCIETY FOR WOOLWICH.

SIR,—For some months past a small class in photography has been held in Woolwich. It is now thought possible to establish a photographic society for Woolwich and district. May I ask you, with your usual kindness, to insert this letter, that those who would like to join may send their names and addresses to, yours faithfully, THE EDITOR OF "OUR SCHOOL MAGAZINE."

3, Adelaide Place, London Bridge, London, E.C.

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

(Continued from page 256.)

LAWS OF CHEMICAL COMBINATION.

Now that we have acquired some knowledge of the qualitative conditions which affect chemical combination, we must learn whether any *quantitative* relations are associated with the phenomena. The investigation of this question requires experimental work of a very delicate and difficult kind—of a kind therefore quite beyond the capacity of a beginner. The statements which follow must therefore be taken on trust, bearing in mind always that they are the *results of experimental work* done with the greatest care and skill. Chemical analysis of carefully purified compounds, the determination of the proportions by weight in which elements combine directly, and determinations of the quantities of different compounds which can be obtained from a given weight of one of their constituents have led to the following results, which are generally spoken of as the LAWS OF CHEMICAL COMBINATION.

(1) *The same compound always consists of the same elements united in the same proportions.*

Common salt always contains, if pure, in 100 parts, 60·61 parts of the element chlorine and 39·39 parts of the element sodium; pure silver bromide always contains in 100 parts 57·45 parts of silver and 42·55 parts of the element bromine; marble always contains in 100 parts, 40 parts of calcium, 12 parts of carbon and 48 parts of oxygen.

At first sight it might seem self-evident that the same substance should always have the same composition, but there are really no reasons *a priori* why it should be so, and as a matter of fact this constancy of composition was only definitely proved and accepted in 1806.

When the elements combine together they always unite in fixed and definite proportions by weight.

This is known as the “law of constant proportion;” it looks like a new statement, but is really only another way of putting the result which has just been explained.

It is found that one part by weight of hydrogen combines with 35·4 parts of chlorine to form hydrochloric acid, and never with any other proportion of chlorine; one part of hydrogen combines with 80 parts of bromine to form hydrobromic acid, and never with 78 parts or 82 parts or any different proportion; 35·4 parts of chlorine always combine with 107·9 parts of silver to form silver chloride, and with no more and no less. The law holds good for all the elements and all their compounds.

(2) *When the same two elements unite in more than one proportion, the higher proportions are always simple multiples of the lowest.*

This is the “law of multiple proportion.” Notice in the first place that it is not a contradiction of the preceding law. No matter how many different proportions there may be, they are *always definite*, and stand in a simple relation to one another. The exact meaning of the law will be better understood after careful consideration of the following examples.

There are two chlorides of mercury (compounds of mercury and chlorine), one soluble in water, the other insoluble, and they are found by analysis to have the following composition:—

	Insoluble chloride of mercury.	Soluble chloride of mercury.
Mercury ..	200 parts	200 parts.
Chlorine ..	35·4 „	70·8 „

The proportion of chlorine in one compound is exactly double that in the other.

There are two compounds of chlorine and tin, one a solid, the other a liquid; they have the composition:—

	Solid chloride of tin.	Liquid chloride of tin.
Tin ..	118	118
Chlorine ..	70·8	141·6

Here again the second proportion is just double the first. There are two compounds of chlorine and phosphorus; one is liquid, the other solid, and they have the composition—

	Liquid chloride of phosphorus.	Solid chloride of phosphorus.
Phosphorus ..	31 parts	31 parts.
Chlorine ..	106·2 „	177·0 „

Here it seems at first sight that the law does not hold good, and that there is no simple relation between 106·2 and 177·0, but examination shows that $106·2 = 35·4 \times 3$, whilst $177·0 = 35·4 \times 5$, and hence the two proportions are in the relation of 3 to 5.

The compounds of copper furnish similar examples:

	Oxides.	Chlorides.	Sulphides.
Copper	126·6 63·3	Copper 126·6 63·3	Copper 126·6 63·3
Oxygen	16·0 16·0	Chlorine 70·8 70·8	Sulphur 32·0 32·0

The proportion of copper in the one series being double that in the other.

Other compounds of tin besides the chlorides stand in a similar relation to one another.

	Black oxide.	White oxide.	Black sulphide.	Yellow sulphide.
Tin ..	118	118	118	118
Oxygen	16	32	32	64

We find, in fact, that in the majority of cases where two elements combine in more than one proportion the higher proportions are 2, 3, 4, 5, or 6 times the lowest, or the different proportions are in the relation of 2 to 3, 3 to 5, or some other simple ratio.

(3) *The proportions in which two elements combine separately with a third, have a simple relation to the proportions in which they will combine together, if such combination is possible.*

This is the “law of reciprocal proportion.” Consider carefully the following examples:—

35·4 parts of chlorine combine with 107·9 parts of silver to form silver chloride.

126·9 parts of iodine combine with 107·9 parts of silver to form silver iodide.

35·4 parts of chlorine combine with 126·9 parts of iodine to form iodine chloride.

Here the proportions in which chlorine and iodine combine separately with silver are identical with the proportions in which they will combine with one another.

16 parts of oxygen combine with 215·8 parts of silver to form silver oxide.

32 parts of sulphur combine with 215·8 parts of silver to form silver sulphide.

32 parts of oxygen combine with 32 parts of sulphur to form sulphur dioxide (the strongly smelling gas which is formed when brimstone burns).

Here we find that the proportions in which oxygen and sulphur separately unite with the same amount of silver are as 16 to 32; the proportions in which they unite together are as 32 to 32, or, in other words, as twice 16 to 32.

Lastly, a more complicated case, in which you can work out the ratios for yourself—

12 parts of carbon combine with 64 parts of sulphur.
12 parts of carbon combine with 32 parts of oxygen.
32 parts of oxygen combine with 32 parts of sulphur.
48 parts of oxygen combine with 32 parts of sulphur.

Laws of Nature.—This is the first time we have met with

natural laws, and as the meaning of the term is very generally misunderstood, it will be well to point out what a law of nature really is. A law of nature is *simply a statement of the uniform results of our experiments or observations*—uniform in the sense that *so far as we yet know* there is no exception to it. We have not yet met with combination between two elements occurring in indefinite proportions; we have not yet found two bodies which do not attract one another with a force varying directly as their masses and inversely as the square of the distance between them.*

A law of nature does not *explain* anything; it simply tells us that, according to observation and experiment, a certain thing *always* happens under certain conditions; it does not tell us *why* it happens. As soon as we know the cause of the law, it ceases to be a law, and becomes a *necessary consequence* of that cause. It is well known in physics that the illumination of a surface by a luminous point varies inversely as the square of its distance from the point, but this is not a "law of nature;" it is a *necessary consequence* of the fact that light waves from a luminous point proceed uniformly in all directions.

Mathematical axioms and self-evident truths are not laws of nature; we cannot conceive that they could be otherwise. The laws of chemical combination and the law of gravity might have been quite different; we can show no reasons *a priori* why they should be just as they are.†

A law of nature, then, is simply a statement that so far as our knowledge goes, under certain conditions certain things always happen; *why* they happen we do not yet know.

(To be continued.)

P.S.—The laws of chemical combination are very important, and they will not be understood without careful study. If any student, after an honest endeavour, fails to understand the explanation given, it would be well if he would send a precise statement of his difficulties to the Editor, in the form of a "query" addressed to me. C. H. B.

Photographic Printing Processes. No. X.

By ANDREW PRINGLE.

BROMIDE PAPER PRINTING.

WE now leave behind us the processes where we have excess of silver nitrate or organic silver salt, and the consequently visible image without development; and we enter a domain entirely new in respect of there being no excess of silver, no image visible without development, and much less of combination between silver salts and organic substances such as albumen and gelatine. In the albumen process much of the beauty of result and many of the dangers to results depend on combinations, more or less definite and understood, between silver nitrate and organic substances; but in the gelatine bromide process of printing, free silver nitrate has very brief, if any, contact with gelatine, and we may look upon the gelatine as practically an "indifferent" menstruum for holding the silver bromide on the surface of the paper. Certainly the less opportunity afforded for combination between silver nitrate and gelatine the better, and in good bromide emulsions, especially in slow emulsions, we do not expect to find any such combination. This absence of doubtful combination is a great safeguard against instability of results. I never remember to have seen a faded bromide

print, though I have many a time given bromide prints a very good chance of deteriorating in course of my experiments. On the other hand, the ordinary bromide paper gives us but little scope for variation in tone of our prints; the warm colours sometimes produced on ordinary bromide paper, as the result of special exposure and development, are never good tones, while the tones produced by very prolonged exposure on specially prepared emulsion frequently containing organic salts are very unpleasant unless the prints are "toned;" in fact, papers of this kind are made intentionally for the toning operation. Some of these very slow papers intended to be toned are very good, but we are not dealing with them at present.

A very strong point in favour of bromide paper is the fact that with it we have a great power of meeting defects in our negatives, more power than with any other process. We can make a good print from the weakest or from the densest negative by variation of exposure and development. Another point in favour of this process is that though we have not much range of good tone, still we can produce a tone not to be surpassed by any process whatever. With good bromide paper, prints can be produced from any negative, quite equal to the best platinotype print, in spite of the denials of some who have not mastered the bromide process; while with bad negatives, bromide paper prints surpass platinotype ones. At the same time I do not deny that if I had to print a batch of good negatives, I would use the platinotype process in preference to any other. I always do use platinotype when I can, and when there is no reason to do otherwise.

Another point for bromide paper is that we can with very little trouble produce enlarged or diminished prints from our negatives. Very often a slight alteration in size is desirable.

There is one very serious drawback to the bromide process, and sometimes it is a practically fatal drawback—the image is invisible until it is too late to alter or add to it; in other words, "double-printing" is very difficult. I do not say that combination printing, as of clouds over a landscape, is impossible, but it is far from easy, and never certain in contact printing; in printing by enlargement it is easier, but still not child's-play. I cannot but reproach the process of bromide printing for the too large number of prints, in albums and even in exhibitions, showing glaring white paper where we should have suggested clouds or delicate tinting.

I have often wondered why amateurs as a rule produce such poor bromide prints. The average of such could certainly not easily be mistaken for platinotype, and I do not consider a bromide print good unless it is of platinotype appearance. I need not say that I would never dream of glazing a bromide print intended as a picture, but I do say that I have several framed prints which neither I nor anyone else who has seen them can assert to be by one or the other process.

I have stated that in bromide printing we have a great amount of control over our results, and a power of making fair or even good prints from negatives practically incapable of yielding good prints by any other process. We require only to understand thoroughly what will be the effect of certain treatments in order to have this power over result at our command. The following may be taken as general rules:—

Long exposure tends to softness, or harmony; overdone, to flatness, fog.

Short exposure tends to brilliance, pluck; overdone, to hardness, want of detail, "chalk and soot."

In development: Plenty of iron in ferrous oxalate tends to good rich blacks; overdone, to harshness.

* This is the law of gravity.

† See "The Origin of the Laws of Nature," by Lord Grimthorpe.

Weak iron gives more softness; overdone gives poor or even "mealy" prints.

Bromide in minute quantities slows development, and tends to richer shadows and purer whites; overdone, produces hardness, often bad colour, and even sometimes gives a nasty "grain."

With quinol developer the latitude is great, the chief point being to give plenty of exposure but to make development slow. In such a case we can almost do as we like with our print, but over-exposure and rapid development give ugly colour to the details.

If we have to print a very dense negative full of violent contrasts, our best course will clearly be to give a very long exposure, and develop with ferrous oxalate weak in iron. *Per contra*, a "ghostly" negative may be made to yield even a hard print by very short exposure and brisk development with a large proportion of iron to oxalate, and the bromide may be above the normal in quantity. With any negative of average quality we can make two prints wholly dissimilar in quality yet both good of their kind.

The question now evidently is, what is the "normal" developer? The two developers which I would recommend for bromide printing are ferrous oxalate and quinol with carbonates. Pyro can be used, also quinol with caustic, also eikonogen; but I do not like them so well, nor consider them so safe as the two following.

For ferrous oxalate we have to keep two "saturated" solutions, one of potassium oxalate, one of ferrous sulphate. It is better not to heat the solutions to cause saturation, but to keep them in large bottles at about 60° Fahr., a quantity of the salt always being visible undissolved at bottom of the solution. But the solutions should be stirred from time to time, always before filtering off a quantity for use. The iron should be kept decidedly acid, each pint of the solution should have at least ten minims of sulphuric acid, and the oxalate should have a trace of acid, which may be acetic or oxalic. If the solutions are too acid, development will be slow, but probably the prints will be clear. I do not like to keep iron very long in solution; a month is perhaps the longest time permissible.

A Normal Developer may be put down as—

Potass. oxalate solution	..	..	6 drms.
Iron solution	..	..	1 dr.
Bromide	..	..	$\frac{1}{2}$ gr.

A strong developer would be 1 of iron to 4 of oxalate. A weak developer, 1 of iron to 10 of oxalate. Water may be used to weaken any developer, but I do not recommend that system. Half a grain of bromide per ounce of developer is always to be recommended. I do not as a rule go beyond 1 grain of bromide per ounce, for reasons above given.

Quinol or Hydroquinone Developer—

(A) Sulphite of soda	..	..	240 grs.
Water	..	..	10 ozs.
Dissolve, then add Quinol	..	..	80 grs.

A few grains of citric acid may be added, but I do not find it necessary, if the solution is not to be kept over a week.

(B) Carbonate of soda, saturated solution at 60° Fahr.
The Developer—

(A)	..	..	..	..	2 drms.
(B)	..	..	..	..	2 "
Water, to	..	..	..	..	1 oz.

In certain cases a caustic alkali may be used instead of or in addition to the carbonate, but I prefer the carbonate alone. With this developer if the exposure has been up to a certain mark and not enormously beyond it, the image comes up gradually, slowly, and steadily, and all we have to do is to stop it at the proper moment.

Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

ACCESSORY APPLIANCES.

(Continued from page 257.)

Focussing Eye-piece.—This is a small magnifying glass usually made of two plano-convex lenses so mounted that the distance between them can be readily adjusted to suit individual peculiarities of eyesight. By the aid of a focussing glass of this description the details of the image on the ground-glass are considerably magnified, and hence their proper degree of sharpness can be more correctly regulated. There are several forms of magnifying glasses suitable for this purpose, but those in which the adjustment is made by one part of the tube working into the other with a screwing attachment are generally considered preferable to those in which the two parts simply draw apart after the manner of a telescope, for in the latter form the precise adjustment required is not so readily obtained or secured.

Under certain circumstances where the utmost possible sharpness of image is essential, the aid of a focussing eye-piece is invaluable; but the operator should train himself to be able to readily obtain the correct focus under ordinary conditions without having to resort to the use of any instrument for giving extraneous assistance to his eyes.

Spirit Level.—This small implement for aiding the photographer to adjust his camera so that the lines on the ground-glass are made horizontal or parallel to the plane of the horizon, is frequently a valuable adjunct to his kit. There are many patterns of levels suitable for the purpose, but the form of camera used should be a guide to the selection of the article. In some makes of cameras the baseboard carries the bellows parallel, and in one of this description a small level can be sunk therein which is easily regulated; in others the level would have to be situated on the very top of the camera to be effective, and then it would only be an exceptionally tall man that, under ordinary circumstances, could see it. Probably the best all-round form is the small spirit level made for placing on the side of the camera, wherein the bubble can be seen from either side. But individual requirements can easily be satisfied by the dealers, for, as before said, the designs are numerous.

Although this little instrument may now and again be useful, yet it is never an absolutely necessary article to possess if the eyesight is fairly good and can discern any want of correctness in the lines formed on the ground-glass. By using the frame of the focussing screen as a guide, or by even having it divided by lines as before recommended, it is always easy to recognise the fact of the camera being off the correct level, and to give it the necessary adjustment. If, however, the photographer has exceptionally defective sight, a sure guide for enabling him to level his camera, whether in the form of a spirit level or a plumb line, should be looked upon as an indispensable adjunct, for otherwise he will run some risk of giving his pictures false lines, which, in the event of buildings being seen therein, will make the result of his perhaps otherwise skilful labour absolutely worthless.

The Shutter.—The article known by this name to photographers is employed for the purpose of giving the sensitive plate the correct exposure, more especially under circumstances where the action of covering or uncovering the lens has to be performed in such a rapid manner that the hand is unable to uncap, completely uncover, and recap the lens in the fractional division of time the subject necessitates. A shutter therefore becomes an indispensable article for the

photographer to possess if at any time he desires to photograph moving objects, or in the event of his having to employ excessively sensitive plates for the purpose of securing fleeting effects. It is only the most expert operators that can without the assistance of a shutter give an exposure of less than a second in the ordinary way, when the requisite care is exercised to avoid shaking the camera by the jerking action such quick manipulations require. Some people have particularly unsteady hands, and in the event of any one afflicted in this way becoming a photographer, a shutter of some sort or another should invariably be employed, for obvious reasons.

Of late years, since dry plates of extreme sensitiveness have been placed at the service of photographers, the literature of the art-science has been deluged with articles on shutters and kindred subjects, and so many opinions have been expressed upon the best form of mechanism the instrument should possess and the speed at which it should work to be effective, that among this diversity of advice the beginner is apt to get bewildered or driven to purchase an article quite unsuitable for his requirements. Even in the event of his having had some experience of the subject, and formed opinions of his own thereon, he will find that the vendors of photographic appliances have so many different "patent articles" for sale in which his ideas are more or less embodied, that he has still some difficulty in making up his mind upon the question, to which photographers are apt to attach an undue importance, which make of shutter is the best to choose?

Some shutters are made to fit on the hood in front of the lens, others in the diaphragm slit between the lenses, and others at the back of the lens. There are some shutters in which the speed admits of regulation, others that have only one action. Some shutters are merely modifications of the ordinary drop, others are more complicated, having an action known as the go and return, which means that the exposing part of the apparatus has to rise and fall to accomplish its work. In fact, as before said, the diversity of forms becomes bewildering, and to enter here upon a minute description of their various attributes and qualifications would lead us beyond the confines of the object these articles have in view.

A shutter, to be a really useful instrument, should have the following features. Whatever its action may be, at no point of its working should it communicate any jar to the camera. Many shutters, otherwise cleverly designed, fail on this one test. Many of the go-and-return pattern have two points at which they communicate a perceptible shake to the lens; one when it is fully uncovered, and the other when the shutter closes. Of course, the least objectionable is the jar that occurs after the lens has been covered, but for many reasons this shaking of the apparatus, although it may not affect the plate when being exposed, is an undesirable feature for a shutter to possess. A good test for this point is to place a tumbler of water on the camera, and after it is perfectly at rest to release the shutter; any movement communicated to the camera can be at once discerned by watching the effect produced upon the water.

The release of the shutter should be that known as the "pneumatic," which consists of a hollow india-rubber ball, attached to a tube of the same material fastened to a small metal piston. By the pressure of the ball the air is forced through the pipe into the piston, and a small rod therein is moved so as to liberate the driving action of the shutter. Shutters having a release whose working necessitates pressing a catch with one finger are not to be recommended, because there always exists the possibility of a shake being given to the camera by the hand.

The action of the shutter should be made in such a way

that the point at which it admits the maximum amount of light should remain uncovered during the longest possible subdivision of the time for which the exposure is regulated. That is to say, theoretically speaking, it should open and close from the centre. One working on the system of the parallel rulers, that is, opening from the centre right across the lens, and closing again by the reverse action, is, no doubt, as far as the manner in which the exposure is made, as good an instrument as can be procured, for the light is admitted at the centre of the lens across its full width, during the whole of the exposure. In ordinary practice, however, shutters made on the principle of the ordinary drop, or in which a circular disc, out of which at one part an aperture has been cut, is made to revolve, so that during a fraction of time the lens is completely uncovered, are all effective instruments.

(To be continued.)

Birmingham Photographic Society.

PRESENTATION OF THE CHALLENGE CUP.

THE members of the Birmingham Photographic Society dined together at the Colonnade Hotel, New Street, on Monday evening, April 21st, to celebrate the success of the Society in carrying off the National Challenge Cup offered by the Crystal Palace Company for competition among the photographic societies of the United Kingdom.

About fifty members were present at the dinner, the chair being taken by the President of the Society, J. B. Stone, Esq., J.P., F.L.S., F.G.S., etc., who was supported by the ex-President, Dr. Hill-Norris, Messrs. Jerome Harrison, and E. H. Jacques (Vice-Presidents), J. H. Pickard and A. J. Leason (Hon. Secretaries), and the leading members of the Society. Captain Henshaw Russell, with Messrs. Wollaston, Peasgood, and Brooks, came down from London to represent the Crystal Palace Company, and to present the Cup.

We may say that the object for competition is a large and very handsome sterling silver cup of considerable value. The upper part lifts off, and is provided with handles to serve as a "loving cup," in which capacity it circulated among the company during the evening.

After the usual loyal toasts, the President proposed the "Crystal Palace Company," the donors of the Cup. He dwelt on what he called the poetry of photography, which, he pointed out, arose not only from the love of the beautiful, but from the associations which clustered round the subjects of the photographer's art. Dealing with the question of the proposed photographic survey of Warwickshire, Mr. Stone said that it should be considered not as hard, dry, matter-of-fact business, but as a matter of sentiment. What should inspire every one who undertook a share of that work was love of the persons and places they knew, the love of those associations which made their life what it was, the pleasure and sunshine and happiness which they and their families and their friends enjoyed. Of all these things they wanted a permanent record; they wanted to stop the fleeting events of the moment, and treasure them as long as they lived, and hand them down for the advantage and the pleasure of those who came after them. To those who entertained any doubt as to the success of the scheme he would say, "You have never tried it," and that there was a possibility of its succeeding if the right men were appointed as the survey council.

Captain Henshaw Russell replied, and congratulated the members of the Birmingham Society on having won the Cup in competition with photographers of the United Kingdom. He had the more pleasure in congratulating them because their Society consisted mainly of amateurs, and had won the Cup against the competition of professionals. He hoped the Birmingham Society or a similar one would win it next year, for he was sure that the donors would prefer to see it become the property of amateurs.

Dr. Hill-Norris proposed "The National Photographic Exhibition," and referring to the supposed discovery of colour photography, expressed disbelief in it, but said that he was not without hope that the dream would some day be realised. He believed,

however, that the discovery was more likely to be made by some original mind rather than by means of ordinary scientific investigation. He was one of those who thought that the order of things was so related to the instincts within us that the very instinctive want of a thing was almost to be taken as a proof of possibility.

The toast was replied to by Mr. Wollaston, who stated that the idea of a National Challenge Cup had first been suggested to him in Birmingham by Mr. Jerome Harrison. The judges were wholly unfettered in their decision; they were well-known and honourable men; and from his own knowledge of every incident he could say that the win of the Birmingham Society was decisive and well deserved.

Mr. Peasgood also responded, the latter gentleman concluding by proposing "The Birmingham Photographic Society," coupled with the name of Mr. W. Jerome Harrison.

Mr. Harrison traced the history of the Society from the time when half-a-dozen friends met in a small room in Paradise Street in 1885. They soon secured (by the kindness of the School Board) better accommodation at the Technical Schools in Bridge Street; but increasing numbers and social needs forced a removal to the Grand Hotel (with an increased subscription), but the re-construction of that building, which was now in progress, had compelled another move to their present quarters in the building in which they were now met together, and in which they had secured comfortable rooms, with a small dark-room adjoining. The existing Society, Mr. Harrison remarked, had been very fortunate in its officers. In their first President, Dr. Hill-Norris, they had a man whose name was a tower of strength in the photographic world, and Mr. Stone (whose name was known and respected throughout the midlands) was a worthy successor. Their Secretary, Mr. J. H. Pickard, had been indefatigable and fearless in the cause of the Society. By fairly and squarely winning the National Challenge Cup, the Birmingham Photographic Society had reached a high position in the photographic world. They had sent into the competition the largest number of pictures, by the largest number of exhibitors; these exhibitors were, with *only one exception, amateurs*; and the work exhibited was *all new work*. They had won the Cup, and they meant to try hard to keep it. But if another year they were unsuccessful, he could assure the representatives of the Crystal Palace Company that there should be no complaints on their part, and that they would accept defeat with the same cheerfulness that they displayed after victory. As to the photographic survey of Warwickshire, Mr. Harrison thought that it was a work which it was the plain and direct duty of the Birmingham Photographic Society to organise and aid in carrying out. Already a similar work had been commenced elsewhere by ten or a dozen societies, and in no case had any other society thought of delegating to a new organisation a task which it ought to be the highest ambition of its members to carry out successfully. Still, if those with more influence than he possessed believed that the photographic survey of North Warwickshire could be better carried out independently of the Birmingham Society, he should be only too pleased to co-operate with them. But if so, let the movement be at once inaugurated—the photographic season is upon us, and there is not a day to spare—the new society formed, and the work begun.

Mr. E. H. Jacques proposed "The Visitors," which was responded to by Mr. Brooks, and Mr. C. F. Marston (Hon. Secretary of the Vesey Club).

During the evening a musical entertainment was given, and a clever conjuring performance.

On the next evening, Tuesday, April 22nd, a very large audience of the members and their friends assembled in the Temperance Hall, Temple Street, and were entertained by Messrs. Brooks and Peasgood with an exhibition of lantern slides of almost unique quality, including the famous series illustrating the Tower of London, Windsor Castle, etc. Mr. Brooks has a world-wide reputation as a manipulator of the optical lantern, and the exhibition was a treat for those who love to see that instrument scientifically manipulated, and the best results obtained.

For the coming year the Cup will find a fitting home in the magnificent Municipal Art Gallery, which Birmingham is so fortunate to possess, and where the Mayor (Mr. Clayton) and the Curator (Mr. Whitworth Wallis) have also requested that examples of the winning pictures may be sent to bear it company.

Science Notes.

LOVERS of English rural scenery—as all photographers are or should be—will welcome another volume by Mr. J. J. Hissey, on Essex, Suffolk, and Norfolk, entitled "A Tour in a Phaeton" (Bentley). The route taken is from London to Colchester and Ipswich, thence by the coast to Saxmundham, Yarmouth, and Cromer; returning to town by Bury St. Edmunds, Sudbury, and Chelmsford.

Kew Observatory is a most useful scientific institution, as is proved by the Report lately issued, and which can be obtained, post free, by forwarding three stamps to the Superintendent, G. M. Whipple, Esq., Kew Observatory, Richmond, Surrey. It appears that during the past year no fewer than 14,266 meteorological, surveying, and other scientific instruments were tested at Kew, a certificate containing full particulars as to the performance being issued with each; while 104 were rejected as not being sufficiently accurate.

Two or three years ago we suggested that Kew should undertake the testing of lenses, shutters, etc., and we still "live in hopes" that this will some day be done. The man who pays Ross or Dallmeyer from £5 to £50 apiece for his lenses will not grudge an additional half-crown for an official certificate of their performance.

As an old chess-player we have frequently felt the inconvenience of an interrupted game. There is seldom time or opportunity to record the position of the pieces, and many have been the disputes as to "who would have won that game" had it been finished. But in an instance of this kind which occurred last month we had a friend who "rose to the situation." He placed the chess-board on the floor, clamped his camera to the table top, the lens pointing downwards, and with the help of a flash-lamp secured a capital photograph of the "positions of the men." The game was subsequently finished by correspondence, and our friend won, to his great delight.

How many cameras are absolutely light-tight? Well, perhaps not many. And that is why we carefully envelop the instrument in the focussing cloth before making the exposure. Hand or detective cameras seem especially faulty in this respect, and the weak point is generally the shutter. A camera which may be quite safe in the dull light of a town fogs all the plates when used in the brilliant light of the sea-side. Let everyone test their camera in this way. Open the back of the instrument, cover that and the eyes with the focussing cloth, and let a friend burn a piece of magnesium ribbon in front of the shutter. We have just tried this test on two of the best-known and highest-priced hand-cameras of the day, and both failed lamentably, as the skilled optician who aided us can testify.

To remove glass stoppers which have become fixed in bottles, first try the plan of tapping the stopper on each side, alternately, with a piece of wood—the handle of a hammer answers best. If this fails, tie two pieces of strong inelastic string round the stopper, one on each side, fasten the strings together, and pass them over a hook in the ceiling or a strong beam. The bottle can then be jerked downwards, and a great strain put on the stopper, by which it is usually extracted.

Every photographer knows how to produce blue prints. The following directions for obtaining red, green, and violet pictures are by the well-known American worker, Mr. Estabrooke. Float ordinary writing paper (which has not been exposed to the light for a few days) for four minutes on a bath containing nitrate of uranium 2 drms., distilled water 10 drms. Dry in a dark place. Expose this paper beneath a negative for eight or ten minutes; wash in plain water for a few minutes; and immerse in a bath of ferridcyanide of potash 30 grs., water 3 ozs. In a few minutes red prints are obtained, which must then be well washed to fix them.

By immersing the red prints (without drying) in a solution of sesqui-chloride of iron 30 grs., distilled water 3 ozs., the tone changes to green; wash, and dry before the fire.

Violet prints are obtained by floating any good white paper for three or four minutes on water 2 ozs., nitrate of uranium 2 drms., chloride of gold 2 grs. Dry and expose beneath a negative for ten or fifteen minutes. Finally, wash well and dry.

Aluminium—the metal which is to displace the heavy brass for lens mountings, camera fittings, etc.—is being largely manufactured at Oldbury, near Birmingham, under the patent of the American inventor, Mr. Castner. Aluminium is the commonest of all metals, being found in 200 minerals, including granite and

clay. But hitherto it has been very difficult to extract from its ores. The Aluminium Company, whose offices are at 115, Cannon Street, London, quotes the metal at fifteen shillings per pound, which is by far the lowest price at which it has ever been sold. Owing to its extreme lightness, the purchaser gets about three times as much, in bulk, for his money, as he would in buying the same weight of brass.

For mounting large prints, the *Scientific American* states that there is nothing better than a small clothes-brush. The print is pasted on the back, laid down on the mount, covered with a sheet of thin paper, and then brushed outwards from the centre. No air-bubbles remain, and there is neither straining nor distortion.

F. G. S.

Our Contemporaries at Home and Abroad.

THE *Beacon* (Chicago), in an article on "Mechanical Printing," says, "Silver printing has served its purpose, and done more than anything else in connection with the art to bring about the great popularity which it has enjoyed during the last thirty years. It came at a time when art culture was at a low ebb, at least among the great mass of the people; and by its beauty and delicacy of detail, fascinated, where breadth and true artistic effect would have fallen flat and remained unheeded. . . . The sitter, in possession of a negative, will, on examining the results of the various mechanical processes, select that which pleases him best, or is most suitable for some special purpose, and hand it to the printer with an order for such a number of copies as he may require. It is true that the processes suitable for this kind of work are, as yet, too expensive; but those who have watched the development of mechanical printing, from Talbot's earliest efforts, through all its various stages to, say, the 'tree study' by Ives' process in the March number of the *American Journal of Photography*, or the prints in the Gutekunst souvenir noticed in our last issue, cannot doubt but that something equally good and suitably cheap is but a matter of time, and in the near future." Articles: "Lantern Slides by Wet Collodion," "The Optical Lantern," "The Lights of Other Days," "How I Paint a Portrait," "Development, Quick or Slow," "Photography, Historical Sketch," etc.

Toning with platonic chloride is, according to Frank Perrins, as easy as with the more difficult to prepare platinoous salt. "All that is necessary," he says, "is to add to a slightly acidulated solution of the platonic chloride a crystal of sodium sulphite, and brush the solution over a well-washed silver print on plain paper, to bring about the immediate displacement of the silver by the platinum."

The *Photographic Times* (New York), in an article on "The Acid Fixing Bath," says, "The acid fixing bath is a solution of hyposulphite of soda to which has been added in prescribed precautions, sulphite of soda, tartaric, citric, or some other organic acid. Doctor Eder's formula directs that to one litre of freshly-prepared hypo solution, fifty c.c.m. of acid bisulphite of soda lye (a commercial article), should be added, and it is the simplest formula thus far published. His method is fast superseding the old one of fixing in pure hyposulphite of soda solutions, for it possesses many valuable advantages. . . . With the acid fixing bath this decomposition is overcome, the solution remains clear and colourless, and therefore serviceable for almost an indefinite time. The negatives fixed therein are absolutely glass clear, and as far as can be judged by present observation, the danger of a plate frilling in the hypo is reduced to a minimum. Owing to its great permanency, the acid bath is also very much cheaper than the neutral one. For reducing negatives so fixed the following bath should be used:—

Water	7 ozs.
Potass. ferric oxalate	2½ drms.
Crystallised neut. sulphite of soda	2 "
Powdered oxalic acid	from 30 to 40 grs.
Hyposulphite of soda	1½ ozs.

The *British Journal of Photography* says, "Now that the evanescence of photographs is once more to the fore, it may be

well to direct attention to the fact that a process which is beyond reproach may suffer, indeed is suffering, in reputation from the downright carelessness of its workers. This somewhat strong remark is called forth from the circumstances that we have recently seen several examples—and from different sources—of platinotypes that have become decidedly yellow in the lights within a very short time, simply from the iron not being removed after the development of the image. . . . It is quite possible by any photographic process, notwithstanding that it may be a permanent one, to produce results which will undergo a marked alteration within a brief period. Take, for example, the carbon process, which has a very high reputation for permanency. If the pigments employed for the tissue are of a fugitive character—and some are—the pictures will undergo a marked change by exposure to light; so they will if they are transferred to those kinds of paper which become discoloured by the light's action. We have seen yellowness in carbon pictures arising from a trace of the chromium salts being carelessly left in the paper through insufficient washing. Again, with bromide paper, unless a moderate amount of care is bestowed on the clearing and fixing, the pictures are liable to acquire a yellow tint as time progresses." Articles: "Wanted a Word," "Vignetting Enlargements," "The Shapes of Photographic Plates," "Gelatine and the Latent Photographic Image," "Limelight and Pressure," "Selecting a Lens," "The Mathematical Calculation of Exposures, and a New Exposure Meter," "The Latent Photographic Image," "Summer Novelties in Apparatus," etc.

The *Photographic News*, in an article on "Photographic Composition," says, "Let the photographer who is about to take a group form some clearly defined idea what his work is intended to express before he attempts to arrange its elements. This is such a plain, matter-of-fact piece of advice that its insertion would seem to be unnecessary, and so unjustifiable, were it not for the notorious fact that so many photographers sin against this, the first of the laws of composition. It were, indeed, all one for a man to attempt to paint something which he has not previously drawn, or to build a house without a scaffold. The artist must, in the first place, make his work clear to his own mind, and then it may afford intelligible interest to the minds of others. Having conceived his idea, he will arrange his characters to correspond with it. The usual plan is the reverse. He shuffles together his personages at haphazard, and if the group should turn out to be something in the nature of a circle or pyramid, the two figures chiefly affected by the ordinary photographer, he will therewith rest content." Articles: "A Photographic Exhibition in the City of London," "A Photographic Untruth," "Selecting Lens," "On Photography by the Electric Light," "Colour Sensation," "Photographic Apparatus," "The Latent Photographic Image," "Limitations in the Treatment of Subjects of Focus," etc.

The *American Amateur Photographer* gives the following methods of making and toning uranium prints:—

Brush well-sized paper with the following:

Nitrate of uranium	1 part.
Water	16 parts.

Dry in the dark. Expose under the negative until a faint image is visible. To develop the print, float on one of the following solutions according to the tone desired.

For black tones, nitrate of silver	1 part.
Water	20 parts.
For reddish-brown tones, ferri-cyanide of potassium	1 part.
Water	36 parts.

When the print is sufficiently developed it is washed in water for a short time.

For violet tones, chloride of gold	1 part.
Water	240 parts.

Articles: "Modified Collodion Emulsion," "Camera Club," "Club Sketches," "Photography as an Aid to Artists." It also gives the following: "Mr. J. Werge recommends staining a weak negative a ruddy colour by immersing it in a solution of bichromate of potash, which stains the plate all over, and gives neither fog nor local obscuration. We have often intensified negatives in a solution of yellow aniline, with uniformly good results. If a deeper tinge is desired than is at first obtained, it is an easy matter to increase the strength of the solutions. The same result is obtained by fixing and washing a number of light-struck plates and then staining them of different intensities. These screens

are to be placed over the negative after it is in the printing-frame."

Photography, in an article on "The Fading of Silver Prints," says, "But the permanency of silver prints on albumenised paper has a certain amount of claim upon us historically, because it was for a long period the only recognised printing method. The fine examples shown by Mr. J. Spiller at the Photographic Society a few weeks ago, were particularly interesting, for not one in the portfolio showed signs of deterioration. But Mr. Spiller himself, who had made them, confessed that he could not make a silver print and guarantee that it should be unchanged after two years' time. A silver print that is more than twenty years old and shows no sign of decay, is valued as a curiosity because the impression remains; but we venture to assert that in a hundred years' time, platinum prints made now will be valued solely on account of the subject, like an old engraving. So far as the permanency of silver prints affects the practice of to-day, it is purely a trade question. Among those more especially concerned it may well be asked whether it would not tend to the dignity of professional photography if the fact was much more conspicuously announced that permanent prints might be had, but that if silver prints were preferred there could be no guarantee that they would last more than a year or so." Articles: "Medical Photography," "The Glamorganshire Survey," "A Model Dry Plate Works," "A City Photographic Excursion," "The Liverpool 1891 Exhibition," etc.

The *American Lithographer and Photographer* (New York), in an article on "Chromo-Photography in the Printing Press," says, "The fact of producing a coloured illustration by means of selecting portions of a negative for printing each with a separate tint or in some parts with several tints overlaid on the same part is, of course, not new; but when any particular striking production is seen, there are naturally enough inquiries as to the means by which it has been accomplished, and as in the subject of the present notice the process is one which is scarcely known in this country, some details of it may be interesting to our readers. We gather from the annual containing the illustration, and from other sources, that the plates employed by Messrs. Wezel and Naumann, of Leipzig, are prepared as follows: Lithographic stone is partly dissolved and partly reduced to a pulp by digestion in hydrochloric and sulphuric acids. To this pulp is added a mixture of solution of asphaltum and resin and a small quantity of oil. By this means a mixture of fatty or resinous salts of lime and sulphate of lime is formed. After evaporating the excess of acid a dilute solution of soda is added, and warm zinc plates are covered with a fine spray of the mixture. The plate thus coated with a film of artificial litho-stone, is afterwards treated in the same way as an ordinary lithographic stone, except that in place of nitric or hydrochloric acid, phosphoric acid mixed with dilute gum arabic is employed. Plates thus prepared have yielded as many as 6,000 impressions." Articles: "Photo-Chemical Printing," "Photography in Germany," "Photographs in Colours," etc.

L'Amateur Photographie contains articles on "Photography and its Industrial Applications," "Experimental Study of the Phenomena known in Photography under the name of Halo," "New Magnesium Light," etc.

Revue Suisse de Photographie (Geneva) contains phototypic reproductions of a picture, "Ellena," exhibited at the last Municipal Art Exhibition in Geneva, showing the different effect in the representation of colours in ordinary and isochromatic plates. The difference in this particular case is remarkable, and no one can doubt that a far better and finer idea of the original picture is given by the isochromatic plate than by the ordinary. Articles: "Experimental Analysis of the Phenomena of Halo," "Photography at the Paris International Exhibition," "How to Avoid the Dangers of Magnesium Flash Powder," "Photography for Beginners," etc.

BRADFORD PHOT. SOC:—The usual monthly meeting of the above Society was held on the 15th inst. Mr. W. Leach read a paper on "Enlarging and Reducing." Specimen enlargements to 24 by 20 were shown, and after the paper numerous lantern slides reduced from whole-plate negatives by Mr. Leach and Mr. Scott were shown on the screen by the Society's lantern. A specially light 12 by 10 camera, made for the President, was shown, the weight of the camera being under 9 lbs. Messrs. F. Pickles and W. Wood were elected members of the Society.

Exhibitions.

NEWCASTLE PHOTOGRAPHIC EXHIBITION.

THE AWARDS.

Classes (A to Q) open to Professionals and Amateurs.

THE Gold Medal for the best three pictures in the exhibition is awarded to J. Lafayette, of Dublin, who also takes a silver medal in Class D (Protraiture)—the following being the prize-taking pictures out of twenty-three exhibits by this contributor:—Portrait of Mrs. Langtry (211), portrait of Miss Moody (213), portrait of a lady and child (215). Mr. Lafayette thus secures the highest award of the exhibition. The gold medal is awarded by the Association for the best three pictures irrespective of class. The silver medal, together with a bronze medal, is presented by Mr. J. P. Gibson, of Hexham, for a series of three portraits. The winner of the bronze medal is Mr. W. J. Byrne, Richmond, Surrey, with No. 177—three portraits "direct and untouched;" 179, six "At Home" panels representing the present Emperor of Germany at Osborne; and 180, ten "At Home" panels representing various people, taken by daylight at the sitters' residence.

The following is a list of prize-winners according to classification, excepting, of course, Class D, which has been dealt with in the preceding paragraph:—

Class A (Landscape—above whole-plate).—Silver medal, Green Brothers, Grasmere. Nos. 44, 45, 46. Views of Stybarrow Crag, Ulleswater; Blea Tarn, Langdale; and Derwentwater and Skiddaw, from above Lodore. Bronze medal, Mr. J. P. Gibson, Hexham, with "The Thaw" (18), "Autumn Haze" (21), and "September" (22).

Class B (Landscape—whole-plate and under).—Silver medal, Mr. J. P. Gibson, Hexham, with three out of a remarkable exhibit of forty-seven frames—viz., "Out for a Holiday" (65), "The Banks of Tyne" (70), and "A December Morning" (77). Bronze medal, J. E. Austin, West Court, Detling, Maidstone, with "The Last of the Ebb" (120), "Listening to the Bells" (121), and "By the Tow Path" (122). Extra bronze medal, J. G. Bullock, with "Moosehead Lake, from Kinco" (132), "On the Wawasett" (133), and "Birch Trees at Kinco" (134). Medals presented by Mr. Auty, Tynemouth.

Class C (Silver medal for best landscape printed on gelatino-bromide paper, direct or enlarged—both original, negative, and print to be the work of the exhibitor—presented by J. B. Payne, Newcastle).—Awarded to Messrs. Auty and Ruddock, Tynemouth, for view on the Irthing (175).

Class E (Best portrait printed on gelatino-bromide paper, direct or enlarged. Silver medal, presented by J. Wilson Swan, M.A., Newcastle).—Awarded to Messrs. Auty and Ruddock, Tynemouth, for "Miss Maudlin" (284).

Class F (Architecture, interior or exterior, silver medal for series of three).—Richard Keene, All Saints', Derby, for frame of six interiors of Derbyshire churches (318). Bronze medal, W. Parry, South Shields, studies of St. George's, Jesmond, Nos. 329, 330, 331.

Class G (Series of three instantaneous pictures).—In this class a silver and bronze medal were offered, but the judges award a silver medal each to W. Parry, of Shields, and Lyd. Sawyer, Newcastle, whose winning exhibits are considered equal. Mr. Parry's pictures are numbered 358, 359, and 360; Mr. Sawyer's, 370, 372, and 376.

Class H (Genre. An extra silver and an extra bronze medal are awarded in this class).—Silver medal awarded to F. Whaley, Doncaster, for "Your Turn Next, Sir!" (389). Extra silver medal—R. S. Redfield, Philadelphia, U.S.A., for "Victuals and Drink" (463). Bronze medal, W. W. Winter, Derby, for "Does Granny Like Butter?" (418). Extra bronze medal, F. M. Sutcliffe, Whitby, for "Excitement" (281).

Class J (For best enlargement—any subject except portrait).—Silver medal, T. G. Whaithe, Carlisle, for a view of "Dinant Cathedral and Market Place" (500). Bronze medal, Green Brothers, Grasmere, for "Y Tryfan and Llyn Ogwen, North Wales" (489).

Class K (Cattle studies. Silver and bronze medals, presented by the Editor of *Photography*).—Silver medal, J. E. Austin, Detling, Maidstone, for "Cooling Waters." Bronze medal, Ralph W. Robinson, Redhill, Surrey, for "Suspicious" (512).

Class L (A genre competition for the best study illustrating

verse 14, Canto I., of Scott's "Lady of the Lake," for which a bronze and a silver medal were presented by the Editor of *Amateur Photography*.—There were only three entries, and the judges made no award.

Class M (Best enlargement upon Ilford bromide paper. Gold and silver medals, presented by the Britannia Works Company).—Gold medal, W. W. Fry, Tynemouth, for view of Cullercoats Bay (539). Silver medal, H. Dudley Arnott, Gorleston, Great Yarmouth, for "Main Entrance, Somerleyton Hall" (538).

Class M M (Best series of three prints on Alpha paper. Gold and silver medals presented by the Britannia Works Co.).—Gold medal, F. W. Edwards, Peckham Rye, London, for five bas-reliefs after G. Tinworth, the well-known sculptor, and a reproduction of an old engraving, "Hector Rebuking Paris" (552, 555, 558). Silver medal, J. E. Austin, Detling, Maidstone, for "Rest and Refreshment" (550), "Waiting her Turn" (551), and "Early Spring" (552).

Lantern Slide Section (judged on the screen).—Silver medal, R. S. Redfield, Philadelphia, U.S.A., for No. 662. Bronze medal, G. W. Wilson and Co., Aberdeen, for No. 659.

Class O (Series of six instantaneous slides).—Silver medal, Henry Little, Twickenham, London, for No. 681. Bronze medal, W. Parry, South Shields, for No. 683.

Class P (Series of six architectural slides).—Silver medal, G. W. Wilson and Co., Aberdeen, for No. 696. Bronze medal, Jas. A. Sinclair, Bootle, Liverpool, for No. 694.

Class Q (Best six slides on the Mawson lantern plates. Gold and silver medals, presented by Messrs. Mawson and Swan).—Gold medal, J. E. Austin, Detling, Maidstone, for No. 700. Silver medal, W. Parry, South Shields, for No. 710. Extra silver medal, Edgar G. Lee, Cullercoats, for No. 708.

Class U (Stereoscopic slides on glass. Silver and bronze medals, presented by J. Hedley Robinson, Tynemouth).—Silver medal, H. G. Ridgway, Sunderland. Bronze medal, F. Howard, Wallingford, Berks.

Classes Open to Amateurs Only.

Class R (Series of three landscapes, half-plate or under. Silver and bronze medals, presented by Mr. Alex. S. Stevenson, J.P., Tynemouth).—Silver medal, C. Court Cole, Folley Bridge, Oxford. Bronze medal, J. W. Evans, Wolverhampton.

Class S (Series of three architectural studies, interior and exterior, half-plate or under).—Silver medal, C. R. Pancoast, Waterbury, Conn., U.S.A. Bronze medal, Ernest Beck, Sheffield.

Class T (Three instantaneous pictures, half-plate or under).—Silver medal, Ernest Beck, Sheffield. Bronze medal, Martin J. Harding, Shrewsbury.

Class V (For best landscape by an amateur member of the Association. Medals presented by the proprietors of the *AMATEUR PHOTOGRAPHER*, subject to their conditions).—Silver medal, James Brown, Newcastle-on-Tyne. Bronze medal, Geo. Proud, Newcastle-on-Tyne.

The Judges were Messrs. Paul Lange, William Lang, jun., and John W. Wade.

DEVON AND CORNWALL CAMERA CLUB.—The exhibition of members' work was held in the Athenæum, Plymouth, last week, when there were a large number of pictures on show.

LEWISHAM HIGH ROAD CAMERA CLUB.—A meeting was held on the 18th inst., at 8 p.m., at the Lecture Hall, when twenty-six names were registered as members of this newly formed club. Six of those were ladies, and it was stated that a number of the gentler sex would be likely to join now that the ice had been broken by the more courageous ones. The whole evening was occupied in framing a set of fifteen rules, and in settling other matters in connection with the formation of the club. The next meeting is to be a social one, the members bringing their friends and entertaining them with a lantern-slide exhibition, the slides being the work of the members. A large increase in the numbers is expected to take place as soon as the club is better known, which is being effected by means of circulars widely distributed. It was stated as a significant fact that nearly all the members had heard of the club through the *AMATEUR PHOTOGRAPHER*. The date of the social meeting is to be announced shortly. Mr. Alfred N. Miles, the Vice-President, occupied the chair. Communications of all kinds should be addressed to the Hon. Secretary, Mr. B. Davidson, 40, Sandbourne Road, Brockley, S.E.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

THE subject for discussion at the meeting of the Club last week was a most interesting one, but unfortunately the result of the discussion left the question pretty much where it was before. The title of the paper, "Amateur and Professional," justified the belief that there would be a good and somewhat warm discussion of the question whether there should be any distinction made between amateurs and professionals, but, as it turned out, that point only came into the field incidentally. Upon it, however, the members present, about forty in number, expressed an opinion that there should be no distinction made. The chair was occupied by Mr. Stroh, but unfortunately Mr. Adcock, who had prepared the paper, was confined to his room by illness, and so the Hon. Secretary, Mr. Davison, read the paper for him. Mr. Adcock pointed out that his theme for the evening was a difficult one, and affected a large number of persons. He thought they might congratulate themselves, however, upon not having to legislate, but only to discuss, and look at the different sides of the subject. He believed that the large number of amateurs now practising photography as a pastime had led the general public to imagine that enormous profits were realised by the professional. The amateurs now did so much work that there was little required of the trader. A professional, if he wished to create a large business, required good premises in crowded thoroughfares, which could not be obtained at a low rent. He also required a good manager, a good workman, two girls to retouch, two to spot, two to tone, and an attendant. That was the ordinary staff of a business, and it incurred great expense. The complaint of the trader was that employment had become so irregular and so diminished, as to make it difficult to keep separate people for special work. His sympathies in that matter were with the trader. He was confident that the trader's difficulties increased year by year, whilst his business annually diminished.

The whole subject of "amateur and professional" bristled with difficulties. If they took the case of a man whose means were small and family large—call him what they like, small trader or ought else—and that man, having time at his disposal, did some photography to increase his income, it would not, he thought, call forth complaint from the trader, because, no doubt, he would be compelled to force down his price, and also have difficulty in finding buyers. With regard to giving photographs to bazaars, he thought that the amateur should take the negative and then hand it over to the trader to print, the organisers of the bazaar paying the printing fee. He advocated amateurs and their families having their photographs taken by professionals. If amateurs took a negative of their friends, they should hand over that negative to a trader to print, thereby enabling the professional to print the photographs, and the sitter to defray that expense. Mr. Adcock had always been treated kindly by the trader, whom he highly respected. Having again urged amateurs not to damage the professional, he advised them to adopt the golden rule, "Do to others as we would have them do to us."

Mr. Pringle commenced the discussion, and said he did not think that the unpleasantness now smouldering between the two classes would ever break out into a flame. The fact was that photography could now be started on so small a capital, that very many people who had mistaken their profession had adopted it as a business. It was not right, however, that amateurs should do them any harm, but they sometimes did harm to those small traders who were unable to keep special people for retouching, and that sort of thing. Bazaars, too, he considered a great mistake, and capable of doing a great deal of harm. He concluded with a sentiment with which all genuine amateurs will cordially agree, when he expressed the hope that amateurs would do what they could to make the harm they did to small traders as little as possible. Mr. Davison then read the letter by Capt. Feilden (*AMATEUR PHOTOGRAPHER*, February 28th) with regard to the distinction between amateurs and professionals, and Mr. Webber expressed the belief that the majority of amateurs practised the art for pleasure purely, and so long as they abided by that principle there would not be much trouble between the two parties.

Dr. Patterson thought that if the work of the amateur was better than that of the small trader, the latter should be out of the way. It was a great pity that the amateur should have to stay his course for those small traders who had mistaken their calling. Mr. Davison, referring to the distinction of amateur and professional at exhibitions, expressed the opinion that there should be no difference made. If a man took up a business which could be so easily practised by others without training, he must stand the racket. The one point which he would like to emphasise was that there was absolutely no way of drawing a fair distinction between amateurs and professionals at exhibitions. The aim was that the best and most artistic work should be exhibited and gain the highest reward. He suggested that a vote should be taken as to whether the meeting was in favour of a distinction being made between amateur and professional.

Rev. F. C. Lambert objected to any difference being made between amateurs and professionals, especially at exhibitions. He thought that all work at exhibitions should be performed by the exhibitor, and that firm work should be entirely dispensed with. When firm work was admitted into exhibitions, the number of hands employed on a picture should be stated.

Mr. Tomlinson was of opinion that the best results, as a rule, were secured by the employment of two or three hands. He wished, therefore, to know whether the abolition of firm work would not lead to more work being done by one man.

Mr. Pringle said on second thoughts he came to the conclusion that all they wanted was to arrive at the greatest good that could be done to photography. To that end he would make no distinction between many-handed work and single-handed work.

The Chairman put Mr. Davison's resolution to the meeting, and it was carried unanimously.

In returning thanks to Mr. Adcock for his paper, the Chairman observed that he did not think that photography would have been at its present stage of perfection had it not been for the work of the amateur.

On Thursday, May 1st, Capt. Abney will read a paper.

Notes from the Liverpool Centre.

(From our District Editor.)

For the past few days all the talk in photographic circles here has been of the Newcastle Show, and, consequently, general photographic matters have had to take second place. The Liverpool gentlemen—and I have spoken to several—who have already visited the Tyneside exhibition are loud in praise of the exhibits and general arrangements. Regarding the Liverpool section, the utmost satisfaction is expressed with the display. The President of the Liverpool Association has come back with excellent impressions of the show as a whole, and all appertaining thereto. A few of the arrangements, however, may be improved upon in Liverpool next March.

Last Saturday another contingent of the Liverpool Society "excursioned" to Raby, and although the weather was somewhat unfavourable, a few good studies were obtained. On Saturday, May 3rd, it is intended to have an excursion to Ledsham and Burton—two picturesque resorts a few miles out of Birkenhead, on the Cheshire side. These half-day jaunts are largely patronised, and of considerable mutual help, especially to beginners in the art-science. Most of the societies in this meridian contemplate a series of excursions during the summer months, and the season, it is expected, will prove busier than ever before.

We have a statue of the late Earl of Beaconsfield in front of our St. George's Hall, and on every recurring Primrose Day the said statue is profusely wreathed and garlanded with the pretty yellow flower, placed there by Primrose habitations, dames, knights, and other admirers of the late great Conservative leader. Thousands of persons congregate in the vicinity and keep things lively all round. Mr. W. Tomkinson, Vice-President of the Liverpool Association, who, by the way, is an enthusiast at snap shots, got an admirable picture of the decorated statue last Saturday. Mr. Tomkinson is to open the Belfast Exhibition next Monday.

At Thursday's ordinary meeting at the Liverpool Rooms, Mr. J. A. Forrest is to read a paper on "The most effective Means

of preventing Light getting to the Sensitive Plate whilst it is in course of Development in the Dark-room." Afterwards Mr. Forrest is to explain "the cause of a peculiar fog that comes over lantern slide covering glass." The subject has lately created inquiry and discussion in the photographic journals, and Mr. Forrest's remarks are anticipated with much interest. In addition to the foregoing, Mr. F. Vaughan will read a paper, with demonstrations, on "Photography as applied to Letterpress Printing." The subject for practical demonstration next Wednesday is "The Printing and Toning of Silver Paper," including Obernetter and Aristotype papers. Messrs. J. MacDonald Bell and H. Wilkinson are the demonstrators.

Mr. Harry Tolley's (Notts) pictures have been sent from Liverpool to Belfast. The "Boston Slides," have not come to hand yet, though they should have been here weeks ago. The Boston Society advised their despatch from the "hub of the universe," in the early part of the year.

Formby Photographic Society.—I ran out to Formby, a village fifteen or sixteen miles from Liverpool, on Monday night to attend the ordinary meeting of the Formby Society. I found, however, that the meeting had been declared "off." But not liking the idea of a wild-goose chase, I hunted up the President of the society, Mr. R. E. Maclean, and had a pretty long chat with him. During the past few months the society has lost some of its members through removals, but the future outlook is reassuring. The membership of the society is at present between twenty and thirty, but they are not all active workers. A meeting was held last Easter Monday, and further outdoor afternoons are being arranged. The open lantern evenings are largely attended, the head-quarters of the society being at Victoria, Freshfield, a mile and a half from Formby, but only three minutes walk from Freshfield station (Lancashire and Yorkshire Railway). The social element in the society is considerable, but a few good workers are included among the members. Mr. Maclean intends "doing" Cornwall this year for a vacation.

Birkenhead Photographic Society.—Mr. W. A. Brown's paper on the "Chemistry of Photography" was most instructive and of great benefit to those who heard it. The accompanying practical experiments were also very useful, and have opened up important new ground for members. Mr. Brown, though still young, is an ardent chemist, and has prosecuted his researches in this branch of science deeply and successfully. It is felt that such papers as his are of inestimable value to photographers.

The annual outdoor competition of the Birkenhead Society, which takes place at Bidston on the last day in May, is looked forward to with much interest, and promises well. Mr. C. B. Reader, the able young Secretary of the society, means the competition to "hum," as an American member expresses it. I hear that the Wallasey Society is largely interested in the result.

Mr. Fred Evans and Company are far advanced with the preliminaries for the Convention of Photographic Societies of Great Britain, to be held at Chester in the last week of June. Many good things will be crowded into the week's procedure, and success seems fully assured. The societies in this district, including Liverpool, Birkenhead, Liverpool University College, Wallasey, Walton, etc., I am told, will all take part in the big gathering.

LEYTONSTONE AND EPPING FOREST PHOT. SOC.—The first monthly meeting of this Society was held on the 16th inst. Mr. J. H. Phillips presided. The Secretary made a statement with regard to the prospects of the Society, and invited all gentlemen present who had not become members to do so at once. Mr. A. Whitman then read an interesting and practical paper on "Chloride of Silver Emulsion Papers," and illustrated his remarks by demonstrating the processes described. Mr. J. W. Spurgeon, the Hon. Secretary, then read a paper on "Artistic Photography," which was attentively listened to and much appreciated. After some conversation and inspection of the Society's dark-room, the meeting broke up. The Secretary announced that the next meeting would be held on Wednesday, May 7th, at 8 o'clock, when Mr. C. E. Webber would read a paper on the "Platinotype and Carbon Processes," practically demonstrating both. Visitors would be welcome with a view to membership.

Apparatus.*

THE "FERNANDE" BURNISHER.

THIS burnisher is strongly made and finished in the best style, with the result that the work it does is also good. The two rollers are so made that they will not scratch the print, and the arrangement for heating is very effective. The bottom roller is hollow, and to heat with gas the brass burner is inserted in the hollow roller, and fastened with the nut outside the chimney; an india-rubber pipe is then put on the tap; the gas-tap to be kept closed till ready. In the cup (rim) on the chimney a little spirit is poured and lit before lighting the gas, so as to draw the cold air out of the hollow roller. Dip the wick of the lighting-rod in the spirit, turn on the gas, and insert the lighting-rod underneath the brass-burner, as far as possible, and withdraw it slowly, so as to light all along the burner. In about four or five minutes the roller will be sufficiently hot.

It can also be heated by a spirit apparatus, as shown in the cut, in which case the india-rubber tube is attached to the spirit receptacle, under which a lamp is burning. This vaporises the spirit, which is lighted at the brass burner inside the lower roller. The tension is kept up by two spiral springs, the pressure on which is regulated at each end simultaneously by pulling the chain in the proper direction. The price of the 10 inch burnisher is, for spirit, £6 10s.; for gas, £6 5s. The agent for this country is C. A. Rudowsky, 3, Guildhall Chambers, E.C.

Societies' Meetings.

EAST DULWICH AND PECKHAM PHOT. SOC.:—The first annual meeting of this Society was held at 76, Peckham Rye, on Friday, April 18th. The Secretary's report was read, and the following were elected officers for the ensuing year: President, Mr. F. W. Edwards; Vice-Presidents, Mr. Maurice Howell, M.P.S., Mr. W. Rice, Dr. Munyard. The Committee consists of Messrs. Mark Boxall, Dowell, Farmer, Dowling, Fitness, Fellows, W. F. Slater, F. Webb, and Whitby; Hon. Treasurer, H. G. Banks; Hon. Secretary, S. W. Gardner. During the evening three gentlemen were elected, and nine others nominated.

HOLBORN CAMERA CLUB.—A meeting was held on the 18th inst. under the chairmanship of Mr. E. J. Wall. Mr. H. Burns was elected a member of the Club, and Mr. F. W. Hancock was proposed for membership. The subject for the evening was "Hints to Beginners," and Mr. Brocas kindly gave the necessary information, which was of an elementary character, after which Mr. Wall made a few remarks on lenses, and said that when he started photography he had to teach himself, but that now the best thing for the tyro to do was to join a club. He also stated that after three and a-half years' work, and some thousands of experiments, a friend and himself had successfully produced a printing-out paper which could be printed by gas light with an

exposure of about 45 minutes, either matt or enamel surface and any colour desired; or by simply fixing without toning a pleasing result would be obtained.

JERSEY AM. PHOT. SOC.:—An informal meeting of this Society took place on the 16th inst., at which a paper on "Photographic Printing" was read by Mr. J. H. Burcham Rogers. After carefully describing the varieties of sensitised papers in use, the operation of printing, the thorough washing required for the acetate and borax baths, the partial washing only for other baths such as the chloride of lime, the subsequent arrest of toning by an immersion in a solution of common salt and the fixing of the print, Mr. Rogers gave an account of the Godstone automatic print-washer, which he highly prized. The process of platinum printing followed, and a brief allusion was made to other papers, such as bromide, the gelatino-chlorides, Aristotype and Obernetter. A vote of thanks proposed by the President (Captain Lamb) and seconded by the Vice-President (Judge Messervy) was unanimously carried, and suitably acknowledged by the lecturer. The Committee next proceeded to the consideration of rules to regulate the admission of temporary members, the circulation of periodicals, excursions, etc. It was decided to obtain patterns for the prize certificate and with regard to the points of merit determining the award, the winning picture was to be judged (1) by artistic merit, (2) technical excellence, (3) size. On the last named point, the Secretary (Dr. H. C. Taylor) raised an objection on the ground that, if a large and a small picture were equal in merit on the first two points, the prize should be awarded to the smaller picture, as evincing more skill and labouring under a disadvantage compared with the larger one. After some discussion, in which the President said the question of size seldom if ever arose, the matter dropped. Retouching was to be allowed, but declared by the exhibitor as such. The prize picture must be taken during an excursion of the Society, may be produced by any process except stereoscopic and lantern slides, and be the work of the producer alone. Every member present at the next meeting must vote, there must be at least five competitors, equality of votes to be decided by all revoting for the two pictures, the decision of the Committee present to be final and binding in case of dispute. The next general meeting is for May 7th, and there will be an excursion (weather permitting) on May 3rd.

LEICESTER AND LEICESTERSHIRE PHOT. SOC.:—The regular monthly meeting of the Society was held on the 15th inst. It was decided to hold a meeting of the Excursions Committee to arrange the dates and places of excursions for the summer months, and to report to the next meeting. The prints sent in for competition were placed on view, and were, with general consent, considered the best the members have yet sent in; they were despatched to Mr. Brightman, 47, Vine Street, Bristol, for adjudication. A case of "Enlargements," kindly sent by the AMATEUR PHOTOGRAPHER, for exhibition at the meeting, were then sent round the table; they were of general excellence. The members who sent in prints for the competition were Messrs. Bankart, Pierpoint, Woodland, Leeder, Wilson, Joliffe, Porritt, Partridge, Cook, and Squire.

LOUTH AND DISTRICT PHOT. SOC.:—A meeting of the Louth Photographic Society was held on the 14th inst., at the residence of Mr. S. Francis Clarke, L.D.S., Ugate. In the unavoidable absence of the President, the Rev. C. W. Whistler, Captain Ranshaw was voted into the chair. The first part of the evening was occupied in discussing the merits of a large collection of landscape photographs kindly sent from London by the Editor of the AMATEUR PHOTOGRAPHER. The exhibition proved of great interest to all present, and must tend to help on landscape photography in this neighbourhood. At 7.45 the optical lantern was introduced, and about 180 prize slides were thrown upon the screen. The slides were of a sufficiently varied character to meet all tastes, comprising landscape, marine, instantaneous, street life, figure studies, home portraiture, clouds, etc. The quality and artistic merits of many of the slides met with warm approval and the exhibition proved of special interest to the Society, as two of its members (Mr. Clarence James and Mr. S. Francis Clark) has secured awards in it. The meeting terminated with a vote of thanks to the Editors of the AMATEUR PHOTOGRAPHER for the landscape pictures and *Photography* for the lantern slides. The Society is making steady progress, and arrangements are on foot for several interesting photographic excursions.

NORTH MIDDLESEX PHOT. CLUB.—The ordinary meeting was held on the 14th inst. Mr. Smith, of the Eastman Company attended to show their Kodak cameras. He said that the

* NOTE.—We are compelled to hold over notices of several novelties.—ED : AM : PHOT :

now made them in eight different forms, as the No. 1 camera, with which most were acquainted, was objected to by many on account of its small size and its giving a circular picture; the size of picture with this camera was only $2\frac{1}{2}$ inches in diameter. To meet the wishes of those whose only objection was its size, they had introduced one $8\frac{1}{2}$ inches in diameter, also one giving the ordinary quarter-plate picture another 5 by 4, and still another 7 by 5, each of these latter giving an oblong picture. He said the cameras were intended for use with their new rollable celluloid film, that in future they hoped to be able to meet the demand, as they were entitled to one-third of all manufactured in America, and were completing the enlargement of their works. In answer to a question, Mr. Smith said that the shutter worked at about one-fortieth of a second, and the speed of working might be altered by releasing the spring, which the Eastman Company were always willing to do (if taken to them) free of charge. The Secretary said there had been complaints of several markings said to arise from electrical causes; was there any probability of its always being so? Mr. Smith said there had only been one lot so marked, and it was from this, unfortunately, that Mr. Walker took those which he developed at the Camera Club, which gave rise to the idea that it might always be so, and these were taken accidentally from a stock which were known to be so damaged. A vote of thanks to Mr. Smith terminated the evening. On April 28th Mr. F. L. Pither will lecture on "Art in Photography."

PAISLEY PHOT. SOC.:—The annual meeting of this Society took place in the Committee-room of the Free Library and Museum, on the 16th inst., Mr. Donald, President, in the chair. A third prize (as recommended by the judges at the recent exhibition) in the lantern-slide class was presented to Mr. Kil-

patrick, in the shape of a finder. The Secretary (Mr. Rastall) then read his annual report, for which see PHOTOGRAPHIC SOCIETIES REPORTER. The following officers were then appointed: Hon. President, Hugh H. Smiley; President, James Reid; Vice-President, James Donald, jun.; Treasurer, Matthew Morrison; Secretary, David B. Jack (Blackhall, Paisley). Committee: Messrs. A. F. Craig, R. Ferrier, A. Kilpatrick, A. Gardner, jun., and T. Rastall. Votes of thanks to retiring officers brought the meeting to a close.

READING AM: PHOT. SOC.:—The ordinary monthly meeting was held on 16th inst., the subject being a discussion on hand-cameras. Mr. Strange sent specimen prints of the new Sepia platinotype process, which were much admired both for the tone (which can easily be varied at will) and also for the brilliancy of detail obtained. The Hon. Secretary exhibited through his optical lantern an interesting collection of slides lent by the proprietors of the AMATEUR PHOTOGRAPHER, which were a decided success, some of the slides being especially noticed. There was also shown a collection of cameras and other photographic novelties.

SHEFFIELD AND DISTRICT OPTICAL LANTERN SOCIETY.—An ordinary meeting of the above society was held at St. Paul's School-room, on April 16th. An interesting paper was read by the President, Dr. Manton, on "Instantaneous and Hand-camera Work," the best forms of cameras, lenses, shutters, plates, etc., being treated *seriatim* and very practically. The latter part of the paper was devoted to a demonstration of results of hand-camera work by means of the optical lantern. An animated discussion followed. A large supply of apparatus was exhibited. A hearty vote of thanks to the President concluded the proceedings.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3721. **Dorking and Gomshall.**—What is the best book (and its price) that describes the scenery round Dorking, Gomshall, Leatherhead, etc.—COCKNEY AMATEUR.
3722. **Budleigh, Salterton (South Devon).**—Is this place worth a fortnight's visit? If so, what are the photographic haunts in the neighbourhood? And how many plates could you take down with you with bringing many dozen back unexposed?—COCKNEY AMATEUR.
3723. **Animals at the Zoo.**—Will any kind reader who has taken any photograph of the animals give me his experience as to exposure, lens, plates, etc., best time, and most likely subjects?—SAXON.
3724. **Loan of Negatives.**—Will any amateur kindly lend me a few quarter-plate negatives? Will take great care of them, and pay all expenses.—W. J. HINCKLEY (address with Editor.)
3725. **Switzerland.**—Should be glad to correspond with a brother amateur, with a view to taking a short tour, June to July, this year.—BRUSH (address with Editor.)

3726. **Gravestones.**—Will someone kindly give me some information as to the best manner of photographing gravestones, tablets, etc.—H. G. W.

3727. **Finder.**—Will "Greenwood Pim" say what size and shape of lens is right for finder to use with $5\frac{1}{4}$ in. focus lens; what should I have to ask for at the optician's? Any hints how to make the finder would be very welcome.—E. J. W.

3728. **Scratched Film.**—Is there any remedy for scratched film on a dry plate.—R. PARKHOUSE.

3729. **Printing-out Paper.**—Will anyone tell me the best way to get the film off spoilt negatives; and if Tylar's "printing-out emulsion" is a good way to utilise the glass, or is there a better way?—S. C. H.

3730. **Bicycle Carrier for Camera.**—Will anyone give me the name of the maker of a good carrier for a camera to attach to a Premier safety bicycle?—S. C. H.

3731. **Large Kodaks.**—Will someone who has used the quarter-plate, or 5 by 4, Kodak kindly give his experience and opinion of it? What number of exposures does the quarter-plate size carry, and is it fitted with finders? The opinion of any amateur who has used the new flexible celluloid film would also be of interest to many readers. Is it actually as suitable for enlarging from as glass?—D. O. S.

3732. **Quarter-Plate.**—Could anybody give me their practical knowledge as to which they think the best quarter-plate camera for a beginner to start upon; and whether it would be better to get a complete set or not?—AMATEUR BEGINNER.

3733. **School of Photography.**—Is there a school of photography in or near London?—HIPPO.

3734. **Magnesium Ribbon.**—The instructions with Alpha lantern plates say: " $1\frac{1}{2}$ in. magnesium ribbon may be burnt one foot from the frame." Will someone kindly tell me the quickest means of igniting the ribbon?—W. H. B.

3735. **Tour in Normandy or Brittany.**—Which is the better place for photographic work? I purpose spending my holiday of two or three weeks in one or other, and wish to avoid the beaten track of tourists, preferring to make some village where living is cheap, a centre from which easy journeys on foot or by rail could be made to places of photographic interest.—H. O.

3736. **Xylonite Films.**—Can anyone tell me where I can obtain xylonite films coated with a print-out emulsion?—ARGENTI NITRAS.

3737. **Shutter.**—Will some brother please give opinion on Tylar's "Norden Flap" shutter?—ARGENTI NITRAS.

3738. **Carbonate of Potash or Soda.**—When carbonate of potash or soda is given in a developing formula, which is meant, bicarbonate or subcarbonate of potash or soda?—HIPPO.

3739. **Easing Bridge, Godalming.**—Could any amateur inform me of distance from Godalming; best time of day for photographing, and best spots for above? Might write me.—O. H. GRANT (Address with Editor.)

3740. **Instantograph Shutter.**—Will some of your numerous correspondents kindly tell me the

maximum speed of Lancaster's quarter-plate Instantograph shutter?—HYPO.

3741. **To Cut Plates.**—I want to cut half-plates into six pieces for small camera. Will anyone please say how I can do so without purchasing a glazier's diamond, as it would cost too much?—DIAMOND.

3742. **Rapidity of Plates.**—What is the relative rapidity (not the sensitometer numbers) of the following: Carbutt's films, Fry's films, Wratten's ordinary, and Edwards' isochromatic?—W. S. T.

3743. **Swinden and Earp's Hand Camera.**—Will anyone who uses this camera state if it works satisfactorily; also if there is ever any scratching of the film noticed, as I should think the latter would be liable to become damaged, either by the drop of the plate into the chamber or by the progressive movement forward by the springs in bringing a new plate into position.—MEDICUS.

3744. **Macclesfield, Plates at.**—Will some reader inform me where I can get plates, either Ilford or Mawson's Castle, at Macclesfield, as I am thinking of spending Whit week there.—DAVID DUDLEY.

3745. **Enlargements.**—What is the most convenient way of making bromide enlargements from Eastman's celluloid film negatives (quarter-plate)? The films are too flexible to remain flat like a glass negative when placed in the lantern.—G. W. B.

3746. **Negative Exchange Club.**—Can anyone please tell me of a negative exchange club, as I should like to join one?—W. S. HINCKLEY.

3747. **Foreign Amateurs.**—Will some brother amateur kindly inform me where to obtain Thomas' plates, etc. in Madrid, and other places in Spain and Mexico.—PRINCE DAKKAR.

3748. **Buxton.**—I shall be visiting Buxton early next month, and shall be glad to hear if anybody will allow me the use of a dark-room for changing plates, etc.; also if plates and necessary chemicals can be procured there.—W. L. F.

3749. **Detective Camera.**—Which is the best and most handy detective camera not less than quarter-plate? the proportion in prices to be taken in consideration.—E. C.

QUERIES UNANSWERED.

 18th.—Nos. 3703, 3705, 3708, 3709, 3711, 3715, 3718.

ANSWERS.

3669. **Choice of Shutter.**—Try the Thornton-Pickard.—BORROWDALE YEWS.

3687. **Isochromatic Plates.**—I have copied about three dozen old portraits lately on above plates with

very fair success, they being miniatures, pastels, old water-colours, and oil-paintings, and I have not at all required a yellow screen. I believe it is very useful in copying a very cracked oil painting, but not being able to make one, and finding them rather dear to buy, I did without, as the maker assures the public it is not required. If my experience would be any use to you, I shall be very glad to give it.—DEVONIA.

3692. Want of Density in Negatives.—I use Fry's 60 plates. Give a fair exposure, according to time of day and weather. Use Thomas's hydroquinone, not their made-up formula, but that issued with their plates. Get skies black as ink, and all details coming out quite sharp. Only use alum after fixing if necessary.—PETER-PIPER.

3696. Hydroquinone (Thomas's).—If your plates show no tendency to frill during development, put them in a solution of alum, strength about 2 ozs. of alum to the pint of water, and let soak for about five minutes before and after fixing. If they frill during development, put them in this alum solution before developing and after fixing.—W. A. J. CROKE.

3698. Hydroquinone (Thomas's).—Use a weak alum bath before and after fixing. Since using the above have never had a case of frilling with Fry's, whose make I always use.—BRUSH.

3698. Hydroquinone (Thomas's).—Thoroughly soak plates, after fixing in hypo (not before), in an alum solution. Don't let this be a saturated one. If you keep your alum solution saturated, dilute it with one-fourth water. After soaking for, say, 15 minutes, remove and put into a bath made up of saturated alum solution 10 ozs., sulphuric acid $\frac{1}{2}$ oz. Leave in this bath for 1 minute, remove, and wash for 10 minutes under tap, gently rubbing the film with a flat camel-hair brush, or, which I prefer, the ball of your finger (if not horny). Every trace of hypo will then have disappeared. The last acid bath has a peculiar action upon the gelatine film, rendering it quite insoluble. In fact, I have some negatives so treated, the films of which are so hard you cannot scratch them with your finger nails. Washing negatives for 3 or 4 hours in water is absolute waste of time, when you can obtain the same result with the above method. See that your negatives are fully dense.—B. DAVIDSON.

3697. Lens.—Have a slide made the same size exactly as the one fitted to your camera. Cut out a square in this slide corresponding with the square hole in the front of the camera. Fix to this a piece of tin, funnel-shaped, tapering out about 5 inches, or the extra length of focus required, fit a piece of wood at the end of this, and arrange to screw in lens. The tin could be enamelled same colour as camera. If "Snip" will send me his address I will send him a sketch.—B. DAVIDSON.

3699. Glass Positives.—No; a substitute can be found in a negative taken on a dry plate, intensified with acidified mercury solution (saturated) until thoroughly white, well washed and backed with black. It is at any time a poor substitute for the wet-plate positive; or commence to develop with ferrous-oxalate, but just before the high-lights begin to appear, add gradually a saturated solution of hypo till a red positive image appears. Fix as usual. Well wash.—B. DAVIDSON.

3699. Glass Positives.—After developing your negative in the ordinary way, immerse in a solution of bichloride of mercury. This will change your negative into a positive.—P. K.

3700. Portraiture.—With a R.R. Wray's lens you should obtain perfect definition if you focus sharply. Some people, to obtain softness, give a turn or so to the screw, getting the picture out of focus. This is a very poor substitute for softness. The difference can be seen at a glance. Softness is produced by correct lighting, full exposure, and careful development. Don't make your negatives too dense. They should not fade away in the hypo bath. If in London, shall be pleased to develop a plate to show you. Address with Editor. If printing a large head, gum sensitised paper to bottom of negative by two strips of gummed paper, proceed with printing till image is fairly delineated, remove the back, and insert a piece of smooth tissue paper, then continue printing till finished. Beautiful effect.—B. DAVIDSON.

3701. T. Mounts.—Have you tried Fallowfield, Lower Marsh, Lambeth?—B. DAVIDSON.

3702. Public Buildings in London.—No permission is needed for public buildings that can be taken from the streets, but for such buildings as the Marble Arch, Buckingham Palace, etc., write to H. W. Primrose, H.M. Office of Works, S.W., who will send you a license to take photographic views in theroyal parks and gardens.—W. A. J. CROKE.

3702. Public Buildings in London.—No permission required to photograph these.—B. DAVIDSON.

3704. Detective Camera.—I consider McKellen's, as sold by Marion, the best. It shows image same size as it will be on the plate, and you can focus it immediately before exposing.—E.

3707. Transparency.—Expose your transparency, film to film, with an ordinary plate, about 3 ft. from gas burner. Give half the exposure that you would give a lantern plate.—P. K.

3707. Transparency.—You can do it by gaslight. Length of exposure depends upon density of transparency. Cover printing frame with a piece of fine ground-glass. If a good dense picture, using an Ilford ordinary (the best to use), hold about 2 ft. from a batswingburner, expose for 5 secs., develop

very slowly, allowing negative to gain density. If picture is thin, from 1 to 3 secs. is ample.—B. DAVIDSON.

3710. Self-Toned Paper.—Very good results can be obtained with this paper. I have some pictures printed years ago, as good as when taken. Results not as good as silver paper, but infinitely better than badly-toned silver prints. You can only obtain one colour, that is brown, but warm. I heard or read that other colours had been obtained. Ask Medland, optician, Borough High Street. I think mine was Reeves'.—B. DAVIDSON.

3712. Yellow Image.—The question is generally asked the other way round—what developer will not give a yellow image? A pyro and ammonia developer will give yellow image if development is prolonged. But the price of yellow developers is soda. Make up as follows:—

Ordinary washing soda...	... 1 lb.
Bromide potassium ...	... 36 grs.
Water ...	... 4 pints.

Use dry pyro, 2 grs. to the ounce. For developing, mix as follows:—

Water ...	... 1 oz.
Soda solution ...	... 10 minims.
Dry pyro ...	... 2 grs.

Force development, or prolong it by beginning with a smaller quantity, say 5 minims of soda solution. If you use alum bath afterwards, use it saturated, because a saturated solution will not remove so much of the yellow as will a more dilute one.—B. DAVIDSON.

3712. Yellow Image.—If by this you mean a yellow negative, the ordinary soda and pyro given in any "Year Book"—BRUSH.

3713. Borax Toning.—The borax toning bath may be used immediately after mixing.—P. K.

3713. Borax Toning.—The borax toning bath must be used soon after mixing, and can be used a great number of times; of course, gold must be added each time just before toning. An old borax bath gives better results, in my hands, than a new one.—E. J. W.

3713. Borax Toning.—No; about an hour. But you can use it almost immediately, especially if it is warm.—B. DAVIDSON.

3714. Purple-Black Tones.—Use the ordinary silver sensitised paper, and tone by means of Dr. Kibbler's lead-gold bath given a few weeks ago.—P. K.

3714. Purple-Black Tones.—The bath, not the paper, gives the required tones. Try Wood's ready sensitised with the borax bath.—BORROWDALE YEWS.

3714. Purple Black Tones.—Try Atkinson, chemist, 285, Brockley Road, Brockley. Use borax bath or acetate, but add about one drop of saturated chloride of lime solution to 10 ozs. of your bath. See also Mr. C. J. Davies's letter, page 269, AMATEUR PHOTOGRAPHER, April 18th. Have not tried it, but it looks good.—B. DAVIDSON.

3716. Developer for Ilford Plates.—When such experienced workers as T. S. Mayne and Paul Lange cannot get density with Ilford red-label plates, I think it hardly likely that "J. O. S." will manage it. Mr. Mayne advises Mawson's E.R. plates in preference to Ilford's. It is not possible to do instantaneous work in dull weather, whatever size the aperture of lens.—E. J. W.

3716. Developer for Ilford Plates.—The Special rapid always take a long time to develop. The point is to get as much detail out with as weak a developer as possible at first, then to flood with one of ordinary strength, well restrained with bromide. Their own developer is the best. If this fails, try a weak solution of their hydroquinone, with no bromide.—BRUSH.

3717. Polyglot Labels.—French: Plaque photographique sensible.—Prendre garde de n'ouvrir la boîte que dans une chambre parfaitement obscure. German: Photographische Trocken Platten.—Müssen nur in einem absolut dunkeln Zimmer geöffnet werden.—B. DAVIDSON.

3719. Rapid Lens.—The Euryscope is double the speed of rectilinear, consequently more suitable, though the depth of focus is less in the Euryscope when worked with full aperture.—E. J. W.

3719. Rapid Lens.—I think that the Optimus rapid rectilinear will suit every case of artist with double-extension camera. Cannot speak for Eury-scope, as I have not used it.—EXPERIENCE.

3720. Intensification.—Pin-holes in negatives intensified with bichloride of mercury and ammonia can be to a great extent avoided by using the following precautions:—Filter your saturated mercury solution. Keep rocking the dish whilst allowing it to deposit on the negative. Wash well. Use distilled water with the ammonia. I believe this to be most important. If you add ammonia to ordinary water (mine is the Kent Water Works Company), you will notice the appearance of a large number of minute particles of some chemical substance, and I fancy these settle on the film and cause pin-holes. To render intensification a pleasure, avoiding markings, etc., acidify your mercury solution, say $\frac{1}{2}$ oz. of sulphuric acid to 20 ozs. of the mercury solution. This neutralises any trace of hypo left in the film, and the result is a clean, bright negative, in place of a dirty, stained, uneven-printing one. If you do not require too much intensification, try the following method: After well washing (and before fixing, which you can always do in ordinary actinic light, although you will find a good many benighted

photographers are afraid to try it), put the negative in the sunlight, and let it remain there for a few hours. Then fix as usual. You will find it has increased wonderfully in density. Don't forget to wash developer off thoroughly, say for 2 or 3 minutes under tap.—B. DAVIDSON.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED : AM : PHOT.

G. N.—We shall be very pleased to have photographs suitable for our Hospital Albums, and also to criticise your work.

S. H. BRACKETT (Vermont).—Many thanks for your letter.

MISS H. BEATSON.—It is quite useless for practical purposes.

R. W. BUTTEMER.—The photographs you send of Hyères are really excellent, and the prints on matt-surface paper are extremely effective. We must compliment you upon the warm tone; they have perhaps a little too much purple in them. The slides will be very interesting, and we hope you will allow us the loan for a day or two when complete. About the Hyères pictures, it would be absurd to improve nature by putting in clouds into a cloudless sky.

O. S. R.—(1) "Experiment Photography" (Leaper), 1s.; also "Picture Making by Photography" (Robinson); both of our publishers. List of books sent you by this post. (2) The one you name is a very good one. (3) We should advise you to buy a corrugated zinc rack, and set it in vessel containing water, allowing the water from the tap to run very slowly into the vessel.

THOS. L. BUCK.—(1) In awarding the AMATEUR PHOTOGRAPHER medals, artistic treatment of subject is always the first consideration; no one printing process or size of picture stands a better chance than another. (2) The awards will be made shortly.

F. A. G.—We place the lenses in the following order: 4, 1, 6, 5, 3, 2. You will note we place your No. 2 last. No. 1 is a most useful lens, giving admirable definition. We like No. 4, which is also an English made lens, and most carefully and thoroughly corrected.

J. HARPER SCAIFE.—We will look into the matter. It is intended that the pictures shall be sent in on or before the 14th of each month. For instance, the "Instantaneous" subjects are due on or before the 14th of May. Many thanks for your concluding paragraph.

T. BRUSHFIELD.—Your query is inserted, and also your suggestion commented upon in "Our Views," about the "Travelling Studentship." Are you likely to be in town? If so, please call any Monday afternoon or Thursday morning.

DALLINGTON.—Too much foreground, figure out of place and very inelegant, selection of view fairly good, all manipulatory work very good. Your lens is of a first-class make and capable of doing the very best work.

H. R. TAYLOR.—Ordinary commercial pitch will render the tray water-tight, but we should advise careful jointing, and the outside pitched and painted.

ALFRED WATKINS.—We are having the article typed, and will forward proofs.

A. BROWN.—We know of no camera that fulfils your requirements; the nearest is the one you mention, but with it the usual dark-slides are used, it might be possible to fit a changing-box to it.

JOSEPH ROSS.—Your letter is under consideration; we will write the gentleman you name.

MELLING.—We think No. 2 the best, because the work we have seen done with it is better than with the other. They are both excellent lenses, and in capable hands the work would be equal.

W. S. L.—We cannot recommend either film. Both plates are good, but we should advise C. Afraid we are not in a position, from personal experiment, to give the relative rapidity. We find that in the "Dictionary of Photography," C are not given, and D are given as 50-100 times, but no sensitometer number is given. Your query is inserted.

MISS CRESSWELL.—Queries and answer inserted, with many thanks.

MOULLEAU.—All sizes are admitted for competition for the "Travelling Studentships."

JAS. W. DOLEY.—We are afraid we cannot help you. We at present know no one competent to write up the subject; but will keep on the look out.

A NEW READER.—We have in the press "Art of Retouching," by J. Hubert, to be published at 1s.; but it is not ready yet. Another book is published by Marion and Co., by Johnson, price 2s. 6d.

R. ATKINS.—No. 187 far too dense. No. 186 too thin. No. 184 well selected; river weeds in foreground show very prominently, and do not improve the picture. No. 185, thin, with slight halation from foliage. Studies of boys not suitable for public competition. 193 is a most unsatisfactory tone. As a whole, they are not at all up to average.

M. C. C. LUDER.—The half-plate photograph appears to us to have been vastly under-printed; the other is badly toned. You should read up the subject. Buy "Experimental Photography" (Leaper), and take care to follow directions given.

J. W. WADE.—We will write the gentleman you suggest, and are much obliged.

REGINALD H. GREEN.—Your name is added to the list for consideration.

J. BROWN.—Many thanks for letter. Shall be writing you shortly.

T. BARCLAY.—Very glad to hear of the proposed exhibition to be promoted by the Edinburgh Photographic Society.

THOMAS WIDDOP.—Thank you for list of Rambles, which we note in another column. We will write to you, and then answer the remainder of your letter.

C. V. SHADBOLT.—"Travelling Studentship" forms are being sent you by post. Many thanks for suggestions re "Monthly Competitions." We shall endeavour to act upon some of them. Very glad you are now a regular subscriber.

J. F.—We have sent your letter on to Mr. C. S. Cobb, who will probably write you.

JOSEPH W. SPURGEON.—Report in time. The paper is rather long for the *REPORTER*, so fear it will have to be cut down. As you suggest, the MS. shall be returned. We have advised our publishers about copies.

D. D.—There will be no "Prize Tour Competition" until next year. Conditions will be published in July. There are "Monthly Competitions." See announcements.

W. GLADSTONE.—The mark has certainly the appearance of flare-spot. If your diaphragms are worn and bright, the cause could probably be traced to them. We might help you better perhaps if you sent us the lens. If not, get the diaphragms blackened, and let us know the result.

COMPACT.—You want so much "compactness" that we fear there is no camera in the market that will fulfil all your requirements. A, B, C, F, S all carry a dozen plates. The best are A, B, C; none of these have double backs. Either will meet your requirements. As to lens, A, B permit of adjustment of focus, but only A has a focussing screen. For compactness, certainly A; in the improved form it has almost all you require. B you can have any make lens. We have just handled one of this make, and been much pleased with it. The focus is "set out" on a scale, and is adjustable by a lever. C, you have no means of adjusting focus. D, the makers cannot spare one for us to see. We do not advise F or G. We should prefer A, B, C. Shou d advise you in the following order, A, B, C.

T. J. H.—(1) You do not say in what counties. Some excellent articles have been published in the *AMATEUR PHOTOGRAPHER* under the heading "Holiday Resorts and Photographic Haunts." Look up last year's volumes. *b* is a good lens. *c*: It is reported so, but if you want a lens for detective work, have *b*; at least that is the most suitable that you have named.

R. S.—The hand-camera is a well-made apparatus, and like all work sold by the firm, thoroughly reliable.

T. B. B.—We should prefer B.

R. TUSON.—(1) The camera is useless. (2) If you are anything of a carpenter, you could easily fit another front to carry the lens.

FINDUS.—A is far away the best; the single combination will give you a good landscape lens. C: These lenses are very good, and cheaper than A, but they are certainly not superior.

G. W. B.—Both lenses are good value, and if price is an object, you will, we think, be quite satisfied with I. The firm you name are turning out first-class work, and you will be quite safe in buying the camera of them. We like 2 shutter, and so will you.

H. L. LANCASTER.—A, as sold, has a French lens; the instrument seems to be well made, and in competent hands answers admirably. B has some good points, but it is a very slight improvement upon B. C and D we should not advise you to go in for, they are not well finished. F is a very handy detective camera, well made, and most compact. G is beautifully made, and has recently been described by us. A has a scale and lever arrangement for setting focus; very slight liability of plate changing mechanism to go wrong; a good shutter, quite reliable. E: No arrangement for setting focus; free from any difficulty in changing plates. A poor and somewhat uncertain shutter. F: Good lens; focussing screen if desired; easy and portable changing arrangement, and to all appearances a reliable shutter. We recommend A, E, or F.

F. W. PILKINGTON.—They can be returned at any time, but we shall probably require duplicate prints for criticism, etc.

A. D. FORT.—The camera, for a cheap article, is well made, and reliable. If you get an R.R. lens you will be able to do all you at present wish to do.

CYCLIST.—The following is the rule:—Divide the

focal length of the lens by the diameter of the diaphragms. A is certainly not as good an instrument as C; the latter would be handy for cycling. B is better still for all-round work, especially *f*, which we should advise you to go in for. The finders are most useful.

KENNEBO.—Your prints are certainly quite up to average work; slightly over-orient perhaps. No. 1: Your foreground is rather wide, and the foliage on right is a doubtful improvement to the picture. No. 2 is very charming; a well broken foreground, and good distance, and over the whole, bright and crisp definition. No. 3: Again too much foreground, but a good and clear picture. No. 4: Well composed; probably a rather thin negative; printing somewhat too deep. No. 5 is over-printed, and the detail in foreground as a consequence indistinct. No. 6: Interesting, but "cut off" on left hand. You have good negatives; many of them would give you nice prints on matt-surface paper. Try squeegeeing Aristotype or Obernetter on ground-glass. Glad to see your work later on. You might, if careful in printing, enter for one of our "Monthly Competitions."

JAS. DUPIN.—We will think about the matter. Have given Enfield a line in "Our Views."

JOHN C. LIVINGSTON.—Yours is a capital letter, for which we thank you. Medals are all in hand, probably the end of next week.

E. J. TAPSON.—Two good formulae were given in this column last week. Will send you toning formula later.

S. HOLDSTOCK.—Hyde Park, and Royal Parks, Mr. H. W. Primrose, H.M. Office of Works, London, S.W. Victoria and other parks, London County Council, Spring Gardens, S.W. Wandstead Park, Sir John Monckton, Guildhall, E.C.

H. F. C.—Many workers do not object to a stained or yellow negative, which, with care, gives excellent prints. A negative clear and bright is much more difficult to print from, requiring careful exposure. There is, at least, no reason to discard a negative because it is stained. No. 1 the best, but posing in both shows want of knowledge; read up "Pictorial Effect in Photography" (Robinson). No. 1 too full face, consequently face appears flat, hands very much out of plane, are white and hard. No. 2 not sufficient gold in toning bath, consequently a bad colour. Send us some of your work in three months.

GEO. N. FELL.—Major Nott has kindly given us the following answers to your queries: Day and month? Any day except Monday—month, May and June—long focus lens, or rather one not a wide-angle. Shutter work in some instances is necessary, in others a second's exposure can be given. Light is not good enough for any animals indoors, but now and again a plate might be risked on the off chance. The more rapid the plates the better always, presuming they are of a first-rate quality. Eastman's new film is sufficiently rapid, considering it is quite as rapid (if not more so) than any plates on the market. The subjects considered interesting will depend on individual taste. Some prefer the larger animals, others the birds.

G. W. GRIFFITHS.—We hardly look at the matter in the same light. No objection has before been raised to the conditions.

W. J. HINCKLEY.—Cannot help you, have inserted as a query.

SAWBONES.—We never give names of makers. You will have a good camera in either 1 or 2, but we think you will be quite satisfied with No. 1. Lenses: No. 1 is a good instrument, and so are 2, 3, and 4. You must be guided by what you want to spend. They are all first-class, but we place them in the following order, 2, 3, 1, 4.

OXONIENSIS.—We are writing you fully re Hand Cameras. Sorry not to have had the pleasure of meeting you at the C.C. Conference.

A LADY AMATEUR.—If you do not want an expensive hand-camera, by all means "go in" for No. 1, with R.R. lens. You will find it answer your requirements; better, perhaps, than any of the others, unless you are prepared to go in for a much more expensive apparatus.

DEVONIA.—Could not give an opinion without seeing the plates; will you send them up?

RICHARD HOLDER.—If you buy your lens of the firm you name, we are certain that you will be perfectly satisfied, they sell a first-class instrument.

column, provided such apparatus, etc., is forwarded by the SELLER to him to the offices of the *AMATEUR PHOTOGRAPHER*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer."—*AMATEUR PHOTOGRAPHER*, from September 23rd, 1887, to present (one number missing), perfectly clean; what offers?—Crommelin, Carrowdore Castle, Donaghadee, co. Down.

AMATEUR PHOTOGRAPHER, unbound, vols. 6 and 7, clean; what cash offers?—Payne, 139, Belle Vue, Shrewsbury.

Apparatus.—Good half-plate, tripod, single c.d.v. lens, and stops; would sell, 15s., or exchange anything useful.—G. Clarke, Grove Place, Saffron Walden.

Sell or exchange, quarter hand camera, complete, with six slides, 40s.; leather camera case, 10s. 6d.; quarter combination portrait lens, with diaphragms, 18s. 6d. Wanted, good quarter camera and lens.—Sanderson, 50, Victoria Road, Morley.

Photographic apparatus for sale, including toning dishes, printing frames, etc.; also a quantity of chemicals; also printing apparatus, with quantity of type.—Address, J. W. H., 2, Church Lane, Hornsey, N.

Banjo.—Perfectly new 8 guinea 5-stringed banjo, rosewood handle, veneered, inlaid engraved pearl, carved ivory pegs, 40 brackets, Rogers head, grand instrument, offers requested; cash or photographic exchange; approval; deposit.—Address, A., 5, Caroline Street, Birmingham.

Cameras.—Lancaster's Instantograph quarter-plate, with shutter and three double backs; cost 55s.; will take 35s.; almost new.—W. L. Hodge, 24, Chapel Street, Southport.

Half-plate horizontal, mahogany, leather bellows camera; price 16s.; bargain.—Gardner, 4, Arboretum Terrace, Nottingham.

Half-plate Optimus, square bellows, long-focus camera, and three slides, fitted in leather case, perfectly new, in perfect condition; offers wanted.—G., 18, Sandringham Road, Dalston.

10 by 8 Optimus camera, two double and one repeating backs, new, double extension, every improvement, waterproof case; cost £14. 7½ by 4½ camera, with G. Hare's patent automatic changing box, good condition; both cheap, cash.—Knight, Middle Street, Southsea.

Stirn's circular camera, large size, quite new; 25s.—S., 10, Burton Crescent, W.C.

Cameras, etc.—Half-plate bellows camera and enlarging lantern, condenser, view lens, carrier for quarter-plate, suit beginner, no stand, specimen enlargement shown, in polished case, complete, 16s.; also quarter Lancaster's Instanto lens and drop shutter, 10s.—Mummery, 23, Millard Road, Stoke Newington.

5 by 4 camera, Gotz's patent, central swing, revolving disc for lens, every possible movement, beautifully made, also four double backs, with carriers for quarter-plates, complete set of Eastman's patent film carriers, all newest condition; price £7 10s.—No. 54, *AMATEUR PHOTOGRAPHER* Office, 1, Creed Lane, Ludgate Hill, London, E.C.

Half-plate studio camera, two slides, portrait lens, good condition; offers.—Lawton, Bank Top, Morley.

Quarter-plate camera, swing-back, rack focus, six Blair's feather-weight slides, camera case, new, compact; 45s.—S, Midland Road, Gloucester.

Canoe.—Exchange splendid clinker-built canoe for photographic set, hand-camera, or Safety bicycle; approval.—P. F. Hayden, Graigue, Kilkenny.

Enlarging Apparatus.—Marion's enlarging apparatus, 7 in. condensers, new, cost £7, further particulars if wanted; would exchange for f/7 rapid rectilinear lens by good maker.—H. Wigan, East Malling Vicarage, near Maidstone.

Enlarging Lantern.—Optimus enlarging mahogany-body lantern, 7 in. condensers, four carriers, complete with lamp, quite new; £5; no lens.—George Potts, Chesterton Road, Cambridge.

Hand-Cameras.—Quarter detective camera, in red morocco case, three very best double backs, two finders, time or instantaneous shutter, focussing lever, can be used on tripod; 5 by 4 R.R. lens; cost £7 10s.; for £3 15s.—No. 53, *AMATEUR PHOTOGRAPHER* Office.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the *AMATEUR PHOTOGRAPHER* will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange"

Kodak, in perfect order, with 50 exposures, carrying case, instructions, etc.; price 75s.—Rev. Atkins, Normandy, Guildford.

Kodak detective camera, equal new; cost 105s.; price 70s.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Demon detective camera, nearly new; 3s. — W. Shepard, 19, Surrey Street, Derby.

Kodak detective camera, equal new; cost 105s.; price 70s. lowest. — Bygrave, 15, Canterbury Road, Brixton, S.W.

Kodak, hardly used; £2 18s. — Ellis, 7, Park Village West, N.W.

Stirn's detective camera and circular printing frame, nearly new, plated, samples sent; £1.—L., 4, Victoria Terrace, Ryde, I.W.

Hand-camera, quarter-plate, in leather case, six slides, in leather case, good condition, gives splendid results; what offers? — L. Lawton, Bank Top, Morley, near Leeds.

Facile hand-camera, rectilinear lens, finder, as new; £3 6s.—Ruddock, 59, Plantaganet Street, Cardiff.

Diamond hand-camera (Talbot and Bamar), new; 21s. Wanted, half-plate second-hand printing frames. — Arthur, 87, Augustine's Road, N.W.

Lantern.—Lantern, 4 in. condensers, portrait lens, rackwork, three-wick lamp, safety jet, and instantaneous carrier; 40s.—C. Naylor, Batley.

Lenses.—Sands and Hunter's quarter-plate rapid rectilinear lens; 25s. 6d.; cost £2.—J. M. Butler, 33, Dorset Street, Baker Street, W.

Lens, plano-convex, for half-plate camera, cheap. — Griffiths, Spencer Street, Carlisle.

Half-plate Voigtlander Euryscope lens, excellent condition; 83s. — Bygrave, 15, Canterbury Road, Brixton, S.W.

Portrait lens, 5 by 4 (by Emil Beusch), Waterhouse diaphragms; 35s.—Brett, 14, Regina Road, N.

Taylor's 5 in. detective lens, Iris diaphragm, covers a half-plate; cost £3 17s. fortnight ago; sell for £3 10s.—54, Chesham Road, Tottenham.

Lancaster's half-plate Instantograph lens, Iris diaphragms, 20s.; also quarter-plate ditto, revolving diaphragms, 10s., with Lancaster's shutters. — A. J. Hendrie, Thornwood, Uddingston, N.B.

Optimus 7 by 5 rapid rectilinear; 40s., perfect.—Bennett, 43, Avenell Road, Highbury, N.

Lenses, etc. — Optimus 7 by 5 rapid rectilinear lens, new, perfect condition, 35s.; also shutter for same, 10s. — Arden, 28, Mount View Road, Stroud Green, London.

Dallmeyer's whole-plate rectilinear landscape lens, £4 18s.; Thornton-Pickard time shutter, fit above or 2½ in. hood, 17s. 6d.; both new.—Graham, Chemist, Stockton.

Cabinet portrait lens (by Sands and Hunter), cost 63s. last year, price 20s., excellent definition; Wray's half-plate R.R. lens, used twice, 55s.; half-plate Instantograph tripod, 3s. — 75, Smedley Road, Cheetam, Manchester.

Lever Watch.—Will exchange good silver lever watch, quite new, cost £2, with warranty, for Instantograph quarter set, or any good quarter set.—W. Brett, 9, Bulgaria Street, Armley, Leeds.

Microscopic Slides.—Will exchange pathological

microscopic slides (by Cole) for good lantern slides. — Becher, 15, Jermyn Street.

Printing Press.—New printing press, 34 letters, complete; 3s. 6d.; carriage paid.—Thomas Milburn, Babbie Hill, Hexham, Northumberland.

Sets. — Underwood's 1888 Instanto camera, dark-slide, tripod, R.R. lens; cost 5 guineas; bargain, 70s.; new.—Slade, Slad Road, Stroud, Glos.

Lancaster's whole-plate camera, two double backs, dark-slides, strong tripod and case, also splendid Eureka lens; price £5.—Tunstall, Amateur Photographic Association, 3, Lord Street, Liverpool.

Half-plate, Perken and Rayment's camera and lens, with one double dark slide, one printing frame, and two developing dishes, in wood cabinet, also folding tripod; cost £6 6s., what offers in cash? Willing to have Editor's report on apparatus.—Charles Holworthy, 46, Widmore Road, Bromley, Kent.

Quarter-plate Instantograph 1886, lens, shutter, two double backs, case, and tripod stand (new make), camera much used, but in good working order; 25s., or what offers.—E. Harrison, Rossendale Lodge, Streatham Hill.

Quarter Instantograph set complete, three double backs, with cases for camera and tripod; I will exchange the above for half-plate, with a little money; approval.—J. Ward, 74, Love Lane, Heaton Norris, Stockport.

Camera, 7½ by 5, Watson's Tourist model, swing back, sliding front, three double slides, leather-cases, tripod, legs, etc.; £5, cost £12, or will exchange for value in whole-plate long focus landscape lens, stereo lenses.—Tresilian, 31, Lower Sackville Street, Dublin.

First-class half-plate camera, double backs, R.R. lens, and tripod.—Ridgway, 1, Sparrow Corner, Minories.

Lancaster's quarter International set, complete; price 34s., cash.—189, Southampton Street, Reading.

Lancaster's whole-plate Instantograph lens and shutter, Burr's carte-de-visite lens, sliding body camera, and ash tripod, Ross' compound stereo lens; the lot £5 10s., or exchange for Safety bicycle, or pony trap.—W. Humphrey, St. Osyth, Essex.

Capital quarter-plate camera, three double slides, tripod, Optimus R.R. lens, all perfect, new last season; 55s.—Address, A., 5, Caroline Street, Birmingham.

Sets, etc.—Quarter-plate camera, two double backs, lens, and tripod, suit a beginner; price 21s. Also about fifty numbers of AMATEUR PHOTOGRAPHER; price 5s.—David Dudley, 7, Hutchinson Street, Widnes.

Stand, etc.—Kennet's guinea half-plate stand, little used; 10s. Two volumes, cloth, AMATEUR PHOTOGRAPHER (VI., VII.); 7s.—Kemp, 17, Gladstone Terrace, Edinburgh.

WANTED.

Book, etc. — Dr. Eder's book on "Modern Dry-Plates; also a pneumatic plate-holder. — S., 22, Bagby Road, Leeds.

Cameras. — Half-plate Instantograph camera, with slides and stand, good condition, cheap, for cash.—Sinclair, 29, Well Street, Paisley.

Quarter-plate camera.—State make and price to S. Kirkham, Court Place, Carlisle.

Half-plate Underwood's Instanto, with lens, good condition and cheap; approval. — G. Gosling, Ashbourne Lodge, Lausanne Road, Hornsey, N.

Camera and Lens.—Half-plate camera, modern make, three double backs, and Optimus or Optimus Euryscope lens. — Viney, 1, Creed Lane, Ludgate Hill, E.C.

Camera Cases.—Half-plate camera case, cheap.—R. B., 5, Nassington Road, Hampstead.

Leather camera case, whole-plate, or leather bag, about 18 by 12 by 8. — Whitcliffe, 12, North Street, Burnley.

Dark-Slides.—Two quarter-plate dark-slides, to fit Lancaster's International camera.—Smedley, 25, Calvert Street, Derby.

Enlarging Lantern.—Two enlarging lanterns, 7 or 5 in. condensers, Lancaster's or other make.—Particulars, price to W. N. Worran, 8, Abney Park Terrace, Stamford Hill.

Hand-Cameras.—Abraham's Ideal or Fallowfield's Facile.—Bentley, Acacia Villa, Leicester Road, New Barnet.

Detective camera.—Particulars and lowest price to A. D. Clarke, Pailton, Rugby.

Lamp.—Lancaster's Rubralux lamp, good condition, and cheap.—Rev. E. Page, Torquay.

Lens. — Rapid rectilinear lens, half-plate, English maker.—Percy Gieve, Dore, Derbyshire.

Photographic Quarterly.—PHOTOGRAPHIC QUARTERLY, No. 1.—437, St. Helen's Road, Daubhill, Bolton.

Safety.—A rear-driver Safety bicycle, good and cheap.—J. Jones, Aberleine, Newcastle-Emlyn.

Shutter.—20 ft Optimus quarter-plate lens, Kershaw or Thornton-Pickard type; will give in exchange very good single lens and shutter.—Wilton, 11, Hall Grove, Leeds.

Tripod.—Whole-plate portable tripod, cheap.—John Wilson, Altmere Street, Glenarm, Belfast.

PLEASURE CRUISES TO THE LAND OF
the MIDNIGHT SUN.—THE ORIENT COMPANIES' steamships GARONNE (3,876 tons) and CHIMBORAZO (3,847 tons) will make a series of TRIPS TO NORWAY during the season, visiting the finest fjords. The dates of departure from London will be as follows, and from Leith two days later:—
June 4th, for 15 days | July 15th, for 15 days
June 18th, for 27 days | July 23rd, for 27 days
June 25th, for 15 days | Aug. 8th, for 21 days
The steamers will be navigated through the "Inner lead"—i.e., inside the fringe of islands off the coast of Norway—thus securing smooth water; those of the 18th June and 23rd July will proceed to the North Cape, where the sun may be seen above the horizon at midnight. The Garonne and Chimborazo are fitted with electric light, hot and cold baths, etc. Cuisine of the highest order. A

Dark Room provided for the use of Photographers.
Managers, F. Green and Co., 13, Fenchurch Avenue; Anderson, Anderson, and Co., 5, Fenchurch Avenue, London, E.C. For further particulars apply to the latter firm, or to the West End Agents, Grindlay and Co., 55, Parliament Street, S.W.

✿ OUR VIEWS. ✿

To hold as 'twere the mirror up to nature."—*Shakespeare.*

THE annual report of the proceedings of the Photographic Club for 1889 contains much valuable information. The Club possesses a very complete library, many of the books being very scarce.

* * * *

EVERY one is now talking of the Liverpool Exhibition, and we devote a leader to the subject. It is gratifying to us to find that, although there is to be no distinction made between amateur and professional, the AMATEUR PHOTOGRAPHER conditions—which provide that the photograph must be the entire work of the exhibitor, posing, selection of subject, exposure, development, retouching, printing, and toning—are to be strictly adhered to; and also that no picture which has previously been exhibited will be allowed to compete. From time to time we shall notice the progress being made by the Executive, and are sure that in Mr. Thomas Mayne, the Hon. Secretary, the Association have the right man in the right place.

* * * *

THE Lantern Society held their inaugural meeting last week; there was a large attendance. A report of the proceedings will be found in another column. This Society will add much to the entertainment of those interested in photography, and the public, during next winter. Active work will be commenced in October, and Lieut. C. E. Gladstone will be pleased to hear from intending members.

* * * *

IN a recent breach of promise case, *Colvin v. Leyland*, the following discussion took place upon the power to photograph:

The plaintiff had made an affidavit, in which she mentioned two letters of the defendants and a photograph; and the defendant had obtained an order that he should be allowed to take photographs of the letters and the photograph, from which order the plaintiff appealed.

Mr. Ruble appeared on her behalf, and urged that there was no power to order photographs of letters.

Mr. Justice Mathew: They are only copies, and copies by way of facsimile.

Lord Coleridge: What on earth is the use of appealing against such an order?—

What is the use of photographs of the letters?—Lord Coleridge: There may be a question as to the handwriting?

Why should the photograph be photographed?—Lord Coleridge: It may be desired to show that it is not a photograph of the defendant. It may be a photograph of somebody else?

Why should such an order be made?—Lord Coleridge: Really, it is almost enough to make one lose one's temper to find such an order appealed against. Why in the name of common sense, should it not be made?

The plaintiff's solicitor says that the letters do not refer to the promise and are in no way material.—Mr. Justice Mathew: But the defendant may think them very material.

Lord Coleridge: You appear to think them material, or why do you appeal?

The rule does not mention photographs.—Mr. Justice Mathew: They are really copies.

The Court without calling upon them, dismissed the appeal with costs.

* * * *

As promised, we commence the publication of the list of towns where "dark-rooms" have been placed at our disposal. In this list we shall include no town unless the owner has filled up our form. We shall, of course, gladly forward a form to anyone kind enough to extend to us the privilege of introducing photographers. It will be noted that owners may be amateurs, dealers, or professional photographers, hotel-keepers, or photographic societies. In the latter case we strongly counsel the executive of societies to permit temporary membership for a nominal fee of, say, 2s. 6d. per month. Temporary membership is permitted by the Bath and the Southsea Societies. This week we have delighted a gentleman visiting Bath, by informing him that he can secure the privileges of membership for so small a sum. This year we are able to give applicants for "dark-rooms" much information, and the letter of introduction will, in some cases, set out particulars of the four divisions or classes of accommodation. We hope to extend the work to the Continent, and in this connection we cannot refrain from calling attention to the very useful information given in the May number of *Photographic Scraps* upon "Continental Photography." Anyone going

For Contents, Notices, etc., see page 325.

on the Continent should secure a copy of *Scraps*. In addition to giving the names of dealers, in every instance the correct wording, in the language of the country, is given to be written on boxes of dry plates to advise the authorities of the dangers of exposing to daylight. Mr. Howson is to be congratulated upon the admirable result of what must have been a difficult task.

* * * *

MR. D. R. CLARK, of Glasgow, has been successful at Glasgow, where he has been awarded the AMATEUR PHOTOGRAPHER Silver Medal for the most artistic picture in the Exhibition for the "Trysting Tree," and at Belfast he has also taken honours. A very excellent reproduction in collotype of one of Mr. Clark's photographs, an interior, "The Mosque of Sultan Achmet," is published in the April number of the *Art Review*. Mr. Clark thus describes how he was enabled to accomplish the very difficult task of photographing the interior of a mosque:—

"Having my camera with me when in Constantinople, I was determined that if possible I should carry away with me, amongst other negatives, one at least of the interior of the Mosque of Sultan Achmet. The first time I visited it, I proposed to one of the attendants, through my interpreter, to ask permission of the chief Imam to photograph the interior. This, I was told, had never been done; it was impossible. I suggested that a gift of money to the funds of the Mosque might be a means of doing good, while at the same time I might be able to show to my countrymen what splendid architects the Turks were. Knowing too, by this time, something of Eastern bargaining, I began by offering one medjideh, and suggested a possible half more; but these overtures were rejected with scorn. Two days later I returned armed with the camera, which I judiciously left outside, and began again to try the virtues of *bakshish*.

"Would not one medjideh do?" I asked.

"No!"

"Would two do, then?"

"No!"

"Well, how much?"

"The attendant would see the Imam again, he said. We waited, and at last he returned saying five medjidehs should be the price.

"Ha! ha!" I thought, "I have you now!" And then came the bargaining—a species of Dutch auction on his part and regrets on mine—ending in the triumphant entrance of myself and camera at a cost of three medjidehs. I was told to hurry in by a little side door, and to keep quiet, and beside one of the huge sheltering pillars I erected the tripod, and thus from the gallery above photographed the interior of the beautiful Mosque of Sultan Achmet."

* * * *

THE Committee of the Camera Club announce that they have arranged to exhibit the photographs taken by the late Mrs. Julia Cameron. The Exhibition will be opened on Monday the 5th of May, and will probably remain open for two months. The exhibition is free on presentation of visiting card.

* * * *

THE claims of the AMATEUR PHOTOGRAPHER to be recognised as an art journal are now conceded by almost all, but it is not generally known that the "Galleries" are kind enough to send us invitations for Press views, and that this year such invitation has been received from the Council of the Royal Academy. We hope each week during the season to devote some space to a review of one or other of the "Galleries," and shall call special attention to those works which teach a lesson to photographers, and to the pictures whose authors could learn a lesson from photography.

WE understand that it is intended to form a photographic club in connection with the Birkenhead Y.M.C.A. A preliminary meeting will be held on Saturday, and those wishing to join are asked to send their names to Mr. F. R. Kay, 42, Conway Street, Birkenhead.

* * * *

UPON the occasion of the meeting of the Lens Standard Committee of the Photographic Convention of the United Kingdom on the 25th ult., the following resolution was passed: "That this meeting recommends that a meeting be called of as influential a body as possible of manufacturing opticians, to decide upon the most convenient series of sizes for standard flanges and camera screws, that shall be most suited to meet existing conditions of their manufacture. These standard flanges, at present, to be limited in number, and, when decided, to report to the Committee of the Photographic Convention of the United Kingdom. It is also suggested that the question of means for their adoption be decided upon." The meeting was adjourned until the 9th May, 1890, and will be held at the Mona Hotel, at 7 p.m.

* * * *

THE Photophane, Limited, advise us that they intend to keep their list open for a few days, in order to give the trades interested in photographic reproductions an opportunity of taking up shares. Our opinion of the Company's prospects was given in last week's issue.

* * * *

PHOTOGRAPHS AT NEWCASTLE.

FOLLOWING up our comments made by us last week upon the Exhibition, we will take Class E (Portraits on Gelatino-Bromide Paper), a small class with only six exhibitors. The silver medal goes to Messrs. Auty and Ruddock for a very much worked-up portrait, "Miss Maudlin." Mr. H. J. Tear shows two very fair pictures in "Dorothy" and "Galatea." Mr. Welford "Miss Pert," which is a colourable copy of a picture with the same title to be found in Mr. Lyd. Sawyer's reception room. Of Mr. Sawyer's productions we much prefer "The Spring Time of Life."

The "Architecture" Class is larger, and contains some good work. Mr. R. Keene (Derby) takes a silver medal for "Six Interiors of Derbyshire Churches," which are certainly very fine, but we prefer the work of Mr. W. Parry, who is awarded a bronze medal for three views of "St. George's Church, Jesmond." These views are on Whatman paper, sensitised by the ammonia-nitrate bath; the warm tone and matt surface are peculiarly suited to the subject. Mr. J. Pike shows two views of Newcastle Cathedral, one of Durham, and another of the interior of the *Newcastle Chronicle* offices, all well and carefully executed. A very excellent subject, well and boldly treated, is "The Tower of London," by Mr. F. W. Edwards. Mr. Gibson does not take honours in this class, but, in our opinion, his picture "Bamborough Castle," is equal, if not superior, to any exhibited. Mr. Sawyer shows three views of "Castle Garth," which have been seen before by many of us.

In the "Instantaneous Class," the silver medal is awarded to Mr. Parry, and richly deserved. His "S.S. Courier," "S.S. Planet" and "H.M.S. Victoria" show splendid work. Mr. Sawyer is also awarded a silver medal of equal value

for his "On the River Tyne," "Foggy Weather," and the "Penny Ferry," all of which have been reviewed in the AMATEUR PHOTOGRAPHER, and received recognition at other exhibitions. The yacht studies of Messrs. G. West and Sons as usual attract much attention. Mr. W. P. Marsh sends his "Sea Studies," which are full of life and vigour. Mr. J. E. Dumont, an American amateur and AMATEUR PHOTOGRAPHER medallist, sends three pictures, of which the best is "With Favouring Winds o'er Sunlit Seas." "Stranded" we have never cared for. It was, if we remember rightly, reproduced as a supplement in the *Photographic Times*, of New York. The negative is probably a thin one, and the photograph sent is too deeply printed. Mr. R. S. Redfield, also an American, sends "Crackers and Milk," "Making Friends," and "Feeding the Chickens," all simple subjects admirably handled. Messrs. Auty and Ruddock again contribute several pictures, of which the best is "A Hazy Morning."

Class H, "Genre," has a large number of entries and many *very old* friends. The silver medal is awarded to one, "Your Turn Next," by Mr. F. Whaley, a stagey, unreal piece of composition. An extra silver medal is given to another well-known picture, Redfield's "Victuals and Drink." A bronze medal goes to Mr. Winter's well-known picture, "Does Granny Like Butter?" and the extra bronze medal to Mr. Sutcliffe for "Excitement," which has been shown repeatedly under, we think, another title. The judges in this class evidently worked upon "public form," and upon the principle that as the pictures had all been medalled, they were safe in awarding them other medals. Mr. Byrne shows two dreadful pictures in "The Village Artist (Youth)" and "The Town Artist (Experience)," both stated to be direct and untouched. The composition is stiff and stagey, the figures much too large for the plate, and the whole a failure, neither of them having the slightest claim to be called pictures. Another failure by the same artist (?) is "The Poor Crossing Sweeper." Mr. R. W. Robinson sends "The Pedlar," in which he introduces too many figures, all of whom are unoccupied, and not interested in the pedlar's ware, but sensible of the fact that they are making up the picture. Mr. Sutcliffe exhibits a picture which he is pleased to title "The Rake's Progress," a charming study, but it might better be called "Slow Progress of a Hay Rake." The title is distinctly bad. Hogarth's pictures have stamped the "rake" a dissolute fellow, but in Sutcliffe's picture both man and woman are the very quintessence of trusting simplicity. Mr. J. W. Beaufort, a very capable photographer, abuses his power in "Go, thou must play alone, my boy; thy sister is in heaven," a *supposed* death-bed scene, which, in our opinion, is a prostitution of photography, and most revolting. Both Mr. Austin and Mr. Keighley show their well-known genre studies. Mr. B. G. Wilkinson also sends his picture "Prawning." Mr. C. Smerdon Roe contributes several pictures, including "The Old Ferry," which was awarded the AMATEUR PHOTOGRAPHER medal at the Champion Exhibition in Bond Street. Mr. H. P. Robinson exhibits "A Gossip on the Beach," but, like many other good things in the Exhibition, it was passed over by the judges.

Messrs. Green Bros., take the bronze medal for Enlargements, and Mr. T. G. Whaite the silver. Messrs. Faulks and Kitchin send their usual consignment of

pictures, some of which are very good, and have received recognition.

In Cattle Studies, Mr. Austin takes a silver medal with "Cooling Waters," and Mr. R. W. Robinson the bronze with "Suspicious," a very capital picture. No other picture in this class has call for comment.

Prizes were offered for Enlargements on Ilford bromide paper, and the gold medal was awarded to Mr. W. W. Fry for "Cullercoats Bay," a very poorly composed picture, very hard and with but little call for special notice. The gold medal ought not to have been awarded. The silver medal is best deserved by Mr. H. Dudley Arnott's "Somerleyton Hall."

In the class for prints on Alpha Paper, in which there are only five exhibitors, the gold medal is taken by Mr. F. W. Edwards, who sends four frames containing chiefly copies of paintings or engravings. The silver medal is awarded to Mr. Austin for "Rest and Refreshment," "Waiting her Turn," and "Early Spring."

The Amateur Section is extremely poor. Mr. C. Court Cole takes a silver medal in Landscape (half-plate and under), for three charming compositions, but which, in our opinion, is too deeply printed to secure the true values. Mr. J. W. Evans secures the bronze medal with three "Hoar-frost Studies"—old friends, we think, and which have already received distinction.

In Architecture, Mr. C. R. Pancoast takes the silver medal for his views of the Calcutta Exhibition, 1883. The catalogue says this may, of course, be a misprint, but if it is correct, our American friend is harking back a long way to give we poor Englishmen a chance of admiring his photographic ability. Why he should have had the medal at all, except that he is a "stranger," passes our comprehension. Any of the other exhibits are as good, and those sent by Mr. Ernest Beck, and awarded the *bronze* medal, are better.

Mr. Ernest Beck takes a silver medal in the Instantaneous Class for his very beautiful picture "Beating In." Mr. Martin J. Harding sends a frame of his charming hand-camera slides on the "North Wales Coast," and receives a bronze medal. In this class Mr. George Proud sends a well-chosen picture, "Hay-time," Mr. A. W. Gottlieb has several pretty and effective studies, and Mr. W. S. Corder a good picture in "Genoa Harbour."

The class confined to amateur members of the Association, in which the medals awarded are from the AMATEUR PHOTOGRAPHER, must be considered a failure, only eight members entered the competition. The silver medal is awarded to Mr. J. Brown for "View near Mitford," and the bronze medal to Mr. George Proud for three views in Jesmond Dene.

Summing up, we find that at the Exhibition practically all the medals have gone to previously medalled work; that hardly any new work is shown; that in the mixed classes only amateurs who are medallists have competed; and that in the amateur section hardly any amateurs of standing sent pictures.

As a show of photographs, the Newcastle Exhibition is a pronounced success, as advancing photography by the exhibition of new work, it is a distinct failure; for, with the exception of the charming work of Mr. Gibson (Hexham), there is hardly a picture of any merit that has not been exhibited before.

THE DUDLEY ART GALLERY.

In looking through the collection of pictures now being exhibited at the Dudley Art Gallery, a feeling is borne in upon the mind that the photographer has, for some reason or other, more fraternity of sympathy with the water-colour sketcher than with the painter in oils. Perhaps this is because the water-colour artist has greater facilities for rapidly dealing with the infinite moods of Nature's beauty in the very sanctuaries of her presence. However that may be, the photographer will often find himself more in accord with the smaller and more delicate-toned water-colour than with the larger and more assertive oil painting. This is specially true of the Dudley Art Society's work, which consists for the most part of landscapes and similar purely outdoor studies.

Entering the Gallery, we first notice Mr. Fred Burgess' No. 2; this artist is too inclined to ring the changes on the Thames between Batterse and Westminster and the lagoons of Venice, yet, notwithstanding the divergent characteristics of the two subjects, he achieves in both no small measure of success, and it is most instructive to compare No. 2 with No. 30, both carefully thought out subjects. For street treatment, No. 38 is noticeable. No. 7, "A Good Catch," by Miss Kate Macaulay, is a very taking picture; the composition is truthful, and the landed fish in the foreground are excellently well rendered, but its peculiar charm lies in the painting of the sea just underneath the boat's keel, conveying as it does an accurate impression of that clear deepness of colour so noticeable on coasts where there is an abrupt plunge into deep water from a shelving pebble beach. It is, however, a little disappointing to find this clever artist repeating the identical effect in three other sketches (Nos. 156, 160, and 161), so that we begin to think that, after all, it is but a "trick of the brush," and, indeed, to see an artist repeating himself or herself shows a failure to appreciate the fact that the "truths of nature are one eternal change—one infinite variety." Mr. W. H. V. Cobbett is another sinner in this respect, for there is at least one duplicate here of a Venetian sketch which has already been shown in the Gallery of the Royal Society of British Artists. We will hope that this exhibition of the same work at different galleries is not a lesson that painters have learnt from certain of our successful artist-photographers, and, for the advantage of both, we would quote the words of one who on art matters is universally regarded as an authority; he says, "All repetition is degradation of the art; it reduces it from head-work to hand-work, and indicates something like a persuasion on the part of the artist that nature is exhaustible, or art perfectible; perhaps even by him exhausted and perfected. All copyists are contemptible, but the copyist of himself the most so, for he has the worst original."

We cannot help feeling vexed at the treatment of the interior of St. Stephen's Church, Walbrook (No. 40); the rendering of the columns in the foreground is very clumsy, and the perspective defective. No. 58 is another crooked architectural piece. There seems to us no excuse for artists being guilty of such errors.

Mr. Nibb's pictures (Nos. 11, 31, 66, and 129) show a great similarity of colour treatment, so much so that they become slightly monotonous, and convey the impression that the artist is inclined to render Nature as he thinks she *ought* to look. There is a point beyond which individuality should not go, and that point is reached when

personal idiosyncrasy begins to interfere with truthfulness.

There are a considerable number of pictures of Dutch scenery exhibited. The canals, quays, and barges of Holland afford much scope for artistic treatment, and by photographers have not yet been much utilised; it is a country so easily accessible that many an amateur with a fortnight's holiday, and with Percy Lindley's handy little book "Walks in Holland" in his pocket, might procure a series of delightful little "bits" of Amsterdam, Dordrecht, and the dead cities of the Zuyder Zee, besides educating his artistic taste by a study of the Old Masters at the Hague Gallery.

Mr. Rupert Stevens' "Lazy Scheldt" (170) gives a good notion of the charms of Dutch waterways. It is easy to imagine the artist, sitting in one of the slowly-moving barges, painting those that follow in its wake as they idly drift down-stream. No. 94, "By the River," is a splendid piece of water-colour painting, very different in character indeed from No. 170, but carrying the same subtle conviction of truthfulness. No. 121 is also good, and it is interesting to compare it with 219, and note the different methods of the two artists in the treatment of similar scenes.

Mr. O'Brien is the President of the Royal Canadian Academy. He has sent some fine sketches of North American scenery. Nos. 52, 27, and 74 are all worth studying. In No. 226 there seems something wrong with the perspective; the ship and the tug that are making their way into the harbour seem far too small, considering the distance they appear to be from the spectator.

Of sea pieces, No. 76, "Mid Channel," by Mr. Aldridge, is full of life; but Mr. David Green, a rising young artist, exhibits something better in No. 147, a fine bit of sea-painting. No. 118, by the same artist, shows his versatility. No. 212, "Night's Shadows Falling," by Miss Helen O'Hara, is a most creditable piece of work, showing angry waves beating in foam against the shore; the introduction of a piece of broken breakwater tells its own tale, and the rendering of the sky is not less successful than the lighting of the sea in conveying the idea expressed in the title.

The President (Mr. Walter Severn) shows three thoroughly good pictures, Nos. 163, 134, and 331. In the first he has well realised the clear, bright atmosphere of the Riviera, and in 331 the painting of the clouds on the hillside is admirable.

Mr. Fullwood has original ideas as to colouring; his best pieces are Nos. 120 and 122. To those who know the lovely valley of Saas Fee, No. 303, by Rev. T. N. Rowsell, will seem cramped.

Mr. Coleridge has some minute and delicately finished sketches, but they suggest Christmas cards. There are one or two Indian pictures, but they are not successful, No. 267, for instance, being most unnatural.

There are very few portraits or figure studies. No. 9 is an unusually large piece of water-colour painting, and is more or less satisfactory. No. 151 is a realistic rendering of an Arab's head, and No. 52 is a charming figure study.

In this collection, then, there is much that is interesting in scenes from many lands. There is much that is instructive, and very little that is really bad art—or rather, not art at all—and if there is too much dead level, and too little originality, at any rate we can say with the poet there's

"Little that's great—but much of what is clever."

SUMMARY OF THE LIVERPOOL (1891) EXHIBITION CONDITIONS.

THE issue of the terms and conditions of the Liverpool International Photographic (1891) Exhibition has given general satisfaction. We have published on two or three occasions, in previous numbers of the AMATEUR PHOTOGRAPHER, forecasts of the Exhibition scheme; we are now in a position to add further particulars. The show will, of course, be run under the auspices of the Liverpool Amateur Photographic Association, the medium being the Walker Art Gallery, where a set of superb rooms will be at the command of the promoters of the exhibition. Friday, 6th March, 1891, is the day of opening, and Saturday, 4th April, the day of closing. Applications for space—printed forms provided—must be made not later than 20th January, to be accompanied with 5s. entrance fee, which will cover any number of frames not exceeding ten; each additional ten or part of ten, 5s. extra. Minimum charge in all cases, except for lantern and stereoscopic slides, 5s. Lantern slides for competition must be sent in duplicate; one set for exhibition, the other to be used on the screen. The entrance fee is 1s. per duplicate set of six lantern slides or six stereoscopic slides. For trade exhibits, purely for exhibition, and for which there will be no awards nor restriction as to production, a special section is assigned; the entrance fee is £3 3s. For lantern slides, in frames provided by exhibitors in this class, not exceeding four frames, each containing twenty-four slides, the entrance fee is 10s. There will be no charge for wall space in any section. All pictures and exhibits must be delivered at the Walker Art Gallery, Liverpool, not earlier than 2nd February, nor later than 17th February.

These details, taken in conjunction with others we have already made public, will give a general idea of what the forthcoming Exhibition purports to be. The list of classes and awards embraces many features of novelty and interest, and would monopolise too much of our space to give in its entirety, but we may broadly summarise it. In all there are nearly thirty classes, covering exhibits under the heads of portrait, landscape, marine, cloud, animal, group, architectural, scientific, genre, enlargement, stereoscopic, lantern slide, hand-camera, and instantaneous work. Two prizes, one for ladies and the other for beginners, youths under twenty years of age, will be given by the President of the Liverpool Association, Mr. Paul Lange, and there will also be a challenge competition between photographic associations, and a champion class competition. We need scarcely say that the scheme offers many advantages. The specific understanding that amateur and professional workers will not compete in the same class, that exhibits must be declared to be the entire work in every particular of the exhibitor, that the name of the exhibitor and title of the exhibit must appear plainly on the front of the picture, mount, or frame, and that, except in the Champion Class, no pictures shall be allowed to compete which have been previously exhibited in public competition in the United Kingdom, exception being made only in favour of the Photographic Society of Great Britain's 1890 Pall Mall Exhibition, and private exhibitions confined to members of photographic associations, cannot fail to meet with approbation. Other stipulations regarding framing, foreign exhibits, adjudicating, number of awards,

prize pictures, etc., are equally commendable. We have no doubt whatever that the show, altogether, will prove more successful than even the previous great show in Liverpool in 1888.

Letters to the Editor.

THE CHALLENGE CUP.

SIR,—The Newcastle exhibitors complained that some of their pictures were excluded from the Challenge Cup Competition, and I thereupon immediately checked off, by their list and the catalogue, every picture as hung in the three alcoves set apart for them.

Not one was missing, but in addition two of those which had been previously shown at the Crystal Palace were included.

As, however, no mention of the disqualification of those two, or of any others, was made to a single judge, it is not easy to see how the presence of two additional pictures was prejudicial to the interests of the Newcastle Society. The entire number of the Newcastle pictures (Mr. Sawyer having substituted two new for two old ones) were submitted to the judges for their consideration, and the responsibility of the executive was then and there brought to an end.—Yours truly,
J. F. PEASGOOD.

Crystal Palace, April 26th, 1890.

* * * *

DISTRICT EDITORS.

SIR,—At first sight there seems to be a good deal in favour of the views of "A Vice-President," that local Press-men should be appointed to act as district editors, because they would be more impartial than would members chosen from the local photographic societies.

But on further consideration it seems open to discussion whether there would be a balance of advantage in favour of the journalist, for the following reasons:—

(1) He is less likely to grasp the salient points, or to properly appreciate the various technicalities involved.

(2) There is no valid reason why he would be more impartial than anyone else. Is a Radical reporter always impartial in what he writes about "Primrosers"? The journalist, as a regular attendant at the meetings of a society, would be treated as a *persona gratissima*, his good opinion "cultivated," and temptation offered him to write up those who gain his ear.

(3) A Press-man, acting as reporter as well as editor, would require a substantial honorarium.

On the other hand, in favour of appointing a member of the local society, it may be urged—

(1) The member will be familiar with the subjects he has to report, and, as an active worker, will have opportunities of hearing local photographic news denied to the journalist.

(2) There is no reason to suppose he would be less fair than the journalist. In the first place his reports would be open to the criticism of his fellow members; and the executive of his society would certainly use their legitimate influence to ensure his impartiality. Secondly, any unfairness could be intimated to you; the knowledge of which would be a sufficient deterrent for most men.

(3) The remuneration required would be nominal.

It is to be observed that the sense of responsibility in a district editor would be far greater than it is in the case of a quasi-anonymous reporter.

There is, however, one circumstance under which it would be better not to appoint a member of a local society, *i.e.*, where there are two or more rival societies in a district.

As this is the case in my own district, I, in conformity with the above opinion, beg to withdraw my name as candidate for the post of district editor.—Believe me, yours very faithfully,

A PRESIDENT.

* * * *

CHEAP LENS.

SIR,—I notice in your issue of 18th inst. that Mr. G. Davis seeks to cast some kind of reflection on the remarks I made in my paper on "Hand-Cameras" in the PHOTOGRAPHIC SOCIETIES' REPORTER for March 31st, that, namely, some of the Kodak cameras have only a sixpenny lens, with which it is possible to do some very

Good enlargements. I do not know whether Mr. Davis challenges my facts; if so, he may be assured on this point by referring to the Eastman Company, who will also most likely show him the enlargements I speak of. I may add that I do not assert in my paper that these enlargements are the "best" that may be got by any lens, nor do I advocate exclusively, or even at all, the use of such lenses, as a reference to my context will show. Mr. Davis's would-be strictures are, therefore, irrelevant, if not, indeed, fractious, and I can only confirm my statements in the article in question.

Apologising for troubling you at this length, I am, etc.,

April 22nd, 1890.

F. T. NORRIS.

* * * *

F. D. BULMER.

SIR,—We thank you very much for sending us Mr. Bulmer's estimate, which is the first we have seen of the kind.

We beg to say that the lens referred to cannot be obtained from us at the terms named, that Mr. Bulmer has no business credit with us, and that we have already declined to do business with him.

We shall be glad if you will inform your customer of this matter.

We return the estimate with best thanks.—Yours faithfully,
April 22nd, 1890. TAYLOR, TAYLOR, AND HOBSON.

DOCUMENT SENT TO MESSRS. TAYLOR, TAYLOR, AND HOBSON.

"We beg to say that we can supply you with a new Taylor, Taylor, and Hobson 6½ by 4½ R.R. lens, 7 in. focus, for £2 7s. 6d. complete, as per list at £3, delivered direct from the makers, upon a week's approval; guaranteed the latest make and all new improvements up to date. Kindly let this have your consideration; you can rely upon prompt attention being given to all commands.

"April 18th, 1890.

(Signed) F. D. BULMER."

* * * *

YELLOW CALICO v. RUBY GLASS.

SIR,—In answer to "Experience" I can only say, as far as my own experience goes, I always use *yellow calico* in the window of my dark-room; if the light is very bright, generally two thicknesses, only using a ruby lamp at night. I have never found the yellow light fog and much prefer it to the ruby, as it does not try the eyes nearly so much. It is certainly used more in the dark-rooms of professionals, who often have both, only using the ruby over the yellow when the sun is actually streaming on the window.—Yours faithfully,

WENTWORTH A. J. CROKE.

April 28th, 1890.

* * * *

THE ILFORD SCHOLARSHIP.

SIR,—Will you allow me as an amateur photographer of many years' standing, and as one who has taken an interest in the popularising of photographic science, to express to Mr. Howson the regret which I, in common, I am sure, with many others, feel that neither of our leading societies have thought well to take up the responsibility of administering his generous offer, and at the same time to venture to make to him a suggestion which, if he accepts it, will enable the Britannia Company's munificent gift to "benefit the art-science" quite as much as it could have done had it been taken up by a society.

My suggestion is that he should offer the amount as a scholarship to the City and Guilds of London Institute. This body is, as far as I am aware, the only one which holds regular examinations in the art-science, and which, by its grants to teachers, and its awards of silver and bronze medals and prizes for the last ten years or so, has already done much to encourage amongst photographic students the study of the scientific basis of their art.

Let Mr. Howson offer it to the candidate who this year gains first place, and he can specify as a condition that he should utilise it either by attending classes in the higher branches of his science, or improve his art knowledge by entering an art school or the studio of some leading photographer. Thus one student, who must possess a sound knowledge of his subject, will be encouraged, and the knowledge that such a scholarship will annually be offered will attract a much larger number of photographic students to take up their subject scientifically.

Neither I nor anyone else outside the Institute can possibly

know who has entered; still less who will be most successful at the examination, which, I believe, takes place this year on Wednesday, April 30th, and therefore the offer this year cannot affect the number of entrants, nor can I have any personal object to gain, whilst the fact that Captain Abney, F.R.S., is the examiner will stamp the examination as perfectly impartial, and its result as a sound guarantee of sufficient merit. If Mr. Howson entertains my suggestion, and would care further to know my views on the most feasible arrangements and conditions, I shall be most pleased to communicate with him privately or otherwise, and you, sir, have my address.—I am, etc.,

SILVER MEDALLIST OF CITY AND GUILDS INSTITUTE.

The Complete Photographer;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

By H. P. ROBINSON.

CHAPTER IX.

Development (continued.)

PHOTOGRAPHER.—We will now develop one of the three plates we have exposed. For this we shall require a tray or dish. The selection of this dish is of some importance; many varieties are made for the purpose, few of which are efficient. Some of them are very elaborate, set up on stands, provided with a trough for the developer, made to rock like a cradle, and have transparent bottoms. You may take it that inefficiency in this case, as in many others, is in direct proportion to complications. A solid glass dish would be clean and competent, if a well-made one could be got, but they are usually so warped that your plate will not lie flat in them, necessitating a much larger quantity of solution. Papier-maché trays have usually a similar fault, they bulge up in the middle. Thin ebonite trays, with ridges at the bottom, are good for small sizes, but for larger plates they soon come to pieces, and you find they are made of brown paper with a thin skin of ebonite. On the whole, I prefer solid ebonite trays. These err a little on the other side, and the bottoms are so truly flat that it is difficult to remove the plate from the solution for examination. This can be remedied by laying a thin string under the plate, or dropping three or four small patches of sealing-wax on the bottom.

We exposed three plates on the same subject, and will begin with the one we judge to have been correctly exposed—the two seconds one. As a rule, the technically best negative is the product of right exposure, developed with the normal developer, without any dodging.

PUPIL.—What is "dodging"?

PHOTOGRAPHER.—I mean that the technically best negative is the result of the simplest development. A plate that is so far from rightly exposed as to call for all your skill to make a negative of it, is not likely to be so good, although it may please you better because you have had to nurse it so tenderly.

We mix our developer as I have already described; that is, we take 3 ozs. of water in a measure, to which we add 60 minims of the pyro solution (A) and the same quantity of ammonia and bromide (B). We then place the plate in the dish and pour on the developer. Now watch the result. In a few seconds the image appears, and gradually grows, and I can see that it is coming rightly. Our object is now to continue the development until the image assumes the right intensity. It requires considerable experience to know when this is done, for the thickness of the film makes it difficult to judge, and this is where inexperience often

fails. However, something may be done. We will lift the plate from the tray, and hold it between our eyes and the orange light, taking care to keep it moving laterally to prevent the developer running in streaks and causing lines in a downward direction. It probably now appears to you to be a blank mass of density, without much appearance of image, but to my more experienced eye it is still too thin, so we will continue the development. The sky and other bright objects are now seen to be coming darker, and in about three minutes from the commencement I judge it is done, and we shall have a good negative. Different makers' plates vary considerably in the time they take to develop, but these we are using come up rapidly. We now wash the negative under a good stream of water, and it is ready for fixing. With some plates, especially in warm weather, it is necessary to place the negative at this stage in a saturated solution of alum to prevent frilling (an expansion of the film) at the edges, but the ones we are using will not require that treatment. The plate is now placed in a solution of hyposulphite of soda—4 or 5 ozs. to the pint of water; the proportion is not very material—to dissolve the unaltered bromide of silver. You may keep the hypo dish outside the dark-room, for if well washed a weak light will not do the negative any practical injury, although I hear that theoretically it is most pernicious—which is no great matter. It must remain in the hypo not only until the milk-coloured bromide is apparently removed, but at least a quarter of an hour longer. The reason for this is that there is an invisible chemical compound, which, if not removed, will in time turn brown and ruin the negative. When I have a negative that I greatly care for, I take the precaution to give it a second bath of fresh hypo.

PUPIL.—What is this invisible chemical compound; has it a name?

PHOTOGRAPHER.—Now you are becoming inquisitive. It is not within our contract but I will satisfy you once for all in the clear language of science. The further reaction in the fixing-bath consists of the union of two molecules of the compound AgNaS_2O_3 with one molecule of sodium thio-sulphite (vulgarly called hypo), producing the soluble salt $\text{Ag}_2\text{Na}_4\text{S}_2\text{O}_5$

PUPIL.—Thank you! I am grateful and contented for ever. Pray proceed on the old lines.

PHOTOGRAPHER.—The negative must now be well washed in running water—or, if that cannot be had, in water often changed—for at least an hour. We need not wait for that, but will give it a slight rinse and examine it.

PUPIL.—What is the right intensity of a negative?

PHOTOGRAPHER.—That which in the print shows the nearest truth to the tones and gradations of the scene represented. Let it be a "sparkling" negative if the scene is sparkling, and dull if the scene is dull. I prefer the thinnest negative that can be made, without omitting any of the gradations between light and dark, especially for platinotype printing. For silver printing I have always been heterodox enough to think a *very* slightly fogged negative gave the best atmospheric effect, and I think little of a landscape photograph that does not show air and space.

Looking through our negative by transmitted light, we find that the darks, in very minute quantities, are represented by clear, or nearly clear, glass, and the high lights, also in extremely small quantities, are nearly opaque, and the rest of the negative, including the sky, is made up of half tones and gradations ranging from the highest lights to the deepest darks, and that the whole has proper printing density, a quality which you will only learn from much ex-

perience. Too thin a negative would give a flat print with loss of gradation, while too intense an image would give a print of the soot and white-wash order.

We will now take the plate that we know was under-exposed. For this we shall require to start with less of the pyro solution and more of the ammonia, which, with careful treatment, will produce nearly as good a negative as the other, as you will soon see. . . . The excess of ammonia has produced a slight film over the clear portions we do not find in the first negative, neither do the gradations come out with quite the satisfactory harmony of a properly exposed plate; it will make a good print nevertheless. The third plate, which was much over-exposed—five seconds as against two, which was correct—will take more careful treatment. We know it is over-exposed, and can therefore provide for the difficulty at the outset. The case of an unknown exposure we will take presently. We mix our developer thus:—Water 3 ozs., pyro (A) 60 minims, ammonia (B) 20 minims, and bromide solution 3 or 4 minims. Notice the difference in proportion and the additional restrainer. You see that the image comes out much more slowly than the first plate, and we must have patience. If it came out more quickly, I should add more bromide. Now, after ten minutes, it appears to be nearly done, but it is still thin and weak. Some photographers would continue the developer for a very long time, but I see no advantage in this, but prefer to act as follows:—I drop a few minims of ammonia solution (B)—say, for precision, 10—into the measure, add the same quantity of bromide, and pour the developer into it, and return it to the plate in the tray. You now see that the image at once slightly darkens, and the development is finished. This darkening of the image on the addition of ammonia and bromide is the effect to which I alluded in our last conversation. It is often the practice, when density is desired, to add pyrogallic acid; this is a mistake, there is enough pyro in the formula to produce any reasonable intensity, but it must be incited to further action with restrained ammonia. The three negatives are now developed. If you saw prints from each plate side by side, you would have difficulty in saying which was which.

PUPIL.—Now for the case of the plate that has had an unknown exposure, which, I apprehend, is what I shall often meet with.

PHOTOGRAPHER.—The treatment here to begin with is nearly the same as the last, omitting the bromide solution: Water 3 ozs., pyro (A) 60 minims, ammonia (B) 20 minims. This is intended as a feeler. If the image rushes out instantly, pour off the developer, and flood the plate with water. If there is not time to save the developer, at any rate lose no time in turning on the water. Then proceed as for an over-exposed plate. If, on the other hand, the image hesitates unusually, and shows signs of under-exposure, add the rest of the ammonia solution to make the developer up to the normal strength, and if that does not do, proceed as already directed for a plate of this character.

I have now shown you how to treat three degrees of exposure and the unknown, and must leave you to attain certainty by continual practice, for nothing but experience, and comparing your results with negatives of known excellence, can teach you. It would also be of value to show to an expert what you have done, and to take his advice—if you can find one of an amiable temperament, who also rather likes being bored.

PUPIL.—I must come to you!

PHOTOGRAPHER.—But if your negative does not turn out of the right intensity at first, it is probably not lost. There is much salvation in reduction and intensification, a subject we will go into at our next meeting. We have not, however, done with the negative yet. It must wash for at least

an hour, as I have said, and then you will probably find it has a very slight brown colour, which would retard the printing if left in the film. This must be removed. Take a saturated solution of alum, 40 ozs., to which add half an ounce of hydrochloric acid. Place the plate in this for a minute, and you will see a great improvement. The brown colour will give way to that delightful grey which is always seen in a good technical negative. Another hour's washing will complete the operation, when the negative may be placed in a rack to dry.

We have still that unfortunate plate which we left so unreasonable a time in the camera, with the shutter withdrawn, before exposing. Throw a little developer over it that you may see the result. It is a negative, but the image is badly fogged.

(To be continued.)

The Electric Light and Photography.—II.

By T. C. HEPWORTH, F.C.S.

LIGHT BY INCANDESCENCE.

It is always an interesting operation to trace the gradual evolution of any particular invention. First we have the germ, in the form of an idea which, perhaps by accident, was born of the brain of the pioneer worker; and then we see how this infantile idea gradually grows, fostered by others, until it attains full growth and becomes serviceable to mankind. The incandescent system of electric lighting, which is even now so extensively used for interior illumination, found its germ in the patent specification of E. A. King, to which I have already referred; and to show how like in principle this invention of 1845 is to our modern system, I annex a sketch of King's lamp, which I have copied from his specification, and I quote the description accompanying it:—

"A is glass tube, similar to those used for barometers, except that it has its upper end enlarged into a cylindrical bulb, and a stout platinum wire sealed in at the top. A binding screw is fixed on the top of the wire, whose lower end screws in the iron piece D. To this piece the forceps F are attached, and it is connected with a similar piece at H by the porcelain rod T. The forceps G are attached to H, and clamp the lower end of the carbon piece (C), which has its upper end held by those at F. N is a copper wire, which is fixed in the piece at H, and extends to the bottom of the tube. The tube is filled with mercury, in the same manner as a barometer, the usual precautions being taken to expel the air; its length, independent of the bulb, should be about 30 inches, so that when it is inserted in a cup of mercury a vacuum will be formed in the bulb. The instrument is included in the electric circuit by connecting one of the wires from a magnetic machine or voltaic battery with the binding screw fixed on the wire E, and the other with a wire which passes into the mercury in the cup at the bottom of the tube."

It will be seen from the above description and diagram that King's incandescent lamp is the same in principle as

those of modern times. A strip of carbon is contained in a vacuum, and is brought to incandescence by the resistance which it affords to the passage of an electric current. But the rough carbon then obtainable would at the most only hold together for a few hours, and the device to obtain a vacuum by means of a 30 inch column of mercury was cumbersome, and expensive enough to limit the lamp to experimental uses only.

In the following year Greener and Staite patented a lamp which really represents the same idea as King's with the parts differently arranged. The mercury column also disappears, and we may presume that the inventor intended to exhaust the globe of air by means of a pump. In this design we are certainly brought nearer to the modern glow-lamp, but the thick stick of carbon which is placed between the electrodes is very different to the hair-like filament which is now used for the same purpose. Putting other considerations aside, it is certain that the comparatively large pieces of carbon used in these first lamps would require a very powerful current to bring them to an incandescent state. Greener and Staite's patent specification is worthy of further notice, because it includes sundry processes for the preparation of a finer description of carbon than that afforded by the gas retorts, and here we certainly have an important step in a forward direction.

The incandescent form of electric lighting seems to have now been put aside for a time, but in 1871 it was again revived, and strangely enough in a country which we do not usually associate with much advancement of any kind. It was in Russia that this system, in the year 1871, received what may be described as its first public trial. In this year M. Lodyghin showed two hundred incandescent lamps lighted on one circuit—the current being derived from an Alliance machine—of which more hereafter. We read that this experiment, which was successful in every way—for the short period which it covered, be it observed—made so great a sensation that all other forms of artificial illumination were looked upon as doomed. A Company was formed, and the inventor was somewhat prematurely rewarded by a sum of 50,000 roubles from the Academy of Science. But after a short time the excitement died a natural death, and the Russians had to return once more to lamps and candles. I have no knowledge of the exact form which these lamps assumed; but fig. 2 shows one which was invented in 1872 by Konn, another Russian.

This lamp contains a rod of graphite as the incandescent material, and the globe, instead of being exhausted of air, was "hermetically closed and filled with nitrogen, or other gas that does not support combustion." In the description of this patent, we have evidence that the inventor was aware that the carbon was perishable, for he provides a means by which the current, when one strip of graphite became spent, could be switched off to a second and subsequently to a third strip.

It would be tedious to quote the various lamps of this kind which have been invented and reinvented during the past twenty years. They are interesting only historically, and as links in the chain which led up to the modern glow-lamp, the gradual perfecting of which we owe to the researches of Edison, Swan, Maxim, and others.

It is interesting to look back to the time, ten years ago,

FIG. 1.

FIG. 2.

when the news of Edison's discovery of the glow-lamp was first made public by one of those sanguine telegrams from New York which so frightened the shareholders in our gas companies. This telegram told us that Edison had perfected an electric lamp of extraordinary simplicity, costing only twenty-five cents, and that he was going to illuminate Menlo Park by its aid; that he had discovered that a steady, brilliant light could be obtained by the incandescence of mere carbonised paper better than from any known substance. Strips of drawing paper in horseshoe form were placed in a mould and baked at a very high temperature, and their charred residuum was then attached to platinum wires which were hermetically sealed in a glass globe from which the air was exhausted. This, attached to a wooden stand, or ordinary gas fixture, was the whole lamp. About the same time as this wonderful paragraph appeared in the papers, I remember that a lamp was brought out in London and sold for one shilling. It professed to be a perfectly efficient electric lamp, and consisted of a glass tube with a small piece of carbon pencil fixed between two wires in its interior. I have no doubt that this contrivance had an enormous sale—for it appeared to be complete in itself—and was certainly cheap. The cunning inventor, however, left the purchaser to find out that attachment to some generator of electricity was necessary before it would give light. We can trace the likeness to the modern glow-lamp in the above description of Edison's 25 cent. arrangement, the most noticeable point of difference being the use of a hair-like fibre of carbonised bamboo instead of the charred cardboard. Mr. Swan, in England—whose name is familiar to every photographer—had before this used a parchmented thread for the same purpose, and this is still in use. We shall presently see how in various forms the glow-lamp is being employed for photographic purposes.

(To be continued.)

The Stereoscope.—I.

BY VALENTINE BLANCHARD.

SURELY, in these latter days of this most wonderful century of invention, when photography—which was in a most nebulous form at its commencement, and only took practical shape when its first half was nearly expended—is practised in some way or other by almost every third person one knows, the time has come for the resurrection of that practically long-buried instrument, the stereoscope.

To live in such an age, however, is a blessing not entirely without alloy, for we all know so much about so many things that we are quite *blasé*, and it is difficult to arouse anything approaching the enthusiasm displayed by the early workers in any of the arts, and particularly in that of photography. It is true there are more cameras at work doing *something* than at any other period in the history of the art, but the enthusiastic amateur who made his own cameras, and occasionally even ground his own lenses, but who most certainly printed, mounted, and entirely finished his own pictures, is now distinguished by his rarity.

Let us hope, however, that the enthusiasm we speak of is not entirely extinct; and the object of the following papers is to try and awaken enthusiasm for that almost obsolete instrument, the stereoscope.

So completely is it a thing of the past that when mentioned to modern amateurs the frequent answer will be, "Ah, yes, I remember we had one when I was young, but I don't know what became of it, for I have not seen it for years. I think the glasses came out, or something or other happened to it; at any rate, it disappeared."

The discussion a short time ago ably carried on by Andrew Pringle on one side, in answer to an astounding statement made by some one, that two copies of the same negative mounted side by side and viewed through the stereoscope would give exactly the same effect as pictures specially taken at different angles by a twin-lens camera, for the stereoscope—and produce equally well, in fact, stereoscopic relief—shows the necessity of going into the subject completely; and therefore those who may find in the following articles much that is stale, flat, and unprofitable must remember that the best method of teaching is to assume the pupil has complete ignorance of the subject, and start with the A B C.

The history of the stereoscope is absolutely necessary to the modern photographic amateur, for he can form no idea, seeing it as he does in its present forlorn and neglected condition, what a position it once occupied in every cultivated home. The family album really deposed it, but perhaps even at the zenith of this later craze it never furnished so completely all-round conversation as did the now half-forgotten favourite of a former day.

The fact that each eye sees its own picture, and that by some occult process difficult to explain the brain received the impression of one picture only, has furnished speculation for the philosopher for 2,000 years, beginning with Euclid and ending with Brewster; but to Wheatstone is due the bringing to a focus, as it were, the nebulous material collected from the dust of ages, and giving a practical and tangible form to it all, in his reflecting stereoscope.

Sir David Brewster, to whom we owe the portable form of stereoscope now known all over the world, appears, in several of his contributions, jealous of the discovery of the principle of stereoscopic relief by Wheatstone, and endeavours to make out that it was known by Jacopi Chimenti in 1593, and that he drew pictures in pairs. One of these twin drawings is in the museum of Lille, and in consequence of much speculation about it, a photograph of it was made by Bingham, and a copy sent to the Prince Consort, but, in spite of Brewster's assertion, who maintained that several persons who saw the pictures found they gave something approaching stereoscopic relief, the weight of the evidence was against him, Bingham, among others, announcing that there was no relief whatever. Brewster asserted also that some years before the exhibition of the first reflecting stereoscope by Wheatstone, some one in Edinburgh was busy with investigations about the same time. It is evident that Brewster regarded Wheatstone as one of those ancients who steal all our best and most original ideas, and did all he could to lessen the importance of the great discovery. But in spite of all he has written about the labours of others, the stereoscope owes its origin entirely to the experimental researches of Sir Charles Wheatstone on binocular vision.

The following passage from Mayo's "Outlines of Human Physiology," p. 288, published in 1833, is the first clear explanation of the principle on which it is constructed:—"A solid object being so placed as to be regarded by both eyes, projects a different perspective figure on each retina; now, if these two perspectives be actually copied on paper, and presented one to each eye so as to fall on corresponding parts, the original solid figure will be apparently reproduced in such a manner that no effort of the imagination can make it appear as a representation on a plane surface." Sir Charles Wheatstone's "Contributions to the Physiology of Vision (Part I.)," appeared in the "Philosophical Transactions" of 1838, but this paper was the result of investigations extending over a period of years, and there is evidence that reflecting stereoscopes were constructed for Wheatstone by Newman, a well-known philosophical instru-

ment maker, as early as the year 1832. Wheatstone, no doubt, also as early as 1845, employed photographic pictures for his reflecting stereoscope.

Sir David Brewster took up the subject, and in two papers read by him before the Royal Society of Edinburgh, in January, 1843, and April, 1844, gave the result of his researches. Further experiment finally led to the invention of the Lenticular or Refracting Stereoscope—the modern instrument, in fact, which has survived as the fittest. His first instrument was exhibited at a meeting of the British Association in Birmingham, in 1849. A more perfect instrument was made for him by Mr. Laudon, of Dundee, and shown to the Abbé Maigno in 1850. Dubosc, a Parisian optician, took up the manufacture, and of the first one made by him, the Abbé Maigno says, "It is constructed with more elegance and even with more perfection than the original instrument."

In his article on the "Stereoscope" for the "Encyclopedia Britannica," Brewster says that "on December 30th, in 1850, Dubosc exhibited the lenticular stereoscope to the Imperial Institute of France, and a committee of eminent men, whose names need not be given here, was appointed to examine it. Again we have the old, old story, a prophet hath no honour in his own country. It needed a journey to France, and honour and glory there, to make the stereoscope a popular instrument in the land of its birth; and with some bitterness, further on in the same article, Brewster says, "Although Sir David Brewster offered the free use of his invention to the opticians of London and Birmingham, in 1849, yet not a single instrument was made by English artists, and it was not till a year after its introduction into France that it was publicly exhibited in England."

The regular manufacture of stereoscopes was commenced by Messrs. Soleil and Dubosc—the first a good name, by the way, for the maker of an instrument for the exhibition of sun-pictures—and still-life groups, such as vases of flowers, statuettes, objects of natural history, etc., were employed by them to show the wonders of the new instrument. At the great exhibition of 1851 some beautiful daguerreotype pictures were shown by them in one of their new instruments, and became the talk of all London. These pictures attracted the attention of the Queen, and before the Crystal Palace was closed one of Dubosc's instruments with a set of slides was presented, in the artist's name, to her Majesty by Sir David Brewster.

Looking back to this period, it is not at all surprising to see the French so far ahead of us in the manufacture of stereoscopic slides, for the daguerreotype process—"free to all the world as the sunlight that gave birth to it," as was said by Arago in announcing the pension given to Daguerre, for his discovery—had been patented in England by the latter, who evidently was by no means a bad man of business and said nothing about it until after the award of the pension. It naturally followed that the free use of the daguerreotype process for some years before it became free in England advanced the quality of the French productions over those of the English, and gave to the Parisian photographers a distinct start in the production of stereoscopic slides.

It is interesting to note that the year of the great exhibition gave to the world the Brewster instrument in a commercial and workable form, and the collodion process which gave it its world-wide popularity, for, beautiful as were the daguerreotype slides, they could only be produced slowly one by one in the camera, whilst the ready means of multiplication furnished by Archer's method soon spread the wonders of the new instrument broadcast over the globe.

(To be continued.)

Camera and Canvas Shake Hands.

BY THE PRESIDENT OF THE CROYDON CAMERA CLUB.

MANY of us remember the confident predictions of a quarter of a century back, viz., that the sun picture would drive the brush picture off the face of the earth, and the time was at hand when the followers of Raphael or Turner would vanish into obscurity.

At the time referred to, the realistic painters had not routed the "conventionals," nor had the British barbarian been sufficiently educated to recognise the most superficial defects in works of art; much less was he able to feel any sympathy with the beautiful or intellectual attributes of art *in excelsis*. Nevertheless, amateurs were beginning to sicken of landscapes which had no more local individuality than has a Chinese drawing on a hand screen; landscapes in which the various trees were mechanically painted according to a pattern generally evolved from the artist's inner consciousness, but in all cases more in the nature of hieroglyphics than facsimiles.

What more natural than to think that photography would, almost at a bound, bring about the much needed revolution, and be ever after the chief rabbi of high but realistic art? We latter-day people can quite understand that such views seemed, at that period, by no means oversanguine.

But, alas! how has this flattering tale been marred by the hand of time and the light of experience. Photography is found to be neither realistic nor artistic.

George Washington could not tell a lie, but the sun can and does *every* time it speaks to the sensitised silver. Workers have long ago found out so much; but what they have been more slow to discover is that, broadly speaking, photography is inartistic. Splendid and graphic views are produced bristling with every detail which nature can print, but wanting a soul. They may be likened to an Apollo who is at the same time an idiot. In my mind's eye I have certain exceptions; but they are so few as to be but as drops in the ocean, and only by contrast heighten the dismal effect of the mindless mediocrities which we have all too often seen.

Why is this so? Because from the beginning the artist has shrunk from any association with the photographer, and both have ever since carried on an internecine war. True it is that artists now use photography most extensively in building up their pictures; but they do so by stealth, and in fear and trembling.

Again, many photographers, confounding two opposites, believe that nature is art, and that the camera only requires feeding with views in order to reward the owner with works of art. Somehow this has not usually happened: that it was not likely to, was always apparent to workers with the brush. But since, in consequence of the great improvements in apparatus and processes, it has become quite common for almost anyone to produce sharp and "brilliant" negatives, the all-round lack of artistic merit has become more self-evident. So much is this the case that certain photographers have hit upon the ludicrous expedient of cultivating "fuzziness" in their prints. They seek salvation in dim obscurity, and believe that to be the gospel of art. If so, then is Meissonier among the lost.

But others, who are verily the apostles of truth, have at last grasped the fact that photography cannot thrive unless she be wedded to art; this doctrine they are now disseminating, both by precept and practice, with a vigour which bids fair to produce important results. At the same

time such of us as have studied art cannot but know that photographers, as a body, have a tough task before them. The manipulative part of photography can be learnt in, say, six weeks; as many years may pass without the student acquiring an art education.

It is, therefore, passing strange to hear some of the enthusiasts who have received the truth, talk of studying art for a few months with a view of qualifying themselves for the new departure. They have been talking prose all their lives without knowing it; now, heigh presto! they will talk nothing but poetry. They imagine that by cultivating a *hortus siccus*, by collecting the dry sticks of "artistic composition," they can manufacture works of art. As well expect to write poetry by learning rules of rhyme and rhythm! That photography is at times capable of highly artistic results, I have already said. In order that the exception may become the rule, what we photographers collectively want is the active help of *ready-made* artists; of men who have for years worshipped at the shrine of Art, and learnt from her divine lips how to combine humanity and nature, how to give the realistic a soul, how to turn a topographical scene into a pictorial poem.

Experiments with the Optical Lantern.

By THOS. FLETCHER, F.C.S.

THIS paper was read before the members of the Warrington Literary and Philosophical Society, and we have pleasure in giving the following extracts:—

You are no doubt all familiar with the ordinary arrangement for showing slides, which consists of a source of light, which should be as small and intense as possible, a condensing lens which is made of two plano convex lenses to collect the light, and the objective, which also has two separate lenses used to focus the image on the screen. The lens of the condenser nearest the light collects the rays and throws them in a parallel beam, the other lens collects this beam and concentrates it on the objective. If we unscrew the outer lens and remove it to any distance, we have in the space a parallel beam of light which we can reflect and turn about in any direction, and then throw on the screen. You see on the screen a photograph of an arrangement of this kind, where the parallel beam of light is reflected upwards by a mirror placed in a box; on the top of this box is placed the outer half of the condenser with the flat side upwards, and above this the objective at the proper distance. If we place on the horizontal surface of the condenser any slide or picture, this is projected on the ceiling, or with another mirror it can be thrown on the screen. If a pointed pencil or needle is used on this the pointer is also shown on the screen, and the lantern manipulator can lecture and use a pointer on the screen as easily as if he were at the screen itself. The same arrangement can be used for showing vibrations of plates of glass covered with sand, chemical experiments with shallow glass tanks, experiments with magnets and iron filings, and endless other demonstrations in physical science. This method of dividing the condenser seems to be almost unknown; the usual way is to place the light dangerously near the lens, and so obtain a parallel beam, using an extra and costly condensing lens to collect the beam. As you will see, this is simply a waste of money.

Another adaptation of existing parts will be found exceedingly useful. When a lantern is used, sometimes close to the screen, and at other times at a long distance, a necessity when the demonstration is given in rooms differing

in size, it is usual to have costly objectives of different focal lengths. This is quite unnecessary. If we have, say, an objective which gives a 15 ft. picture 20 ft. from the lantern, by removing the back lens of the objective and setting the light nearer the condenser we shall get a 15 ft. picture about 40 ft. away; if we remove both, and place the back lens in front, we shall get a 15 ft. picture 80 ft. from the screen. This enables us to work in rooms of any size, and obtain any size pictures we require with the same lenses. There may be a difference in lenses; the distances given are from my own. There is one little objection to this as regards the ordinary lantern in the fact that the objective requires to be brought much more forward, but it is a simple matter to separate this from the lantern body and mount it on a separate stand; in fact, this must be done before other experiments can be performed, all lanterns for physical demonstrations being made in this manner, and mounted on a long board with guides for placing the various appliances correctly in the centre. Replacing the lenses in their ordinary position, we will put in the slide carrier a plate with a narrow slit in it to get a thin line of light, before this we will place a prism which throws the spectrum on the screen, showing the decomposition of light. The demonstrations in spectrum analysis and the decomposition of light are almost endless; these we must leave for your own private experiments. Removing the slit, and replacing it by a plate having a small hole in, we get a small beam of light, with which immense numbers of experiments may be made. We will show you the vibrations of a sheet of paper pasted on the end of a tube, these vibrations being shown by a tiny mirror of thin microscope glass silvered, which reflects the beams. Similar experiments may be made with tuning forks, vibrating rods, etc.

Before leaving the simple adaptations, we will show you the geometric pen on the screen. It is arranged as an ordinary slide, and the patterns which can be obtained are endless. These are not only pretty in themselves, but are useful in the lantern kaleidoscope, which we shall show you, and also for the production of diffraction spectra, a subject hardly suited for demonstrations in a large room. If we remove the objective and put in its place a box which has a hole in it, opposite the condenser, fixing the objective in this box as nearly opposite the opening as possible, we get a picture of any solid object, thrown backwards, and by turning the lantern nearly round we get the picture on the screen. This is known as the aphengoscope, and with it sketches, photographs, pictures in books, watch movements, etc., can be shown. What you have seen is only a small part of what you can yourselves easily do with a little trouble and the expenditure of a few pence on an ordinary lantern.

We will now leave the simple arrangements, and turn to those which require special additions, which cannot be made by an amateur. First, we will take the lantern microscope, which is an arrangement taking the place of the objective. In this the ordinary microscope objectives and slides are used, and in the ordinary form both light and heat are concentrated that the micro slides would be destroyed if the heat were not stopped by a glass tank filled with a concentrated solution of alum. Mr. Furaivel has made for me a lantern microscope, which you see on the screen, and which has the special advantage of focussing the heat rays and the light rays in different places, and the result is that no alum screen is needed, the slides remaining quite cool under the most intense beams of light. We will now show you the kaleidoscope, which also goes in the place of the lantern objective, the best objects for this being bits of lace, asparagus leaves, designs made with the geometric pen, and similar objects, the lace, etc., being cemented on a circular glass plate, which fits into a chromatope frame.

The Mathematical Calculation of Exposures, and a New Exposure Meter.

MR. ALFRED WATKINS read a carefully planned paper on this subject before the members of the Hereford Photographic Society, on April 1st. He referred to the fact that, in spite of the imperfections of exposure tables, and many jokes at their expense, they have proved an aid to many who feel the want of certainty and weakness of the old method. Five axioms were laid down as the "grammar of photographic exposures."

Axiom I.—Five primary factors, each quite independent of the others, govern a photographic exposure. They are: (A) The actinic force of the light falling upon the worst lighted part of the subject. (P) The sensitiveness of the plate used. (S) The capacity of the subject, or its most non-actinic part, for reflecting sufficient actinic light to the lens to form a photographic image of suitable intensity. (D) The size of diaphragm; its relation to the focus of the lens. (F) The distance of the subject from the lens.

Axiom II.—The value of each of the factors (as affecting the exposure) may be expressed in numerical terms.

Axiom III.—The proper exposure for any given conditions being ascertained, the correct exposure for every other possible combination of conditions (or factors) may be calculated by mathematical means.

Axiom IV.—The quantity of actinic light reaching the plate, reflected from all parts of the subject, or even one part of the subject, is no guide to the duration of the exposure.

Axiom V.—Two ultimate factors determine the duration of a photographic exposure on any plate, viz, (a) The quantity of actinic light reaching the plate reflected from that part of the subject which reflects least actinic light, and in which detail is required to be rendered. (s) The duration of this light necessary to impress upon the plate an image approximating as nearly as possible (in inverse intensity) to the visual image of the object in question, is the correct exposure.

The means of ascertaining the values of each of the factors above mentioned were entered into. For factor A it was pointed out that a chemical actinometer was best; a photometer, in which the eye is used for estimating the light being unsatisfactory for this purpose. The bromide of silver actinometer, as advised by Captain Abney, is simple and effective—the number of seconds taken to discolour it to tint giving the A value. It was pointed out that the only proper way to test the light was just *where it falls upon the subject*. An actinometer will soon become as indispensable to a photographer as a thermometer is to a chemist, and the usual advice to test the light in the open, and if you are about to take an interior, to calculate what proportion of the light reaches the subject, is just as absurd as for a chemist wishing to ascertain the temperature of a mixture he is heating, to put the thermometer (or pyrometer) in the heating flame, and then estimate how much of the heat is absorbed, instead of trying the actual heat of the mixture.

The standard for an arbitrary scale of numbers representing the sensitiveness of the plates used was also touched upon.

The factor S was next examined, and the error into which all compilers of exposure tables have fallen pointed out; they have mixed up the quite independent factors of lighting and subject.

In practice it is necessary to give a shorter exposure for white objects (in which detail is required) than for objects

of average colour, and a longer exposure for dark-coloured objects; hence the need for a table of subject-values.

The factor of distance affects the exposure in distant objects, by the atmosphere adding reflected light to the image and shortening the exposure; in the case of very near objects the camera has to be racked out and the exposure is increased. It was found convenient to draw up a scale of subject numbers for all coloured objects and varying distances thus combining the last two factors.

A set of six prints from negatives of widely varying subjects, the exposures calculated by the new exposure meter, and all developed together in one dish, were handed round. They varied in character from a cloud picture to a copy of a dark terra-cotta bust in a room.

Mr. Watkins next exhibited his new exposure meter which he has protected, and which will soon be on the market. It is a small circular brass box, having at one end the actinometer, at the other a chain pendulum for toning both actinometer and camera exposures, while round the circumference are four movable rings each bearing a pointer, for the factors A, P, S, and D; when these are moved opposite their correct values, a fifth pointer, E, gives the correct exposure.

The average time taken to test the light and to find out the correct exposure does not exceed thirty seconds.

The approximate plate numbers for different makes of plates would be given in the instructions, but photographers were advised to make a test to ascertain for themselves what plate number gave a negative of the kind they required with the developer they were in the habit of using.

A rather subtle point touched upon in Axioms IV. and V. was next entered into. More than one photometer is made based upon the idea that the quantity of light reflected from the object and reaching the plate is an exact guide to the exposure. This was pointed out to be quite a mistake, and three different pictures were thrown on the screen, one with a large quantity of white in it, another with a large quantity of black, and a third of average amount; the part of the picture in each case which determined the proper exposure was a patch of dark detail, and the exposure for all three would be the same. Any photometer, however, estimating the light reflected from these subjects would give different and misleading results. Again if three different shades of grey paper were copied on three plates, with three exposures varying in inverse proportion to the quantity of light reflected from the papers, the three resulting negatives would be all of exactly the same intensity, which is not the result desired.

PHOTOGRAPHIC SOCIETY OF IRELAND.—A technical meeting of this Society was held on Thursday evening, 24th ult., at 15, Dawson Street, Dublin, Mr. Greenwood Pim in the chair. A joint paper on "The Utility of Hand-Cameras on Tour," by Mr. M. Hedley and Dr. J. Alfred Scott, was read by the latter gentleman, and a number of slides of pictures taken during a tour in Scotland last year by those two gentlemen were thrown upon the screen, and were much admired by those present. At the conclusion of the paper the Chairman asked Dr. Scott what proportion of exposures, time or instantaneous, were the best. Dr. Scott in reply said that only 18 out of 169 plates exposed were time exposures, and they invariably toned out very good. In reply to Dr. Cosgrave, Dr. Scott said that his lens was a cheap French R.R., with a full aperture of $f/6$, but he found that $f/12$ gave a very general all-round focus, and told better for transparencies. In reply to Mr. Strangways, Mr. Hedley said he used one of Lancaster's Instantograph cameras, placed in a common pine box, with Lancaster's ordinary revolving shutter. The Chairman then exhibited Ferrero's film carrier. Fallowfield's detective camera was shown by the Rev. Canon Bagot, Shew's Eclipse camera by the Hon. Sec., and Dr. J. A. Scott exhibited a hand-camera constructed by himself, and based on Rouch's model.

Our Contemporaries at Home and Abroad.

Anthony's Photographic Bulletin (N.Y.) says: "A novel method of reproducing negatives comes to us through our French exchanges. A dry plate is treated with solution of potassium dichromate of about the same strength as used for carbon tissue. After exposure under a negative, as is well known, those portions that have been protected from light will absorb water, while those that have been exposed to the luminous influence will not absorb this liquid. If the plate is now immersed in an aqueous solution of some colouring matter, those parts that have not been exposed will absorb the coloured solution and the others will remain uncoloured. A dry plate is used according to the report, but a bichromated gelatine film without a silver compound in it should answer the purpose. Paper coated with bichromated gelatine and exposed under positives, such as tracings of engineer's drawings, would give positives in black lines on a white ground, if soluble aniline black is used as a bath. This is only a suggestion; perhaps some of our readers can try it." Articles: "Photographic Exhibitions," "Blisters," "Anthony's Celluloid Films," "A Note upon Eikonogen," "The Chemistry of Copper and its Salts, and their Behaviour in Photography," "Constant Focus and Depth of Focus in Photographic Lenses," "The Action of Light on Silver Chloride," etc.

The *Photographic Times* (New York), in an article on "Rules and Effects of Lighting," says: "A picture is made of light and shade blended with intermediate tints, that is, half lights and half shadows. Nothing in the face is entirely white. All is more or less shaded with touches of shadow in the more receding parts and touches of light on the prominent parts, as it appears in nature on the eyebrows, the arch of the nose, the chin, etc. Neither is anything entirely dark, the shadows being relieved by half shades and half lights, which depict the form of the face and show its anatomy. There must be one light only illuminating the entire picture. In a portrait it is that which falls on the head. That part of the face nearest to the source of light should be lighted the most, with gradation to shadow in the receding parts. Every light should have a focus or centre of illumination brighter than the rest. In a portrait, the focus on the prominent parts of the face, as mentioned above. No light, no shade exists in nature without a focus, without gradation. The shadows should not be vertical nor horizontal, which is unnatural, and inartistic in effect." Articles: "An Interesting Trifle," "Photography in Colours," "The Daguerre Memorial," etc.

Wilson's Photographic Magazine (New York), in an article on "The Arrangement of Dress and Drapery," says: "If the intelligent photographer took pains to examine the pictures made at different studios, he would be surprised to see that in a large majority of them the self-styled artists had made ridiculous attempts to arrange draperies and 'work in' incongruous accessories which are no more in harmony with his subject than the man is with his profession. To improve himself and get the most artistic effect in his work the photographer will do well to study the paintings and statuary of celebrated modern artists. The many beautiful pictures reproduced by the different ink processes, and published at moderate prices, are now within the reach of all. He will also gain incalculable benefits from carefully reading the current photographic literature. Above all, he must be earnest in his desire to accomplish great things, and if he finds that after all his endeavours some one is dissatisfied, he can gather consolation from the poet who said:

'I've allus noticed, great success
Is mixed with troubles more or less,
And it's the man who does the best
That gets more kicks than all the rest,'"

Journal of the Photographic Society of India (Calcutta), speaking on one of the recent Exhibitions, says, "There is a strong feeling amongst those who say they know that, if medals are not freely offered to outsiders of both classes of workers, our exhibition walls will be covered with silver prints of that respectable mediocrity, which they suppose is the supremest effort of the Anglo-Indian amateur photographer. Now this contention is

not unreasonable if the only way of alluring the best pictures to our walls is by a liberal offer of medals. But is this the case? If the best pictures are necessary for educational purposes, and this may be granted, every one of the pictures sent by the home professionals might have been purchased, and sent out to us at probably less cost than we actually paid under the present system. And as regards the local professional photographers, who contributed not a little to the embellishment of our show, I have been told by one of the largest winners amongst them that they are not likely to feel aggrieved, should the Society decide to exclude them from medal-winning so long as they are all placed on the same footing." Articles: "The Indian Amateur Photographer," "The Lens," "Hand Camera," "Eikonogen v. Pyro," etc.

The *Studio* (New York) contains two full-page engravings, "The Ivory Casket presented to Columbus by Ferdinand and Isabella," and "The Descent of the Gypsies," and articles on "The Academy of Design Exhibition," "The Gabalda Collection," "The Terra-cottas of Tanagra and Asia Minor," "The Restoration of the Palazzo Ducale, Florence," "Annual Exhibition of the Royal Society of Painter Etchers of London," "Ancient Employment of Alabaster in Architectural Decoration in England," etc.

The *Art Review* is an exceedingly interesting number, and one of the most interesting points in it is a photo-gravure reproduction of Mr. D. R. Clark's photograph of the "Mosque of Sultan Achmet," recently exhibited at Belfast. The other articles are "The Golden Prime of Good Havonn Alvaschid," "Bourgeois de Calais," "Juliet and her Romeo," "Bores of the Galleries," etc.

The *Art Journal* contains a charming etching of "Winchester College from the Meadows," by Percy Robertson, and there is an article on the same subject by A. G. L'Estrange. The other articles are: "Painters' Studios," illustrated with reproductions of some of Ralph Robinson's charming pictures; "The Royal Palaces, Kensington," "The Summer Examinations," etc.

The *Photographer* (Cincinnati) gives us a supplement, a reproduction of Mr. H. P. Robinson's "He Never Told his Love," under the title of "A Morning Chat." In an article on "Failures," it says: "One cause of failure likely to be general as the spring advances, and the photographer is tempted to go out and meet her, is caused by the apparatus, which, if it can't lie, sometimes gets very thick in its speech, letting in daylight elsewhere than through the lens. We were recently puzzled to know why work done by a certain lens was sometimes wanting in quality—we say sometimes, for it was only now and then that it failed unexpectedly. An inspection of the lens showed it to be perfectly clean, and its tube quite dull. The stops were, however, rather bright here and there. The maker of the lens was asked to say how they could be blacked; a courteous reply was received that it would be glad to restore them. This done, and the bill paid—evidently some very expensive chemicals had been used—a further trial was made, but with the old results, sometimes all right, sometimes all wrong. As the lens was now above suspicion, the camera, which was thought to be all right, turned out to be the source of all the trouble. We found the extra rising front which was used with this lens to have become rather warped, and to let in enough light at the top to slightly veil the picture when the focussing cloth did not happen to cover it up." Articles: "Developing Positives with Hydroquinone," "Novel Application of Photography," "Albumen Paper for Blue Prints," etc.

THE PHOTOGRAPHERS' BENEVOLENT ASSOCIATION.—The adjourned general meeting on May 2nd, 1890, will be held at 181, Aldersgate Street, E.C., at 8 p.m.

PARKER'S MOUNTANT.—Messrs. Parker and Co., of 288, High Holborn, W.C., send us a sample of an effective mountant for photographs, which is entirely free from lumps, and only requires warming before using. In using this preparation the mount does not cockle, nor does it cause photographs to fade. From experiments made, we can recommend this mountant.

THE GUILDFORD AMATEUR ART ASSOCIATION held its first exhibition on the 22nd ult., and attracted a large attendance. The members of this Association, which has been in existence but for a few months, already number 125. Amateur photography was represented at the exhibition by several photographs by Mr. T. M. Brownrigg, Mr. W. Wainwright, and Miss Powell; the platinotypes of the last named being especially admired.

Science Notes.

MR. JOSEPH PENNELL—whose exquisite illustrations in the *Century* are so familiar to us—has written, and Macmillan has published, a sumptuous book on "Pen-Drawing and Pen-Draughtsmen: a Study of the Art of To-day." He deals largely with the photo-mechanical or "process" methods by which the work of the artist is now so frequently placed before the eye of the public.

Mr. Stanley took a set of photographic apparatus with him to the Congo, and, what is somewhat unusual with African explorers, he used it successfully; a fact which will be to the immense benefit of his forthcoming book. He is writing an article for the June number of *Scribner's Magazine*, which will also be illustrated "from his own photographs."

When Dr. Livingstone set out on his second expedition in South Africa he was supplied at a great expense, with a complete set of wet-plate apparatus, which weighed over a ton! Naturally it was left in a swamp soon after he commenced the difficult part of his journey. But some slight changes have taken place in photography since that time (about 1858); and the camera is as indispensable to the modern world-trotter as the revolver, and is usually found much more useful.

At the meeting of the *Linnean Society* on April 17th, Lord A. Russell, on behalf of the subscribers to a portrait of Sir J. D. Hooker, which had been painted by Professor Herkomer, formally presented the portrait to the Society. It was announced that a photogravure of the portrait would be presented, when ready, to every subscriber to the portrait fund. We consider this an excellent idea.

The 130th exhibition of the Royal Society of Painters in Water Colours is now open in Pall Mall. The critics say that there is a continuance of the increase in the size of the pictures, which has been noticed of late years, but which was "never so marked as on this occasion." We can say exactly the same thing about this year's photographic exhibitions. And we doubt whether at the next exhibition of the Photographic Society of Great Britain (held in the same gallery in Pall Mall) anything of less size than whole-plates (8½ ins. by 6½ ins.) will be seen on the walls.

"Make postage-stamp pictures if you like, but don't exhibit them," seems to be the tendency of the present day.

The contractors entrusted with the construction of the New Croton Aqueduct, New York, scamped their work terribly. The *Scientific American* reports that one of the assistant engineers, desirous of fortifying the commissioners with evidence of the bad work, and being an amateur photographer, went into the tunnel to take flash-light pictures. While engaged in the undertaking the man lost his camera, and the supposition is that it was spirited away. The contractors afterwards presented the engineer with a new camera.

The French scientist, M. Marey, has obtained consecutive photographs of moving objects which surpass everything that has hitherto been done in that direction. His results, as reported in *La Nature*, are obtained on a celluloid film of great length which is used in a roll-holder attached to what Marey calls his "photographic gun." Fifty exposures per second can be made.

One great element of success in Marey's work (not stated in *La Nature*, but known to us privately) is that he uses "Chevreul's black" as a background for the moving objects; which are themselves made as white as possible. This "Chevreul's black" is simply a cave of considerable size and depth, the opening of which faces north, and which is covered inside with black velvet. The moving object is photographed as it passes in front of this opening from which absolutely no light is reflected. Thus the horse, bird, or whatever the moving object may be, is photographed without any strong light from behind it; and its body stands out with great distinctness.

Instantaneous photographs which have been taken of a company of infantry just at the moment of their firing a volley (a) with ordinary gunpowder, and (b) with the new smokeless powder demonstrate conclusively the enormous advantage of the latter.

Professor Rood has shown that a flash of light lasting only the forty-billionth part of a second is capable of making an impression upon the retina of the human eye. We shall never get a dry plate as sensitive as that.

The comet discovered by Davidson in Queensland on July 21st, 1889, was photographed on July 30th, at the Lick Observatory

with the new Willard lens, and an exposure of ninety minutes. The comet possessed a round head and a fan-shaped tail, and its light was calculated to be, photographically, only the ten-millionth part of that of the full moon.

A German chemist has succeeded in producing a new red glass of good quality, which it is hoped will be useful in photography. It is made by melting together the following ingredients:—Fine sand, 2,000 parts; red oxide of lead, 400; carbonate of potash, 500; lime, 100; phosphate of lime, 20; cream of tartar, 20; borax, 20; red oxide of copper, 9; and binocide of tin, 13. By a single melting a transparent red glass is obtained, of which various objects can be manufactured directly, without its being necessary to submit the glass to a second heating with the view of intensifying the colour, as is usually the case.

Photographers visiting Stratford-on-Avon are usually rather taken aback when they find a fee of one guinea demanded for permission to take a camera into the birthplace, and a second guinea if they wish to photograph in the church. The rooms in Shakespeare's House or birthplace are so small and empty as to be of little use to the travelling "shadow-faker;" but the church is really fine, and if the fee were half-a-crown we think that many would not grudge it.

Half-a-dozen workers who visited Stratford at Easter managed to get off rather cheaply by working on the co-operative system. As it happened, they were all using cameras of the same size (half-plate) and by the same maker. They gave all their dark-slides to one man, and he paid his guinea, went inside and exposed the entire batch of plates!

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

ON Thursday, April 24th, the subject was "Treatment of Subject by Focus;" which Mr. Dallmeyer re-opened by recapitulating the points made in his paper at the Conference. Captain Abney occupied the chair.

Previous to the reading of the paper the Hon. Secretary handed round a copy of the latest number of *Sun Artists*, just received, which was devoted to presenting examples of the work of Mr. J. B. B. Wellington.

Mr. Dallmeyer, in his lecture, replied to criticisms passed in the discussion at the Conference emphasising his contention that to portray a subject as the eye sees it, the chief plane of interest should be better defined than the others, for the eye has to alter its focus for different planes up to a certain and considerable distance. From the experience of the artist, Mr. Davis Cooper, who for many years has lost the use of one eye, it would seem that there is an alteration of focus for planes within a distance of about sixty yards. Uniformity of definition robbed the lens (which was single-eyed) of conveying solidity, an effect only to be fully gained on a plane surface by contrast in definition.

Mr. Clark opened the discussion with a short paper, and an animated controversy was kept up for some time by Messrs. Davison, Elder, Balfour, Tomlinson, Captain Abney, Rev. F. C. Lambert, and Dr. Patterson, to whose remarks Mr. Dallmeyer replied.

On Thursday, May 1st, Captain Abney read a paper on "Pin-holes," and on Thursday, May 8th, there will be an exhibition of lantern-slides from negatives recently taken by Mr. D. R. Rodgers and Major Nott in Egypt, and by Mr. H. M. Elder in Madeira.

HOME PORTRAITURE PICTURES.—We have returned all photographs sent in to our recent "Home Portraiture Competition," for which stamps were sent, and the remaining prints will be returned upon receipt of stamped addressed label before May 10th, otherwise they will be devoted to our "Collection for Hospitals."

NORTH KENT AM: PHOT: SOC:—A meeting of this society was held on Thursday, April 24th, Mr. T. C. Johnson, J.P., President, in the chair. Mr. F. Boorman was elected a member of the society. There was no set paper for the evening, but a pleasant and instructive discussion took place among the members present. The President showed some views.

Exhibitions.

GLASGOW AND WEST OF SCOTLAND AMATEUR PHOTOGRAPHIC ASSOCIATION.

THE annual Exhibition of this Society was opened on Saturday last, at the rooms of the Society, which are not well suited for such an Exhibition, as the light is got from windows at the side of the rooms, instead of coming from above, so that the pictures are more or less irregularly and imperfectly lighted. It would be a great advantage to the Exhibition and to the Society itself to have the annual display in premises better adapted to the purpose. There are in all 108 exhibits, mostly in sets of three each; these are divided into ten classes in the competitive section, composed of landscapes, figure studies, instantaneous, portraits, groups, animals, still-life and interiors, enlargements, transparencies, and developed prints.

In the Landscape Class the first prize has been awarded to Mr. D. R. Clark's exhibits, one of which is a delicately toned print by Blanchard's process, and which is titled "The Trysting Tree." This picture has been successful in gaining the AMATEUR PHOTOGRAPHER Silver Medal for the most artistic picture in the Exhibition. The second prize has been gained by a very nice frame of three pictures by Mr. C. J. Shaw, and the third prize is awarded to Mr. George Sherriff for three prints done by Blanchard's process, but rather dark in tone. The principal feature in the small-size landscapes are some studies in Brittany by Mr. R. H. Elder, who gains the first and third place; his pictures are sharp and nicely chosen but rather under-exposed. The second prize falls to Mr. John Morrison, jun., who well deserves the position, for three nice little hand-camera pictures full of detail and nicely lighted.

In the Figure Studies the only prize awarded falls to Mr. D. R. Clark for three pictures, one of which "Two a Penny," is rather clever in arrangement. His other pictures are "The Army of the Future," representing a number of tiny little boys playing at soldiers, and "A Funny Story," a shoeblack laughing at a story he has been reading. Miss Lang shows three nice pictures in this class, but they are small and too high placed on the wall to do them justice. It is a pity to see so few exhibits in the Figure Study Class, which should bring out the originality and artistic quality of the members of the Society.

In the Portrait Class, Mr. Taylor is awarded the prize with three nice heads, but the other exhibits in this class are so poor that the judges have not considered it necessary to give a second prize. The same applies to the groups where only the first prize is awarded to Mr. Alexander.

Mr. James Fleming is first in the Animal Class, with three nice exhibits.

In the Instantaneous Class Mr. G. Sherriff is first with three pictures, one of which, entitled "Before the Wind," is remarkably good, although the tone of Mr. Sherriff's prints does not do justice to the pictures. The second prize falls to Mr. T. Steven, jun., for three yacht studies, the centre one being particularly good, having been taken against the sun, with a bank of white clouds behind the yacht, which balances the picture nicely.

In the Interiors and Still-Life Class, Mr. D. R. Clark is again first with three large pictures of the Municipal Buildings, Glasgow. They are printed on Obernetter paper, and although the glazed surface represents, no doubt, well enough the marble of the walls, yet they might have looked as well and more artistic if printed in platinotype. The second prize is awarded to Mr. T. Steven, jun., but his exhibits are rather under-exposed, although interesting in subject. In this class Mr. Geo. Sherriff's interiors are worthy of notice, but slightly foggy in one case. Mr. James Fleming has also three very nice flower studies, which are put in the same class.

Mr. Watson is awarded the prize for three very good lantern slides in the Transparency Class.

There is a class for Developed Prints, and Mr. J. Ure Primrose carries off the first and second prizes in this class. We think the order might have been reversed, and the three pictures placed second should have been first, as they show more artistic feeling than those placed first, the picture of a steamer with the smoke in wreaths behind being the best of the lot, and nicely printed. In this class Mr. Dove's studies are good, his "Glen Rosa" being a prettily toned picture; but we hardly think it can be a de-

veloped print, it looks more like one done with Blanchard's process. We are at a loss to know why there should be so many classes in a comparatively small exhibition like this, and it is surely unnecessary nowadays to make a separate class for developed prints.

In the adjoining room are exhibited the non-competitive pictures, among which we notice five of Mr. Clark's, which we have previously seen in the Prize Tour Competition. Mr. Fleming has also some in this class which are good.

The Enlargements have brought forward five competitors, and they are all very indifferent in quality. Mr. Watson obtains first prize, but only one of his pictures, "Faleide, Norway," is good. Mr. Morrison's enlargements from hand-camera negatives are too big; if they had been a third of the size they would have been more effective. The other enlargements are of the usual soot and snow type, and the judges have not considered any of these exhibits worthy of a second prize.

We trust that the Glasgow and West of Scotland Association next year will open their exhibition to exhibitors from other parts of the kingdom, so that the members may have an opportunity of testing their work in open competition with other amateurs.

* * * *

ULSTER AMATEUR PHOTOGRAPHIC SOCIETY EXHIBITION.

THE fourth annual Exhibition of the Ulster Amateur Photographic Society, opened in the Art Gallery of the Free Library, Belfast, on Monday, is a decided advance on the three former Exhibitions. It is the second at which competition has been invited from "across the water," and it is curious to note that, while England, Scotland, and Wales are all represented, there is not a single picture by a "native" who is not a member of the Society! The room in which the Exhibition is held is admirably suited to the purpose, being built as an art gallery, and lighted entirely from the top. A rail runs round the room at a short distance from the wall, protecting the pictures from injury by those enthusiastic persons who desire to point out their favourite "bits" with more vigour than discretion. There are 126 frames for competition; 74 in the section devoted to members, and 52 in the open section. These are distributed over 15 classes—for of the 21 classes, two are for "best prints" and included in others, two are for lantern slides, and in two there is no competition. Besides these, there is a large number of frames not for competition, and a special feature of the "show" is a splendid collection of pictures by Mr. Harry Tolley, of Nottingham. These have recently been on view in Liverpool, and Mr. Tolley most kindly lent the complete set of fifty 15 by 12 photographs. The inhabitants of the Emerald Isle will now have a good chance of seeing "how it's done."

Class 1 is divided into two sections, in each of which there is a good competition—eleven entries in Section A, for four pictures any size, and six in Section B, for six pictures not larger than half-plate. In the first section Dr. Coates, who has no less than four sets, takes both first and second places. The silver medal is awarded to four silver whole-plate prints, Nos. 8, 9, 10, and 11. No. 8, "A Tree Study," is a very fine piece of work, the detail (forgive him, Dr. Emerson!) being wonderful, but the two cottages, real Irish ones, 10 and 11, are not so artistic, though perhaps equal from a technical point of view. The second prize set is in Aristotype (and here we may remark that the judges have all through shown a decided liking for glazed surfaces). In two of these, No. 2, we have two views of a waterfall at Glenariffe, in which Dr. Coates has been singularly happy in giving the proper effect of a thin sheet of water. Dr. Cecil Shaw, the Hon. Sec. of the Society, shows four good cold-bath platino prints, the best being 19, "An Old Church, Hertfordshire," but the most artistic is 14, "On the Strand," a study of horses and carts on the sea shore, in which the lights and shades are well balanced. Mr. Alex. Tate, C.E., Vice-President, shows four 12 by 10 silver pictures, one of which, 32, a view of a country house through trees, has been selected by the judges as the best print by a member, so obtains the medal in Class 10.

We now arrive at Section B, in which the silver medal goes to Mr. J. J. Andrew, for a set of 5 by 4 silver prints, No. 43. The bronze medal is gained by Mr. T. L. Buck, with a capital set of half-plates in platinotype, "As Shadows Fall" (39) and "The First of the Season" (40), being charming. The latter is a little village lad seated on the bank of a brook, gazing in admiration

on a small trout which he has just landed. Mr. William Swanston, Vice-President, has three sets, 46, 47, and 48. The first and third are charming bits of Norwegian scenery, from film negatives, and the second set, in gelatine or chloride, also from films, are "Quay-Side Scenes in Belfast." The last set has been awarded an honourable mention, of which it is well deserving. Another honourable mention is given to Mr. T. B. Scott, who has a set of half-plate views in aristotype.

In Class 2 there is one frame, but no award is made. The scarcity of instantaneous work can only be attributed to the very small quantity of sunshine vouchsafed to the North of Ireland last summer.

In Class 3 (Portraits) Mr. W. J. D. Walker takes the medal with a set of six groups and single pictures of children. We commend them—the children—to any ladies visiting the Exhibition, as most healthy-looking specimens. "The Cruise of the Clothes Basket" (No. 59) is perhaps the best; two youngsters in a big basket, setting out on a voyage of discovery over the nursery floor. The small boy being in sailor dress adds to the effect.

In Class 4, as in Class 17, we can offer no criticism, not having seen the Lantern Slides, which are shown on the screen each evening.

In Class 5 only two members sent Enlargements, and no award is made.

The next class represented on the wall is Class 8, where, though no more than two "Juniors" appear, the judges have awarded a bronze medal to each, their work being so exceedingly creditable. Mr. T. L. Buck sends six rustic studies in different printing processes. No. 71, "Happy," on Ilford bromide paper, is a well-chosen group of small boys playing marbles. Mr. T. F. Bell has six landscapes of the foliage and water class, on Obernetter paper, showing a microscopic fineness of detail. In Class 9 the same gentleman gains the medal with six excellent studies in the Dublin Zoo.

At Class 11 we come to the second section of the exhibition—open to all amateurs. This class is for landscape. The silver medal for the best picture falls to Mr. J. E. Austin, of Maidstone, for his beautiful picture, "A Glimpse of the Old Home" (No. 76). The bronze medal in this class goes to Mr. D. R. Clarke, M.A., of Glasgow, for a large print in Blanchard platinum, "The Trysting Tree." This recently took the highest honours in Glasgow, and runs Mr. Austin's picture very close.

Class 12, for "Six Animal Studies," draws only two competitors, and the medal goes to Mr. F. Wingrave Hardy, of Coventry, who sends a good series of studies of sheep and cattle in pasture. Most of these might be entered as landscape, and all are really picturesque. The other frame is by Mr. W. H. Kitchin, of Cardiff, who sends six pictures, "At the Zoo."

Class 13, for "Six Architectural Pictures," is one of the largest and best in the Exhibition. The silver medal is awarded to Mr. D. R. Clark, of Glasgow, for three large interiors "In the Municipal Buildings, Glasgow," "Clairmont Drawing-room," "Sultan Achmet's Mosque," and "Glasgow Cathedral Interior"—a large and varied selection, certainly! The first of these, a marble stairway, printed in Blanchard platinum, receives the silver medal in Class 21, as the "Best Print in the Exhibition," and well deserves it, we think. A third award falls to Mr. Clark for the fifth of his series—the Ilford bronze medal, of Class 19, for the second-best picture from a negative on an Ilford plate. The "Mosque of Sultan Achmet," which obtains this distinction, is a marvel of detail, showing the magnificent inlaid marble of the interior, with its hundreds of hanging lamps. Mr. Alex. Tate, C.E., a Vice-President of the Society, takes the bronze medal with a series of six silver whole-plate prints—five of which are ecclesiastical architecture. "Becket's Crown, Canterbury Cathedral," is capital, as is also "Christ Church Cathedral, Dublin." The sixth of the series, "Galilee Chapel, Durham Cathedral," suffers slightly from non-perpendicular lines.

In Class 14 (Genre Picture, illustrating "The Village Blacksmith") the silver medal presented by the editor of *Photography*, goes to Mr. Benj. Karleese, of Birmingham.

The prize of three guineas for Figure Study on Fry's plate, in Class 15, is taken by Mr. S. F. Clarke, of Louth, Lincolnshire, for a rather theatrical group of three girls in fancy dress, "Fortune Telling."

Class 16 is for Landscape or Interior on a Fry's plate, and here the prize of two guineas goes to Mr. J. E. Austin for "Ebb Tide and Day" (No. 107), a vigorous platinotype print, with remarkable, but by no means impossible, clouds.

Class 17 is for Lantern Slides on Fry's plates, the prize of a guinea and a half being taken by Mr. S. F. Clarke. The same gentleman—evidently an ardent admirer of Messrs. Fry—takes the guinea prize in Class 18, for the best print on Fry's paper. This is "What Love Hangs By" (No. 119), a clever and amusing picture of a young woman sewing a button on her young man's waistcoat. She is just biting off the thread, and he is looking into her face, apparently contemplating osculatory payment!

Class 19, for pictures taken on Ilford plates, produces a large number of competitors, testifying abundantly to the extreme popularity of this make. The silver medal is awarded to Mr. J. E. Austin's "Cooling Waters," a study of cattle in a stream. No doubt it may be the best picture, but if the award were made with reference to the quality of plate showed by the picture, we think it would be better given to "Watching the Trout," by the same gentleman. This shows splendid "pluck" and vigour, with very fine detail. As already noticed, the bronze medal goes to a picture also entered in Class 13. "The Haunted House" (No. 115), by Mr. John W. Beaufort, Malvern, is an extraordinary "Ghost" picture.

In Class 20, for the best Enlargement on Ilford paper, there are eleven entries. The silver medal goes to a small and wonderfully sharp picture by Mr. Kitchin, "The Village Smithy;" while the bronze is taken by Mr. J. W. Beaufort, with a "Gleam of Sunshine," a really splendid enlargement from a quarter-plate.

Among the pictures not for competition is some excellent work, and a whole wall is devoted to the magnificent collection of Mr. Tolley's pictures mentioned above. Altogether the exhibition is a decided success for the Ulster Society, which is still young, but shows every sign of healthy growth.

AWARDS.

Open to Members of the Society.

Class 1 (Section A, Landscape, any size, four pictures).—1st, silver medal, S. B. Coates, M.D.; 2nd, bronze medal, S. B. Coates, M.D. Section B. (Landscape, half-plate or under, six pictures).—1st, silver medal, J. J. Andrew; 2nd, bronze medal, T. L. Buck; Honourable Mention, Wm. Swanston, F.G.S., T. B. Scott.

Class 2 (Instantaneous).—One competitor, no award.

Class 3 (Portraits, six pictures).—1st, bronze medal, W. J. D. Walker.

Class 4 (Lantern Slides, six).—1st, silver medal, J. J. Andrew; 2nd, bronze medal, D. Brown.

Class 5 (Enlargements, two).—Two competitors, no award.

Class 6 (Micro-photographs).—No competition.

Class 7 (Pictures done on Society's Excursions in 1889).—No competitors. (Excursions a failure, on account of the wet season.)

Class 8 (Juniors, any subject, six pictures, by a member who has begun work since January 1889).—Equal 1st, bronze medals, T. L. Buck, T. F. Bell.

Class 9 (Natural History Subjects, six).—1st, bronze medal, T. F. Bell.

Class 10 (The best print in the Exhibition, by a member).—AMATEUR PHOTOGRAPHER Silver Medal, Alex. Tate, C.E.

Open to all Amateurs.

Class 11 (Landscape, best picture).—1st, silver medal, J. E. Austin, Maidstone—"A Glimpse of the Old Home"; 2nd, bronze medal, D. R. Clark, M.A., Glasgow—"The Trysting Tree."

Class 12 (Animal Studies, six).—1st, silver medal, F. W. Hardy, Coventry—Cattle and sheep in pasture.

Class 13 (Architecture, six pictures).—1st, silver medal, D. R. Clark, Glasgow; 2nd, bronze medal, Alex. Tate, C.E., Belfast.

Class 14 (Genre Picture).—"The Village Blacksmith."—1st, silver medal, presented by Editor of *Photography*, Benj. Karleese, Birmingham.

Class 15 (Figure Study, from negative on Fry's plate).—1st, three guineas, S. F. Clarke, Louth, Lincolnshire, "Fortune Telling."

Class 16 (Landscape or Interior, from negative on Fry's plate).—1st, two guineas, J. E. Austin, Maidstone, "Ebb Tide and Day."

Class 17 (Lantern Slides, six, on Fry's plate).—1st, one and a half guineas, S. F. Clarke, Louth.

Class 18 (Print on Fry's Argentotype paper).—1st, one guinea, S. F. Clarke, Louth, "What Love Hangs by."

Class 19 (Best picture from a negative on an Ilford plate).—1st, silver medal, J. E. Austin, "Cooling Waters"; 2nd, bronze medal, D. R. Clark, "Mosque of Sultan Achmet."

Class 20 (Best Enlargement on Ilford paper).—1st, silver medal, W. H. Kitchen, Cardiff, "The Village Smithy;" 2nd, bronze medal, J. W. Beaufort, Malvern, "A Gleam of Sunshine."

Class 21 (Best Print in the Exhibition).—1st, silver medal, D. R. Clark, Glasgow, "Interior Municipal Buildings, Glasgow."

Judges.—Mr. Hugh Reid, ex-President Glasgow Amateur Photographic Association; Mr. Wm. Tomkinson, Vice-President Liverpool Amateur Photographic Association; Mr. George Trowbridge, Head Master, Belfast Government School of Art.

Notes from the Liverpool Centre.

(From our District Editor.)

I HAVE been shown several studies taken last week, which speak eloquently of the present favourable conditions of weather and atmosphere for outside work. Should the same conditions rule to-morrow (Saturday), the excursion of the Liverpool Association to Ledsham and Burton will be very largely attended.

Several local gentlemen have crossed the Irish Channel to Belfast purposely to see the Belfast show, opened last Monday. Mr. T. S. Mayne and Mr. W. Tomkinson, the latter a judge in the function, journeyed together. The adjudicating, I hear, was satisfactorily disposed of on Saturday. The exhibits embrace excellent work. Messrs. Mayne and Tomkinson are making one or two visits to Dublin and other towns during their short stay in Ireland.

The Birkenhead Photographic Association, in a few months, is likely to have an excellently appointed building at its command. The "city of the future," as it has long been styled by Cestrians, is lamentably behind-hand in the way of public institutions, and at present may be said to be almost entirely without a building suitable to a scientific or art society. But this is to be remedied. A speculator, or a company, is about to build a large hall in the town suited to educational and scientific bodies, and the building is to be fitted up with dark-rooms and all accessories for photographic purposes. The Birkenhead Photographic Association will, I understand, have the first refusal of the new hall. The carrying out of the scheme cannot fail to benefit the Birkenhead Society in a large degree.

The ordinary meeting of the Liverpool Association held on the 24th ult. was numerously attended and exceptionally instructive. Mr. J. A. Forrest, who read a paper on "The most effective means of Preventing Light getting to the Sensitive Plate while in the course of Development in the Dark-Room," and who undertook to explain "the cause of fog on lantern-slide covering glasses," is a large glass manufacturer and merchant in Liverpool, a past member of the Liverpool City Council, and an old worker in photography and art. His contributions to the night's procedure were highly interesting, as were those of Mr. F. Vaughan, who demonstrated on "Photography as applied to Letterpress Printing." Mr. Vaughan is a young man lately settled in Liverpool with a partner, as photo-engravers, zincographers, etc.

Apropos of the fortnightly demonstration on Wednesday night, at the Liverpool rooms, I had a long controversy with a young member of the Society. He assures me that the younger members of the Society, with the inexperienced of older growth, set much value on the practical demonstrations. They are not only entertaining and instructive, but they save novices endless trouble and anxiety. Mr. J. L. Mackrell, late Secretary to the Birkenhead Association, was one of the first to suggest practical demonstration evenings, as he was one of the first to offer his services as a demonstrator. My personal knowledge of Mr. Mackrell is that he is very popular with his colleagues, and much sought after by young members. At outdoor meetings he usually has a batch of novices under his charge, taking a special interest in their advancement. He is young himself, has been in photography between four and five years, and holds a number of medals, including one from the AMATEUR PHOTOGRAPHER. Finally, he is self-taught. Mr. J. MacDonald Bell and Mr. H. Wilkinson were the demonstrators; subject, "Printing and Toning of Silver Paper"—including Obernetter and Aristotype papers.

The Lantern Society.

THE inaugural meeting of the new society bearing this title, and having for its chief objects the development and the popularisation of the optical lantern, took place in the theatre of the Society of Arts, on Friday last, when some 200 ladies and gentlemen attended.

The Chairman of the Council, the Hon. Slingsby Bethell, prefaced the demonstration by an apology for the impromptu nature of the programme, which he said was due less to a lack of resources than to an earnest desire to make an early beginning, with the view to placing the claims of the new body well in the foreground. Having explained that the session proper would commence on the 1st of October next, and that all applications for membership received in the interval would be treated as belonging to the year then to be entered upon, he appealed to all present who were interested in the optical lantern to bring the claims of the society before their friends at the first fitting opportunity, and, continuing, said it had been agreed that the programme of the society might be best carried out—

(1) By the engaging of premises in some central position in London, at which the meetings of the Council and of the society might be held.

(2) By acquiring suitable apparatus for the purpose of giving exhibitions of general and scientific interest to both members and their friends.

(3) By obtaining the services of specialists in every branch of art or science suited to optical demonstration.

(4) By offering—as far as the funds of the society will permit—remuneration or rewards for the development of the optical lantern, and of all apparatus pertaining thereto.

(5) By imparting instruction to those who are desirous of learning how to effectively manipulate the optical lantern, to produce slides and apparatus, and to efficiently employ the same both in private and in public.

(6) By securing for the members of the society special and advantageous terms from manufacturers and others for the purchase or loan of apparatus and slides.

(7) By forming a large and comprehensive loan collection of lantern transparencies pertaining to art, science, and kindred subjects; such loan collection to be placed at the disposal of every member, upon conditions to be laid down by the Council.

(8) By providing a means of inter-communication between the members of the society, whereby each member may be made acquainted with the private collections of his fellow-members, and may be able to negotiate a mutual loan if so desired.

(9) By arranging an interchange of demonstration between photographic, microscopical, and other societies interested in optical lantern work.

The Chairman further remarked: "The marvellous powers of photography to illustrate and bring home to the mind in the most striking and faithful manner (especially by means of the optical lantern) the glories and beauties of Nature, the treasures of art, and the wonders of science, induce us to hope that, by drawing together persons thus interested, a powerful Society might be formed on an intellectual, educational, and scientific basis, with a recreative and social side, and of which our present meeting is but a crude and incomplete example."

"Although not a 'club' in the usual sense of the word, still we hope soon to have a suitable habitation, where meetings of members will be held, papers read, discussions encouraged, and some photographic work carried on."

"Composed, as I believe we shall be of scientific and practical men, of professional as well as of amateur photographers, of those learned in chemical, microscopical, and optical science generally, constructors and designers of every description of apparatus, we shall endeavour, at least, to benefit and instruct each other (if not those unconnected with us) and bring to greater perfection in all its phases and aspects (technical as well as artistic) this particular branch of the art and science which we have adopted for study."

"Another aim that the Society has in view is the formation of a large loan collection of lantern slides, complete in its classification, arrangement, and method of illustration."

"As we advance, scientific and photographic societies, educational bodies, schools, institutes, etc., will have facilities of affiliating themselves to us, and thus obtaining much assistance from our extensive photographic library, so to speak. Members will, of course, receive this privilege to a larger extent, and many more,

for eventually we hope to offer them additional advantages, viz., the use of dark-rooms and laboratories for all photographic operations, the production of lantern slides in particular.

"America has already made great strides with the optical lantern, so we shall endeavour to put ourselves *en rapport* with our cousins across the Atlantic, and to interchange with them for photographic illustrations of their grandest wonders of nature, representations of some of our homely, but lovely scenery.

"Welcoming, as members of the Lantern Society, all thus interested, we shall develop I trust into a large and influential body, competent and willing to place any fresh knowledge and experience that we may acquire within the reach of others of like tastes.

"Finally, growing in strength, we may number amongst our body members, practically and scientifically more learned in particular branches of science, who will come forward and initiate us into the meaning, mysteries and beauties of many of our unappreciated photographic illustrations."

Following the address of the Chairman—which was cordially received—there were projected upon the screen about 130 very fine slides, divided into three different lots.

The proceedings were much enjoyed, and more than one application for membership was made in the room.

In the interval that elapses before the programme of the Society is entered upon in earnest, the Council will be busily engaged in drafting bye-laws, selecting suitable accommodation for the future home of the Society, and the Honorary Secretary, Lieutenant C. E. Gladstone, R.N., will be pleased to forward full particulars and applications for membership upon receipt of a postcard at 6, Bolton Street, Piccadilly, W.

Apparatus.

MR. ROBERT ABRAHAM has shown us several novelties—first his "Victor" hand-camera, which has a most ingenious attachment for lifting the plates into the changing bag, by raising the lid only. This action or motion also sets the shutter. The camera is fitted with Abraham's Challenge R.R. lens, of $5\frac{1}{2}$ inch focus, two finders, carries 14 plates, and when loaded weighs only 5½ lbs. For a cheap (£5 3s. 6d.) hand-camera it is a serviceable article. We offered a suggestion as to the method of lifting the

Fig. 1.—THE CAMERA, SHOWING CHANGING BAG.

Fig. 2.—THE "IDEAL."

plate, which will, we believe, be adapted to this camera for the future. The "Victor" has an adjustable focusing arrangement by which objects can be photographed at distances ranging from five to twenty feet, beyond which all things are in focus.

We also have had an opportunity of examining the "Ideal," and are much pleased with it. The plates are stored in an upper chamber, and drawn down into position for exposure by means of a bolt, which, returning, brings down the next plate, each draw of the bolt registering the number of the plate; the movements are carefully thought out. This camera has an excellent shutter, which can be timed to give an exposure of any duration, and for speeds varying from half a second to the 100th of a second. The shutter works in the diaphragm slot, and is well-made, and certainly one of the best we have seen. The "Ideal" is fitted with a Laverne lens, working at $f/11$. Intending purchasers will do well to see both these cameras.

Another novelty of Mr. Abraham's is a walking-stick tripod, which we illustrate. It is most ingenious, quite rigid enough for

Fig. 3.—WALKING-STICK TRIPOD.

Fig. 4.—TRIPOD CLOSED.

hand-camera work, and a useful companion on a lonely road. It weighs $1\frac{1}{4}$ lbs., is made of metal and bamboo, and is constructed upon the same principle as an umbrella.

* * * *

MESSRS. W. W. ROUGH AND Co., of 180, Strand, have kindly given us an opportunity of examining their "Eureka" detective camera, which has been improved, and can now be used for plates or films. It is fitted with an R.R. lens of 5 in. back focus. The chamber holding plates is detachable, and any number can be supplied, each made to hold twelve plates, so that the work to be done without loading or changing has no limit. The plates are all in sheaths, which

Fig. 1.—CAMERA COMPLETE.

can also be supplied to carry films if desired. They are changed by means of a lever lifting them into a changing-bag, which permits of easy manipulation. A blind shutter is fitted, which can be arranged for time or instantaneous exposures if required.

Fig. 2.—CHANGING CHAMBER.

Fig. 3.—CAMERA ON TRIPOD.

When the plate chamber is taken over, the camera is fitted with focussing screen, and can be used as an ordinary camera on tripod. For detective work, a finder, which is in correct register with the lenses, is provided. The "Eureka" detective camera is the handiest and most unobtrusive apparatus in the market.

"AMATEUR PHOTOGRAPHER" CERTIFICATES.—We should be pleased to know the address of the following gentlemen: Messrs. J. A. Randell, W. P. H. Foster, L. A. Burrows, and V. W. Delves Broughton, for whom we hold "certificates," also of Col. C. O. Ellison, Liverpool.

COLCHESTER CAMERA CLUB.—On April 14th the members of the above club to the number of forty met to witness a demonstration by the Britannia Co., Ilford, in their "Alpha" paper and lantern slides. Both paper and slides were shown to give excellent warm tones, besides being easy to work. The demonstrator was severely questioned, but was always ready with an answer. Mr. Winch, a member, kindly lent about 700 photographs for the use of the members.

Register of Dark-Rooms, 1890.

WE have pleasure in publishing preliminary list of towns in which "Dark-Rooms" have been placed at our disposal.

We class them in four divisions, *i.e.*, *a* amateur, *d* dealer or professional, *h* hotels, and *s* photographic societies.

In our letter of introduction full particulars are given as to owner, address, charges (if any); plates, chemicals, etc., kept by dealers; terms for temporary membership of societies; hotels; distance from station, etc., etc.

Every application for letter of introduction must be accompanied by SIX PENNY STAMPS. The owner of "Dark-Room" will be advised by same post as the applicant.

Societies' Meetings.

NOTE.—In this column the Editor can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editor will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BLACKBURN AND DISTRICT PHOT: SOC:—The general meeting was held on the 24th ult., the President, Mr. Gregson, in the chair. The Chairman, who, in prefacing, said that the society would benefit by the election of Mr. Burrows as a co-Secretary, read a paper on the manufacture of chloride plates for lantern slides, all of which were practically demonstrated. Several questions were afterwards asked and satisfactorily answered by the Chairman. The new dark-room, which has just been completed, was then inspected by the members, and general approval of it was expressed. An excursion to Whalley was fixed for May Day.

BRIGHTON PHOT: SOC:—An ordinary meeting was held at the New Road Lecture Hall on Tuesday, April 22nd, when there was a fair attendance of members and friends. Mr. W. Jago gave an instructive and highly interesting address on the chemical changes caused by the exposure of dry plates to light in the camera, and the subsequent development by various agents. A discussion ensued, and interest was excited by a show of apparatus contributed by Mr. S. B. Hardcastle and other members. The Secretary announced that the first excursion of the season would take place to Shoreham on April 29th.

BRIXTON AND CLAPHAM CAMERA CLUB.—On April 25th the fortnightly meeting was held at 35, Bedford Road, S.W. After usual business a communication was read by Mr. W. H. Powell on the subject of "Developers and Development," in which he treated of pyro, ferrous oxalate, and hydroquinone, and the purpose each was specially adapted for. Speaking of negative work, he touched on the various preservatives used for pyro, and the modifications required in the developer and its manipulation for various kinds of work, such as instantaneous, clouds, portraiture, landscapes with weak or strong contrasts, etc., etc., and also in cases where the correct exposure had not evidently been given. An interesting discussion followed. A trip to Greenwich was arranged for on May 10th.

CHESTER SOCIETY OF NATURAL SCIENCE AND LITERATURE—PHOTOGRAPHIC SECTION.—At a meeting of the above section, held on April 21st, a paper was read by Mr. E. G. Ballard, Associate Royal School of Mines, on "A New Actinometer." The need of a ready and quick method of measuring the actinic rays of light proceeding from any object, or reflected therefrom, has for a long time been felt by photographers, and they may welcome the instrument introduced by Mr. Ballard (which is patented) as one of the best attempts in this direction yet before the public. It is very simple, and so constructed that the actinic rays proceeding from the object about to be photographed can be viewed and compared for the purpose of deciding the exposure. The range of the instrument exhibited was from '01 sec. to 100 secs. exposure with *f*/16 stop, using an Ilford ordinary plate. Tables for any make of plate can be furnished, or the instrument itself can be adjusted to the plate in use. There is nothing fragile about it, it occupies a small compass, is light, and always ready at a moment's notice. As soon as the inventor can arrange for its manufacture the instrument will be in the market, and its price will be moderate. At the meeting some negatives were exhibited, the exposures of which varied from 1 sec. to 600 secs., and as they were of the same subject it was difficult to distinguish between them, so uniform were they in quality. The latter negative was taken at 7 p.m., when it was getting dusk, and as far as detail was concerned was equal to that taken at midday.

HACKNEY PHOT: SOC:—The annual soirée was held on Thursday, the 24th ult., about 400 being present. A most enjoyable evening was spent, due appreciation being given to the vocal efforts of the President, Misses Hensler, Attrill, F. Jolly, W. A. Hensler, Harding, etc., and to Messrs. Jelley and Scott, and Miss Rose Hensler, with solos respectively on oboe, bassoon, and violin. The society boasts of an orchestra which played "L'Italiana" and "Dream on the Ocean" very creditably. Mr. Beasley gave an amusing conjuring entertainment, and Messrs

Sewell, Singer, and Augustus Wilson recited. The evening was brought to a close by exhibiting members' lantern-slides on the screen. The room was prettily decorated with flags and plants, the lady members being busy all day in making preparations.

HASTINGS PHOT. SOC.:—At a meeting of the Hastings Photographic Society on the 21st April, at the Brassey Institute, the Rev. W. H. Green presided over a fair attendance. A communication was read from the Secretary of the Lewes Photographic Society, inviting members to the Lewes excursions during June and July. It was decided to accept the invitation with thanks, and to leave the choice of dates in the hands of the Secretary. The names of Dr. Humphreys and Mr. Gibson were added to the Committee. The remainder of the evening was very profitably spent in listening to a lecture given by Mr. Godbold upon the "Platinotype Process of Photography." A number of experiments rendered the discourse additionally interesting.

HOLBORN CAMERA CLUB.—The usual monthly lantern night was held on Friday, April 25th, when about 250 lantern slides, made by members of the club, were shown to an appreciative audience, Messrs. Benest and Cobb manipulating the lantern, which was kindly lent by Mr. Gay. One new member was elected, and Miss Hare was proposed as a member of the club. On Friday a paper from one of the photographic journals, and a discussion on the same.

MAIDSTONE AM. PHOT. CLUB.—At a lantern-slide exhibition held in connection with this club at the Old Palace, Maidstone, on Friday, the 25th ult., the hall was crowded with ladies and gentlemen of the neighbourhood interested in amateur photography. The slides exhibited were the work of Messrs. Morphet, Lowry, Clout, Adams, Sunderland, Bear, Bath, Laurence, Dresser, and the President, Mr. J. E. Austin, and their clearness when thrown on the screen showed the possession of no small amount of skill in the photographic art on the part of the contributors. The subjects also were well chosen. The best of the slides were those prepared by Mr. Austin (who it may be mentioned was the winner of three prizes at the recent exhibition held at Newcastle) and Mr. Dresser.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to **The Editor, "Amateur Photographer,"** 1, Creed Lane, Ludgate Hill, London, E.C.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

QUERIES.

3750. Stand for Hand-Camera.—What is the best kind of walking-stick or alpenstock stand? I should like something which really looks like a walking-stick if possible.—W. S. P.

3751. Stand for Hand-Camera.—What is the best stand to use with a hand-camera, for long exposures? Please give price and name of maker.—PILULA.

3752. Exposure.—With a half-plate rapid view lens, and Ilford ordinary plates, what exposure would be needed to take a group, under an awning on board ship, using stop $f/16$ or $f/22$, at, say, 3 p.m., in either the Mediterranean, Red Sea, or Indian Ocean, during the months of August or September?—CALCUTTA.

3753. Saloon of Ship.—Can a picture be taken of the saloon of a ship, with passengers at the tables? If so, what exposure would be required, using a half-plate rapid view lens, Ilford ordinary plates, the electric light, and stops $f/8$, $f/11$, or $f/16$? Perhaps Major E. F. Becher, R.A., will reply.—CALCUTTA.

3754. Hand-Camera in an Exhibition.—Will any amateur kindly tell me if I can take with a detective camera a photograph of a stand in an exhibition, well lighted?—ERNE THOMPSON.

3755. Retouching.—Will a brother amateur kindly tell me how to retouch a negative cheaply, and also tell me how to fill up pinholes, and also retouch a photograph, and oblige, as I am only a boy amateur?—ERNE THOMPSON.

3756. Enlargement Film.—Can any gentleman inform me if there is a process by which enlargements from cartes-de-visite can be obtained on canvas, and then fixed, so that it can be finished in oil? If so, where obtained, and cost of same?—E. N. N. K.

3757. Transparency of Shadows.—What is meant by saying that prints obtained by this or that process "show great transparency in the shadows of the picture"? The only meaning I have up to the present attached to transparency is that of being able to see through glass, water, air, etc.—A BEGINNER IN PHOTOGRAPHY.

3758. Pyro Potass Developer.—The Rev. W. Aston gave a formula for a pyro potass developer in vol. vi. I have lost the number containing the formula. Could anyone kindly oblige with the same?—GAEL.

3759. Isle of Man.—Will some friend say the exposure suitable for the interior of the Isle of Man, as compared with Wormald's tables? Also how quick might I work the shutter, and with how small a stop for hand-camera work, in Douglas Bay, in July, in the best light, using Ilford ordinary plates, and an $8\frac{1}{2}$ in. focus half-plate R.R. lens on a quarter-plate camera? Any hints on hand-camera work will be highly esteemed.—SNAPMAN.

3760. Focus of Lens.—I wish to use an $8\frac{1}{2}$ in. focus, half-plate R.R. lens on a detective camera. What is the distance, practically, beyond which everything will be in focus with such lens?—SHOOTIST.

3761. Lens.—Will some brother amateur be kind enough to give me the following information:—I have a half-plate R.R. lens of 10 $\frac{1}{2}$ in. focus; back combination, 15 in. focus; and front ditto, 18 in. focus; stops measure, No. 1, 1 in.; 2, $\frac{1}{2}$ in.; 3, $\frac{3}{4}$ in.; 4, $\frac{1}{2}$ in.; 5, $\frac{1}{4}$ in.; 6, $\frac{1}{8}$ in. What is the relative exposure for each stop?—P. K. F.

3762. Sensitometer and Plates.—Would someone kindly tell me the method of changing the

SPEN VALLEY PHOT. SOC.:—The ordinary monthly meeting was held on April 15th, the President (Dr. Farrow) in the chair. Mr. E. Hirst read a paper, and gave a demonstration on "Aptus Sepiatype Paper." He spoke of the simplicity of the process, and the beautiful results which can be obtained on this paper. The paper is printed out in a good light, and then after steeping for a short time in water, only requires fixing in a weak bath of hypo, and then after a few hours' washing, drying, either slowly, when an even sepia tone is obtained, or more rapidly before the fire, which gives a pleasing variety of tones. Mr. E. Smith read an interesting paper on the "Preparation of Lantern Slides," stating that in his opinion the wet collodion process gave the best results, but for more easy working the commercial gelatine plates. Mr. A. H. Knowles read a paper on the "Rapid Drying of Negatives," by immersion in methylated spirit after washing, and said that the only drawback to this process was, that occasionally the film became covered with a milky deposit, which, however, could be easily removed by re-washing the negative. The President made some remarks on the best size of negatives for amateurs to take, stating it as his opinion that the quarter or half plate was quite large enough, and that if larger pictures were desired, these could easily be obtained by enlarging. The general feeling seemed to be in favour of the half-plate size. The first excursion of the season took place on April 8th. The spot selected was Ilkley.

WEST SURREY AM. PHOT. SOC.:—A meeting was held on the 23rd ult., at Crichton Hall, Clapham Junction, Mr. Winsford in the chair. The subject for the evening was "Photography AfIELD," by the President (Mr. Gale), illustrated by a fine collection of his own slides, shown on the screen by the oxy-hydrogen light. The lecture throughout was listened to with the greatest interest, as was evinced by the frequent bursts of applause, both at the remarks of Mr. Gale and the fine examples of his work. The next meeting, fixed for the 7th of May, will also be of an interesting character; on that occasion Mr. Davison will give a practical demonstration of the platinotype process, when visitors will be welcome.

number of times plates into the number of the sensitometer?—R. E. S.

3763. Copying.—I wish to take a copy of some cartes-de-visite, using a quarter-plate camera and ordinary plates. Which is the best way to do it?—W. H.

3764. Plates for Copying.—What is the best way and plates to take portraits of, say, a large picture from the *Graphic*; also paper for prints from same?—J. E.

3765. Adapting Camera.—Can I make an arrangement to fit in dark slide groove of quarter-plate camera to take half-plates, using perhaps a half-plate lens? I thought perhaps a bellows affair would do it.—R. M.

3766. Eikonogen.—Will any reader who has developed with Eikonogen please tell me how it is that I fail to obtain density, using the maker's formula? The high lights of the prints obtained are very much discoloured. Negatives developed under exactly the same conditions with pyro give good results.—A. C.

3767. Lamp.—Where can I obtain the chimneyless and the new form of paraffin lamp burners? Cannot these be obtained without the entire lamp? The dealers in our town will neither supply me with burners nor address of makers.—DARK-ROOM LAMP.

3768. Binding Lantern Slides.—Can anyone give me hints for binding neatly and effectually lantern slides? I find the bindings are apt to crack off. Hughes has a system for metal binding; of its desirability I know not, but its expense precludes its use.—B.

3769. Ryde.—Can any brother amateur give a few places and objects of interest in Ryde and neighbourhood, as I intend to spend a fortnight there at the end of May?—SEPTIMUS.

3770. Hockin's Camera.—Will any amateur kindly give me his opinion of Hockin's instantaneous cameras, as advertised in this paper; also mention faults, if any?—LANGHAM.

3771. Chiswick.—I should like to know if there is any Photographic Society at Chiswick, as, being a resident in that neighbourhood, I should like to join one? Perhaps some of your readers can inform me.—G. B.

3772. Scratches on Burnisher.—I have one of Abraham's $\frac{1}{2}$ Reliable burnishers. After I have burnished one or two photographs I find the bar gets scratches on it, spoiling photographs. How is it? Can any reader kindly put me right? I mount photographs with starch, thick as blancmange; not pulverised starch.—SCRATCHES.

3773. Instalments.—Would any reader inform me of a firm which accepts monthly payments for photographic apparatus, etc.?—INSTALMENTS.

3774. Development of Instantaneous Printing.

—Will some expert oblige me with instructions as to the best formula and method of developing instantaneous pictures of animals in motion, etc., with hydroquinone or eikonogen? I do not work pyro-ammonia. Should the developer be weak, strong, or normal, etc.? Plates, Wratten and Wainwright's Drop Shutter Special.—**ASHTON.**

375. Glass for Dark-Room.—Will any amateur photographer kindly inform me whether the light obtained by the use of green and orange glass, instead of ruby, is safe? Also please tell me where I can obtain the green glass.—**F. HUGHES.**

QUERIES UNANSWERED.

Mar. 7th.—Nos. 3528, 3530, 3531, 3551, 3554, 3556.
14th.—No. 3566.

21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3601,
3610, 3612, 3613, 3614.

28th.—Nos. 3620, 3629, 3630, 3633, 3634, 3636,
3637, 3638, 3640, 3641, 3643, 3650, 3653.

April 4th.—Nos. 3661, 3664, 3674, 3677.
11th.—No. 3684.

18th.—Nos. 3703, 3708, 3709, 3711, 3715, 3718.
25th.—Nos. 3727, 3731, 3735, 3736, 3742, 3744,
3747, 3748.

ANSWERS.

3123. Tone.—Print on aristotype paper (deeply. Tone, without washing, in Hyposulphite of soda 10 ozs.
Chloride of gold 3 grs.
stopping when toned to colour you want. No fixing required.—**Q.**

3652. Alum.—Alum and chrome alum are both used for hardening the film; but the latter only in cases of bad frilling, it having greater hardening action. Alum answers well in ordinary cases, and is much cheaper.—**Q.**

3672. Toning Trouble.—Cause: precipitation of gold. Remedy: mix a fresh bath. Gold will not pay for the trouble of recovery. Keep your toning baths in the dark when not in use. They are less likely to precipitate the gold.—**Q.**

3705. Ireland.—If "Medici" cares to write to me I shall be glad to give him any information I can.—**J.** (address with Editor).

3721. Dorking and Gomshall.—If "Cockney Amateur" will write me, I shall be pleased to give him the information he wants; but I know of no book on the subject. Address with Editor.—**Q.**

3722. Budleigh Salterton (South Devon).—Well worth a fortnight. Haunts: Sidmouth, Ladrum Bay, Straight Point, etc.; all with good subjects. The well-known river Otter abounds in "bits." Best time, June to July.—**BRUSH.**

3722. Budleigh Salterton (South Devon).—Certainly. It is a pretty place, and in the neighbourhood you will find many photographic bits. I should say you could manage three dozen pictures with the greatest ease.—**W. A. J. CROKE.**

3723. Animals at the Zoo.—The reply to "G. N. Fell," in last week's "Editorial" might help you.—**Q.**

3726. Gravestones and Tablets.—This would seem to be about the simplest form of photography. Two things, however, might be noted. The lens should be well stopped down to secure sharp definition, and in the case of tablets the plate should be accurately parallel to the tablet to secure squareness. N.B. Swing-back should be used if necessary.—**GREENWOOD.**

3725. Scratched Film.—Only retouching both on the negative and print, but great care must be taken.—**W. A. J. CROKE.**

3728. Scratched Film.—If the scratches are few and small, they might be carefully stopped out with a fine sable pencil and Indian ink. If they are many and large, the case is hopeless.—**GREENWOOD.**

3729. Printing-out Paper.—Sulphuric acid and water will remove films from plates, with the help of a stiff brush.—**Q.**

3730. Bicycle Carrier for Camera.—I carry my half-plate camera and three dark slides on a Premier Safety bicycle, in a double saddle-bag, made of waterproof cloth, slung on the backbone of the machine (camera in one pocket, and slides, etc., in the other, to keep the balance true). The bag cost 10s., at Jas. Valentine and Co.'s, 15, Bishopsgate Street Without, and is a most satisfactory investment, as it can be used to carry clothes in when not required for the camera. I shall be happy to show the arrangement to "S. C. H."—**E. W. T. WARD.**

3732. Quarter-Plate Camera and Set.—I should advise "Amateur Beginner" to go in for a quarter Instantograph, by Lancaster, and to buy his chemicals, dishes, etc., separately, and not in a set, as they come much cheaper. I have found the Instantograph all that could be desired for a beginner's camera.—**W. E. DOBSON.**

3732. Quarter-Plate.—For the price you cannot beat a Lancaster. It is best not to get the set, or, in fact, any set, as many things are superfluous that are in them.—**EIKO.**

3732. Quarter-Plate.—Lancaster's quarter-plate Instantograph is a very suitable camera to put into the hands of a beginner. I should also recommend you to obtain Mawson and Swan's "Photography simplified," and study it carefully.—**T. D.**

3733. School of Photography.—There is a School

of Photography at the Polytechnic, Regent Street, W.—**Q.**

3733. School of Photography.—I know of no school, but several firms give free lessons to purchasers.—**W. A. J. CROKE.**

3734. Magnesium.—I find half an inch of ribbon one foot away plenty with Alpha plates. To ignite, let the smoke of a match (lighted) be first applied, gradually bringing it nearer the ribbon, when it will soon burst into flame.—**EIKO.**

3737. Shutter.—I have one of Tylar's Norden Flap Shutters fitted to a stereoscopic camera, and am very well satisfied with it. It gives no vibration, and it can be altered to give with the same tension exposures of varying efficiency, that is, either to close as soon as fully open, or else to remain open for an instant before commencing to close.—**SUDDOCK.**

3737. Shutter.—There is a danger of vibration with the shutter you mention. Dewey's drop is better at the price; in fact, with any simple drop there is less chance of vibration.—**EIKO.**

3738. Carbonate of Potash, or Soda.—Carbonate, and not bi-carbonate, is meant in the formulas. Note difference:

Potass. carb.	...	...	...	KO ₂ C ₃
Potass. bi-carb.	...	...	...	KHCO ₃
Soda carb.	...	...	...	Na ₂ CO ₃ .10H ₂ O
Soda bi-carb.	...	...	...	NaHCO ₃

—**Q.**

3738. Carbonate of Potash or Soda.—The bicarbonate is always meant. The bicarbonate is useless.—**GREENWOOD.**

3739. Easing Bridge is about three miles from Godalming. Go along Portsmouth Road; after crossing under railway arch about fifty yards, take a road to the right, up a very steep hill, sign-posts after that. There is another way through Milford, not so steep. I should say (early morning or) late afternoon. I took a photograph about 3 o'clock, very good, but bridge rather in shadow. Set up camera (below bridge) on tongue of land between the two streams, get an old willow tree into the foreground.—**E. A. DUFF.**

3740. The Instantograph Shutter.—Mr. Meldon has tested the speed of this—I think he found it to be about one-thirtieth of a second.—**GREENWOOD.**

3741. To Cut Plates.—I have used a sixpenny American glass-cutter for the same purpose, which was quite effective.—**T. D.**

3741. To Cut Plates.—If you cannot afford a diamond—which is the only way to cut glass plates—get a maker to do it for you.—**W. A. J. CROKE.**

3743. Swinden and Earp's Hand-Camera.—With this camera no scratching of plates can occur. It works well, but all workers of hand cameras must expect failures. I have one of their hand-cameras, and believe it the best in the market; it holds 20 quarter-plates.—**F. H. KNIGHT.**

3745. Enlargements.—Place the film on a piece of clean glass, film side out, and hold in its place with two narrow rubber bands.—**GREENWOOD.**

3746. Negative Exchange Club.—I started one some time ago. If you will communicate with me, through the Editor, I will put you down for the first vacancy.—**W. A. J. CROKE.**

3749. Detective Camera.—You cannot possibly get a better one than Abraham's "Ideal." It is better made than most at the price, the shutter is self-setting, and time and instantaneous exposure can be obtained. The Facile is good, but the shutter will not bear comparison with the Ideal.—**EIKO.**

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED:AM:PHOT:**

H. HOLT.—We quite endorse your opinion about "pot hunters," and hope that every possible restriction will be enforced to prevent the exhibition of previously medalled pictures.

J. PRIE.—We have your letter, and it shall receive attention in due course; sorry we did not see you.

W. A. WATTS.—You shall hear from us.

H. MACLEAN.—Should not think it at all likely. Thanks for addresses which have been hunted up.

P. CHAS. COULTAS.—Of course we quite understand the position; the circular should not have been sent to you.

GEO. LYNAM.—We forwarded the particulars.

E. HOBBS.—Thank you very much; if in the district, will certainly call upon you.

E. J. TAPSON.—You will find several formulae in quite recent numbers. Recently two were quoted in this column.

MISS MARIAN ROOTS.—Ladies can enter their photographs under any or all of the subjects named.

The size of picture and selection of mount is, of course, left to the judgment of the competitor; we cannot advise.

MARIE DE MEUDON.—Certainly write to the Colonel of the Regiment, he is not likely to object. Make up your own toning bath; see "Experimental Photography" (Leaper). You will find no difficulty in "making up" pyro and ammonia developer. We do not at all counsel the purchasing of ready-made developers or toning baths. Thank you for speaking up for the AMATEUR PHOTOGRAPHER. We should think it very unlikely that you would be able to divide off the room as you suggest for a dark-room. We may very shortly give one.

ARTHUR FANE.—Thank you for your most interesting letter; certainly we shall be pleased to criticise your work, and shall be glad to hear from time to time of your doings and the progress you are making.

B. C. DOYLE.—The best lens is A and the next C, but for your work we should recommend the former.

W. S. T.—We have every reason to believe that you will find C a good film. The lens F is a very perfect instrument. The camera you name we have not seen, but, unfortunately, they are badly finished; if you buy one, have it sent to us, and we will examine it for you.

W. M.—You would find B plates give you greater latitude in exposure, and in our hands they never frill. We will take your photographs in their order: No. 1, too much foreground, badly focused, no detail brought out; No. 2 is a very good print from a capital negative; No. 3, it is very difficult to secure a good picture with such bright sunshine, the flags in right-hand corner are an ugly patch upon the print; No. 4, far too strong a light, no detail brought out; No. 5, a good study of trees, but otherwise very uninteresting, exposure is about right; No. 6 is a very charming picture, the print looks as though it is from a stained negative, detail is fairly rendered, and it is the best. Nos. 7 and 8 are hard. Why not try ferrous-oxalate. Your remarks about the fluid we are sorry to say we cannot understand. D: this apparatus is really of little use, it is made like the razors, to "sell."

G. B.—The nearest is the West London Photographic Society; the Secretary, Mr. John A. Hodges, 87, Chancery Lane, London, E.C., will give you all information.

A. F. JONES.—"Folkestone Harbour," a little hard. Your negative is probably a thin one. You should have endeavoured to have got in the whole of the masts, which could have been done had you sacrificed foreground, which could have been spared. The "High, Oxford," is a very fair street scene, but has no claim to be called a picture. "Mayfield, Sussex," would have been better if the exposure had been shorter, and the picture would have been much helped by a group of cottagers, or their children. The prints are returned; also entry form for "Monthly Competition."

HECTOR MACLEAN.—All right. We will have something to say later on.

B. W. GILBERT.—Thank you very much. Our attention had been called to the notice in the *Birmingham Daily Gazette* of the 28th ult. We are also obliged to you for bringing the matter to our notice.

SEPTIMUS.—Your lens does not give good definition in the portrait. No. 1 and 2 are both rather over-exposed. Do not be anxious to use rapid plates. The point of view of No. 2 is good; but you will notice that definition is lacking. No. 3 is very fair, but your foreground is much too vast. If you like to send us particulars of lens, stop, exposure plate, and developer, we may help you more. Prints are returned.

B. S. P.—Your photograph is evidently from a thin negative, and is much over-printed. You should not expose such a negative to strong sunlight; if you do, cover it with tissue paper. Photographs of animals may be entered in the next "Monthly Competition." All prints must be sent in on or before the 14th of May. The lens is a good one, and seems to give good definition. The ordinary acetate bath will keep fairly well if you use distilled water, and do not allow actinic light to get to it.

D. R. CLARK.—Please send on prints at your convenience. We notice the excellent reproduction from your negative which is published in the *Art Review*.

FRAS. L. FITHER.—We have handed your letter to our publishers.

RASHLEIGH PORTER.—All right; we will express no opinion. You will find us "at home" on Mondays from 2 to 5 o'clock, and on Thursdays from 11 to 1 o'clock. Send a post card if you are coming up any other day, and say time. Shall be delighted to see you. If you want to read shutters, buy "Competitive Papers No. 1," is, published by us. There are several capital articles in it, and a good deal of other useful information. Delighted with your letter.

EAGLESBUSH.—No. 1 is thoroughly reliable, and the R.R. lens is a first-class instrument. We are pleased with No. 2, and if thoroughly examined will do good work. It is smaller, lighter, and more compact than No. 1, but has many more movements. The shutter sent out with the new ones is very perfect, both for time and instantaneous work.

S. C. HOVENDON.—Thank you. We have sent on

full particulars. Glad you found the paper all right.

R. C. B.—We cannot recommend any under A. 1 and 2 are identically the same, the best part of them being the shutter; 3 has circular plates, but gives good pictures, only small; 4 we know nothing about. B, answered above. C, better wait and buy the camera you name. If you have the single lens you will be well pleased, and could always fit an R.R.

H. W. O.—You have secured a reversal of the image, due to the extreme action of light. There is no remedy. The plate is spoilt. We should certainly prefer lens No. 1.

J. S. H.—You will find a very excellent description of platinotype printing in the "Dictionary of Photography." The image is only faintly visible before development.

ST. JOHN.—Yours is a very charming letter, but it is difficult to answer in this column. Could you not call upon us next Monday between 2 and 5? For shutter, we should advise the No. 1 "time and instantaneous," No. 8, or No. 9; these are all for hood, which we should recommend. The size of stop must depend upon your subject, and your light also upon the speed you work the shutters. See note to "Rashleigh Porter." Of the hand-cameras, certainly No. 1. The No. 2, in answer to "Eaglebrush," is your No. 3. No. 2 is "bricky," but we fear, not reliable. If you call, we can show you No. 1 and No. 4, and talk about the others.

L. H. K.—If you write a line to Mr. E. B. Goddard, Eaglehurst, Wallington, Croydon, he can help you. The make of lens are certainly of the very first quality, but we cannot say what your lens will do without first seeing it. You may, however, rest assured that whether it is an R.R., W.A., or portrait it will do good work.

A. GEORGE.—The only way in which you could do what you wish would be to use the transferotype process, and we fear you would have considerable difficulty with it. Could you not cut the print the exact size of panel, and then varnish the whole?

B.—We do not name apparatus. There are, however, many very excellent cameras, etc., in the market suitable for taking negatives expressly for lantern work. Go to a first-class dealer.

TRY AGAIN.—Your lens is evidently not rapid enough. We should advise you to have No. 2; a splendid lens, and particularly adapted for hand-camera work. No. 1 is said to give good results, and we have seen such, but have not used. No. 3 we feel certain would not satisfy you.

E. B. GREENWAY.—You will find the turntable of very great advantage.

W. G. G.—You had better give us a call. Sorry the letter to "F. R. C. S." has not reached him. Unfortunately, his address was not registered. Seeing this, he may reply.

GEORGE A. MILLER.—You cannot have better than *b* or *d*; they are both quite perfect for hand-cameras with dark-slides. We have no choice in them. Perhaps the lens in *d*, which is made by the firm, is the best.

H. F. LINGING.—You say, "I crushed the bi-sulphate of soda." If you look at page 294, you will find that you are told to use bi-sulphite. This will probably account for your difficulties.

FRED W. BROCK.—(1) Portrait. (2) Portraiture. (3) Probably cabinet. (4) Impossible to say. We believe good work may be done with the lens.

J. G. C.—(1) If you can buy that lens for £6, and it is in good order, you have a bargain. (2) Certainly not, unless it has been roughly used. (3) Not to be compared. The list price of such a lens is about £15.

H. RENDALL.—We believe No. 1 to be good, the others we know very little about.

K. B.—The lens is a cheap French lens, giving fairly good definition. It would not be worth while to have a mount made for the other, which is probably the front combination of an R.R. Your second letter: In using pyro be careful as to quantity, and add citric acid—say 1 in 4.

F. T. BENNETT.—Why should you doubt the makers, and why should we test it; they surely know their own paper? We know the writer of the letter, and should advise you to follow his instructions.

F. G. BEECHING.—Thank you, we may write you, BEGINNER.—We are writing you.

SNIP.—"A Rehearsal" is not well lighted, retouching is carelessly done, the music stand is frightfully out of focus, and is a quite unnecessary accessory to the picture. What lens was the picture taken with? The work sadly lacks definition. Nos. 1 and 2: the white dress is a great mistake, especially with one so fair; you have no detail in it, the light is all on the dress. You have the flowers in sharp focus, and the sitter is out of it. We should advise you to study "Pictorial Effect" (Robinson), and not to try to take photographs of figures in a conservatory. You will in all probability sacrifice the figure or the flowers, and don't take ladies in white dresses. Let us see your work in six months, you might then, perhaps, enter one of our competitions.

P. ELLIS.—For the "Travelling Studentship" photographs of any size may be entered for competition. We have no entrance fees. The fact of entering a print in one of our "Monthly Competitions" will disqualify it for the "Travelling Studentship" or any other competition. If the

print is from a negative taken by yourself, you may enter.

J. MOUNTFORD.—At an artist's colourmans, or any shop where they sell drawing materials.

Q. R.—The stains may be from pyro, silver, or a dirty fixing bath; had you fixed silver prints in the same bath?

PYRO.—The muddy appearance of the developer is due to the fact that ferrous oxalate is soluble in excess of solution of oxalate of potash, not in water; care must be taken to keep the potash in excess, see "Dictionary of Photography," pages 40 and 41. 2, We prefer the ordinary 10 per cent. solutions.

E. L. H.—You give no address. Our rule is to have every query endorsed with name and address, we therefore, must hold over our reply.

E. H. JEFFREY.—Shall be very glad of photographs for hospital albums. The address shall be given if applied for.

AMATEUR.—Your letter is quite unintelligible, and has been consigned to the W. P. B.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within two DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer."—AMATEUR PHOTOGRAPHER, 1889, perfect, 4s. 6d.; clearing out sundries, cheap, returnable list, approval.—No. 10, Albion Street, Miles Platting, Manchester.

Apparatus.—Quarter rapid portrait lens, with stops, and rack and pinion, focussing, 16s.; two whole-plate metal dark-slides to Lancaster's Instantograph, only used once, 11s.; 50 numbers of AMATEUR PHOTOGRAPHER, 4s.—B. S. Proctor, North Road, Coudridge.

Half-plate Instantograph lens and shutter, nearly new, 20s.; also folding tripod stand, scarcely used, 10s.—Lex, 23, Eustace Street, Dublin.

Underwood's extra-rapid portrait and view lens, with Iris diaphragms, working at f/8, never used, 14s.; feather-weight double back, 3s. 6d.; Lancaster's double back, cost 12s. 6d., for 8s. 6d.; Lancaster's Instantograph shutter, 5s.; Lancaster's tripod head and stand, 5s.; all half-plate lot for 30s., or exchange to value.—Fairweather, Stroud, Glos.

5 by 4 camera, three double backs, one single, 16s.; case for above, 4s. 6d.; three porcelain 5 by 4 dishes, 1s. 3d.; 5 by 4 plate box, 10d.; Decoudun's photometer, 7s.—Address, C. 32, Lingfield Road, Wimbeldon.

Hare, Lind Road, Sutton, Surrey.

Backgrounds.—Backgrounds, three pretty exteriors, flatted oil, rollers, 8 ft. by 6 ft., rustic summer-house, ivy, trees, etc., stone arch, creepers, landscape, etc.; 10s. 6d. each.—Hill, Hampton Road, Twickenham.

Bicycle.—Facile bicycle, in thorough condition, good climber; exchange for whole-plate camera and lens, or enlarging lantern.—15, Harvard Road, Lewisham.

Burnisher.—10 in. burnisher (the Useful), nearly

new, Bunsen burner; buyer pays carriage.—A. Spiller, Hillside, Hampstead Hill Gardens, N.W.

Cameras.—Lancaster's half-plate Meritoire, with lens, stand, five double backs, and waterproof case, complete; 65s.—Stott, Mumps, Oldham.

5 by 4 long-focus Tourist camera, brass-bound, reversing back, three double backs, and case, as new; price 80s.—Seen any time at 194A, Mare Street, Hackney, N.E.

Mahogany half-plate Tourist camera, leather bellows, rising front, double swing-back, reversing back, new condition; 32s. 6d.—43, The Grove, Vauxhall.

Cameras, etc.—Hare's whole-plate patent camera, with Russia leather bellows, three slides, two leather travelling cases, inner frames, stand, and instantaneous shutter; cost £21 10s.; cash £10.—F. D., care of Watson and Sons, 313, High Holborn, London.

8½ by 6½ square reversing-frame camera, and three double backs (by Meagher), in condition equal to new, with solid leather case and sliding leg stand; cash £7 10s.—R. B. M., care of Watson and Sons, 313, High Holborn, London.

Camera, quarter-plate portrait lens, tripod, and single dark-slide, suit beginner; price 25s.—Saunders, Rosedale House, Clevedon.

Exchange McKellen's quarter-plate camera, three double backs, and No. 2 Ross' portable symmetrical lens, for good quarter-plate detective camera or cash.—A. Barlow, Cornbrook Works, Manchester.

For sale, modern whole-plate camera, conical bellows, three double backs, all movements, the whole complete in mahogany case.—Address, Bond, Bodmin.

Quarter-plate Instantograph camera, fitted with Eastman's roller slide, three double backs, in case, £3 10s.; Thornton-Pickard time shutter, 1½ in. hood, as new, 10s.—G. Constable, Market Street, Lewes.

Half-plate square bellows camera, three double backs, rising and cross fronts, swing-back, rapid single landscape lens, revolving stops, instantaneous shutter, the whole almost new, and tripod stand; bargain, £4 10s.—Address, C. 32, Lingfield Road, Wimbeldon.

For sale, Lancaster's quarter-plate Meritoire camera, in thoroughly good condition, with lens, three double dark-slides, and tripod stand; cost two guineas; will take 30s.—F. W. Sears, 1, Creed Lane, Ludgate Hill.

Lancaster's quarter Instantograph (1888), complete, with shutter, seven metal slides and adapter, printing frames, six developing trays, focussing glass, etc.; £3; apply after 6.—Newman, 201, Brick Lane, Bethnal Green Road, E.

Universal studio camera, new, half-plate, double swing-back, screw adjustment, £23; also portrait lens, rack and pinion, cost 5s, take £2.—Beckett, 10, Red-hill Street, Regent's Park.

Camera, lens, etc.—Optimus Euryscope lens, 7 by 5, good as new, £3 3s.; also quarter-plate Instantograph camera, 1888, lens, shutter, three double backs, tripod, and case, good condition, £2 10s.; also Lawley's quarter-plate portrait and view lens, with extra flange, 15s.—Mrs. Cole, Chaplain's House, H.M. Prison, Lewes.

Canoe.—Exchange splendid clinker-built canoe for photographic set, hand-camera, or Safety bicycle; approval.—P. F. Hayden, Graigue, Kilkenny.

Enlarging Apparatus.—Marion's enlarging apparatus, 7 in. condensers, new, cost £7, further particulars if wanted; would exchange for f/7 rapid rectilinear lens by good maker.—H. Wigan, East Malling Vicarage, near Maidstone.

Hand-Cameras.—Hand-camera, for 2½ by 2½ plates, lens, shutter, six sheaths, and four dozen dry-plates; will take 15s.; giving up photography.—Toodie Young, Guilford Lodge, Brentwood.

Kodak, with new roll, 100 films, perfect, hardly used; 55s.—Stevens, 209, High Street, Sheerness.

Facile hand-camera, rectilinear lens, finder, as new; £3 5s.—Ruddock, 59, Plantagenet Street, Cardiff.

Kodak, quite new, 60 exposures; 50s.—Ellis, 7, Park Village West, N.W.

Fallowfield's Facile camera; cost £5; take £4; good condition.—Whiteside, St. Nicholas, Cardiff.

Diamond detective camera, perfect condition; 20s.—E. Galloway, Gladstone Terrace, Gateshead.

Induction Coil, etc.—New ½ in. induction coil, polishing lathe, and 6 in. fan; will exchange for photographic goods.—Ord, Chemist, Scotswood Road, Newcastle-on-Tyne.

Lenses.—Two Ross' rapid symmetrical lenses, whole-plate and 10 by 8; price 5 guineas and £6 15s. respectively; both in perfect condition, practically new.—Cross and Johnson, High Street, Exeter.

A first-class 12 by 10 triple applanistic view lens (by Voigtlander, No. 11,327), it is an old pattern, with stops at back of lens, 16 in. focus, very rapid, gives perfect definition, and works well for portraits or groups; will exchange for a complete quarter-plate hand-camera by any good maker.—Charles Oetzmann, Brighton Road, Surbiton.

Lancaster's R.R. lens, half-plate, focus 8½ in., Iris diaphragm, as good as, and nearly new; £2.—Col. Ogle, Eastney Barracks, Portsmouth.

Half-plate W.A. lens (Lancaster's), Iris diaphragm, with adapter for Rectigraph lens; £1.—54, Chester-gate, Stockport.

Exchange 12 by 10 single view lens for whole-plate view lens, or offers.—Hocking, High Street, Colchester.

Lancaster's half-plate rapid Rectigraph; cost £3; for 45s.; or exchange good magic lantern or hand-camera. Half leather bellows camera, all movements; 20s.—Pollock, Telegraphs, Belfast.

Hockin's whole-plate R.R. lens, new, complete; 38s.; cost 50s.—H. Curtis, 29, Longford Street, N.W. Lens and Shutter.—Grubb's A2 portrait lens and Abraham's Eclipse shutter to fit; cost, new, 114s. 6d.; take 60s., or exchange for whole-plate Optimus R.R.—Christie, Rectory, Newtown Stewart, Ireland.

Half-plate triple achromatic lens (by Dallmeyer), with instantaneous shutter, pneumatic release; 52s.—Naylor, Iver, Ealing.

"Photo. Soc. Reporter."—First volume, PHOTOGRAPHIC SOCIETIES' REPORTER, bound; what offers in cash?—55, AMATEUR PHOTOGRAPHER Office.

Photometer.—"Perfect" photometer, 6s. 9d. post free, strong two-fold ash stand, with triangular top, cost 18s. 6d., height 5 ft. 8 ins.; 10s.; carriage paid.—Ellam, Yarm.

Plates.—Twelve dozen Thomas's E.R. quarter-plates for 10s., carriage paid.—W. A., care of Publishers.

Rubber Stamp Apparatus, make 3½ in. by 2 in., full instructions; exchange for quarter-plate rapid rectilinear lens, good name, or offers photographic apparatus.—Ashley, 52, Greenhill Street, Manchester.

Sets.—Underwood's 1888 Instanto camera, dark-slide, tripod, R.R. lens; cost 5 guineas; bargain, 70s.; new.—Slade, Slad Road, Stroud, Glos.

Quarter-plate camera, double swing-back, etc., lens and shutter, portable tripod; a genuine bargain, for 37s. 6d.; cost £23 10s.—G. Maxwell, Chester-gate, Macclesfield.

Quarter-plate camera (by Photo Artists' Stores) single view and wide-angle lenses, 6 Tylar's metal slides, stand, and shutter, complete in solid leather case, perfect condition; £3; approval.—W. P., 39, Holford Square, W.C.

Diamond hand-camera, new, takes 12 plates, c.d.v., R.R. lens, finder; 23s.; or will exchange for a long-focus single lens or quarter-plate camera or R.R. lens.—S. L. C., 78, Collyhurst Street, Manchester.

Quarter bellows camera, double back, lens and stand, in box, with lamp and printing frames; cost £2; price 15s. 6d.—Ashley Lodge, Crouch Hill.

Quarter-plate camera, all movements, lens, three Tylar's double backs.—Apply, Monument Road, Post Office, Birmingham.

Quarter-plate set, everything complete, price 28s. 6d., bargain; half-plate rapid rectilinear lens, 27s. 6d.—View, 8, Leigh Road, Highbury.

Half-plate outfit, best London make, square bellows camera, double swing, rising and cross fronts, three double backs, rapid rectilinear lens, solid leather case; sell or exchange for whole-plate outfit.—Address, The Butler, the Lodge, Halifax.

Lancaster's International half-plate camera, good as new, two double slides, carriers, lens, shutter,

tripod, and waterproof bag; £4.—M., 71, Wadham Road, Bootle, Liverpool.

First-class half-plate set, rectilinear lens, Thornton shutter, stand, bag, etc.—Particulars from Cooper, Chestergate, Stockport.

Ross' whole-plate camera, lens, stand, with carriers for half and quarter, and two slides in leather case; price £55s.—J. V. Ramsden, Willinghurst, Guildford.

Marion's 5 by 4 camera, lens, double dark-slide, and tripod, quite new, scarcely used; price 23s.—Hawkins, Panton Street, Roehdale.

Lancaster's half-plate International camera set, with accessories and fittings, splendid condition, also pair lanterns, with dissolving-view apparatus, complete; sacrifice, £4 18s.—A. D. Clarke, Pailton, Rugby.

Lancaster's quarter-plate camera, with lens, one double back, and tripod; price 20s.—F., 5, Wymond Street, Putney, S.W.

Slides.—Six Tylar's whole-plate metal slides, fits Tylar's camera; new; sell lot or divide; cash offers or exchange.—315, Crookesmoor Road, Sheffield.

Slide and Burnisher.—Excellent quarter double slide, also half-plate burnisher; sell or exchange. Wanted, Aptus finder.—Blyth, Ilfracombe.

Sundries.—Sundries for sale, amateur giving up; the lot for 10s.; list sent per stamped envelope.—Elmore, Mountnessing, Brentwood.

Violin.—Will exchange quarter-plate Instantograph 1890 and splendid old violin for half-plate Instantograph 1890, or for cash.—W. Welch, 3, Spital Street, Sheffield.

Virtue's "Palestine."—Virtue's "Picturesque Palestine," issued to subscribers only, complete in 4 vols., well-bound, half morocco, gilt edges, first-class condition; cost (including binding) £7 2s.; exchange for good half-plate set; the lens must be suitable for instantaneous work.—Rev. Irwin, Attleborough, Norfolk.

WANTED.

Cameras.—Whole-plate camera, double back, stand, no lens, must be a good maker's, in perfect order, cheap, on approval.—Mrs. Colvill, Olde House, Shrewsbury.

Quarter-plate camera.—State make and price to S. Kirkham, Court Place, Carlrow.

Whole-plate Chapman's British or other neatly and strongly-made long extension camera, must be in good order, and cheap.—F. B., 28, Winnington Terrace, Northwich.

Camera, etc.—Camera and lenses, 5 by 4 camera, dark-slides, lenses by good makers; state full particulars and price; approval.—W. Ray, Science School, Kidderminster.

Camera Backs.—Two half-plate Instantograph backs.—Emeny, 7, Cadogan Terrace, Victoria Park, E.

Camera Case.—Case for half-plate camera and three double backs.—Taylor, Tannery, Marple.

Hand-camera.—Hand-camera, quarter-plate, latest improvements, perfect condition; approval.—Gardner, Haglesbush, Neath.

Lenses.—Eurycope lens, about 9 in. focus.—Photographer, 84, Park Street, Bristol.

Half-plate wide-angle lens; state particulars; approval.—Turner, Woodville, Lytham.

Wide-angle rectilinear lens, about 3 in. focus, Wray, Ross, or good maker, perfect; trial.—Burton, 84, Great Clowes Street, Manchester.

Sets.—Whole-plate camera, slides, tripod, long, focus.—Battell, 14, Queen's Road, Walthamstow.

Photographic apparatus, half or whole plate—cheap, for cash.—S. G., 154, Ecclesall Road, Sheffield.

Half-plate photographic outfit; lowest price and full particulars.—A. H., Grassington House, Prenton Road West, Tranmere.

Colloid Emulsion for Albatypes, Opals, Dia-positives, Lantern Slides, etc.,

PRODUCED DIRECT IN THE CAMERA.
In bottles (with full instructions for use), 5-oz., 2/6; 10-oz., 5/-; 20-oz., 9/-. Sample bottle, post free, 1/3.
Cold Drying Varnish, for above purposes, in bottles, 1/- and 2/- each.

Flexible Vignettes, ½-plate, 8d.; ¼-plate, 1/4; whole plate, 1/9 each.

All other sizes supplied for Landscapes or Portraiture.
TO BE HAD OF ALL DEALERS.
Prepared only by A. J. BANKS, Manufacturing Photo-Chemist, 45, FREEHOLD STREET, LIVERPOOL.

PLEASURE CRUISES to the LAND of the MIDNIGHT SUN.—The ORIENT COMPANY'S steamships GARONNE (3,876 tons) and CHIMBORAZO (3,847 tons) will make a series of TRIPS to NORWAY during the season, visiting the finest fjords. The dates of departure from London will be as follows, and from Leith two days later:—
June 4th, for 15 days | July 15th, for 15 days
June 18th, for 27 days | July 23rd, for 27 days
June 25th, for 15 days | Aug. 8th, for 21 days
The steamers will be navigated through the "Inner lead"—i.e., inside the fringe of islands off the coast of Norway—thus securing smooth water; those of the 18th June and 23rd July will proceed to the North Cape, where the sun may be seen above the horizon at midnight. The Garonne and Chimborazo are fitted with electric light, hot and cold baths, etc. Cuisine of the highest order. A

Dark Room provided for the use of Photographers.

Managers, F. Green and Co., 13, Fenchurch Avenue; Anderson, Anderson, and Co., 5, Fenchurch Avenue, London, E.C. For further particulars apply to the latter firm, or to the West End Agents, Grindlay and Co., 55, Parliament Street, S.W.

ENAMELLED DEVELOPING

NEW

DISH

SOLE MAKERS JONES BROTHERS & CO WOLVERHAMPTON

ROUCH'S "EUREKA" HAND DETECTIVE CAMERA.

GIVES instantaneous pictures eminently adapted for the Optical Lantern, Book Illustrations, or Sketches for the Artist; and is now in great demand by Tourists, Artists, Special Correspondents, and Missionaries. It differs from all others in its compactness, but is invaluable in this special feature, that when its contents of one dozen plates have been exposed the reservoir containing them may be removed **in open daylight**, and a second, third, or fourth reservoir, each containing twelve or more plates, may be inserted in succession, no dark tent for changing plates being now necessary.

Lens, Cameras, and all fittings of very highest class, and made on our premises.

The Improved "Eureka" is covered with several Patents.

Price complete—For Lantern size Plates, £5 17 6; Quarter Plates, £6 12 6.

If reservoir is made detached, 10s. each instrument extra. Additional reservoirs, lantern size, £2 5s.; quarter-plate, £2 10s. each. For all other high-class Photographic apparatus and material, send for ROUCH'S NEW ILLUSTRATED CATALOGUE, 130 pages, post free, 6d.

Awarded the only Medal for Hand Cameras at Crystal Palace Exhibition.

W. W. ROUCH & CO.. 180. Strand, London. Factory Entrance—43, Norfolk Street, Strand.

THE LATEST INVENTION IN PHOTOGRAPHY.

(H. J. REDDING'S PATENT, No. 17,328.)

THE "LUZO." Registered.

The Lightest, Most Compact, Simplest, and BEST HAND CAMERA IN THE WORLD.

A CHILD CAN USE IT.

THE "LUZO" is made of the finest Spanish Mahogany, finished in best style, and guaranteed to resist the most trying climates. It carries material for **100 Exposures**. It is fitted with a Rapid Rectilinear Lens of best LONDON MAKE, Improved View-finder, Patent Shutter (for time and instantaneous exposures), and used without removing it from the Case. Complete in Solid Leather Sling-Case, with full directions.

Each Camera is supplied ready charged with the New Transparent Film, which is developed in the same way as glass—requiring no stripping.

PRICES:

No. 1, for pictures 2½ in. square, ready charged for 100 exposures, £4 14s. 6d.	No. 2, for pictures 3½ square, ready charged for 60 exposures, £7 7s.	No. 3, for ¼-plate pictures 4½ × 3½ in. ready charged for 48 exposures, £7 15s.

[PRICE TWOPENCE.]

✿ OUR VIEWS. ✿

To hold as 'twere the mirror up to nature."—*Shakespeare.*

WE are asked to state that it has been thought desirable to take steps to form a Photographic Society at Ealing. Mr. H. W. Peal, of 2, Craven Terrace, Ealing, will be pleased to hear from ladies and gentlemen who may be willing to assist in the formation of a society.

* * * *

To those wishing to procure cheap guide books to assist them in selecting localities for photographic excursions, we can recommend the perusal of Longley's "Holiday Guides," published at 39, Warwick Lane, E.C. Some sixty have been issued at 1d. each; they should certainly be on the bookshelf of every amateur photographer.

* * * *

ON the 22nd inst. Mr. E. J. Wall will read a paper before the members of the Hackney Photographic Society, on "Photographic Chemistry."

* * * *

THE Photographic Exhibition at Newcastle-on-Tyne has been largely attended during the week. 150 slides by Mr. J. W. Wade, of Manchester, have been shown. A lecture upon "Stellar Photography" has been given by Alderman Barkas. To-night Mr. J. H. Gibson, of Hexham, repeats his lecture on "Northumberland, its Antiquities and its River Scenery," and on Saturday there will be a grand vocal concert. During the whole of the time, the exhibition has been largely attended, and the work of the executive has been admirably carried out.

* * * *

WE are pleased to note that "warm tones" are again coming to the front. We venture to predict that matt-surface prints, particularly Aristotype and Obernetter, will show largely at future exhibitions. The very heavy advance in price of platinum salts will tend to push forward other printing processes.

* * * *

THE Worcester Photographic Society intend to proceed this summer with a photographic survey; they have a par-

ticularly happy hunting-ground, and will be able to find much to interest their members and instruct the public.

* * * *

NOTWITHSTANDING some slight opposition being brought into play, the photographic survey of Warwick is being organised. The opposition must be a very strong one that can tell against such old organisers and practical workers as Ald. Stone and Mr. W. J. Harrison, especially as they are ably assisted by an excellent Committee of members of the Society. We can but think that all the photographic societies in the county of Warwick will join in the movement, help with the work, and so divide honours. Mr. Harrison's scheme is by far the most comprehensive of any that have been framed for the conduct of photographic surveys, and we are sure it will be a proud day for him and for Birmingham when prints of the first section are exhibited. Birmingham is the metropolis of the Midlands, and other towns should be content to help make up and work for the survey, rather than desire to cut out their own little piece. We hope Birmingham will not be discouraged, but that the members will cover the whole county and "quit themselves like men."

* * * *

THE Council of the Gloucestershire Photographic Society announce that they intend to hold their triennial photographic exhibition in October of this year. We wish them every success, and shall have more to say about the matter at an early date.

* * * *

WE notice that Mr. T. R. Dallmeyer will read a paper on the 13th inst. before the members of the Photographic Society of Great Britain, on "Reflected Images in Optical Combinations, and their Effect on the Brilliancy of the Final Image;" and Mr. W. England will give his experiences on "Photography with the Flash-light."

* * * *

A CORRESPONDENT wrote us a few days since on the 400 ready promises made by amateurs, and the very tardy

fulfilment of such promises. When photographing, especially in rural districts, the amateur often places himself under an obligation to a villager or inhabitant, and wipes off the obligation most satisfactorily by the *promise* of a print, giving much pleasure to the patient model; but, unfortunately, the promise is too often broken, and at last faith in amateur photographers' promises is lost, the model stoops to the level of being hired, loses the little interest he ever felt, and is more difficult than ever to deal with. Worse still, he looks upon the whole *genus* with camera suspiciously. Many have been guilty of this breaking of promises; we hope these few words prompted by our correspondent will have a salutary effect. We understand "a gay deceiver" of considerable repute sowed promises broadcast in the villages by the Kennett and Avon Canal.

* * * *

THIS week we are able to add to our "Register of Dark-Rooms" more than one hundred, and are quite hopeful that we shall go on increasing until we have a room in every seaside town or touring resort. We shall be very pleased if our subscribers residing in towns where, at present, we have no "dark-room," will allow us to include theirs in our list. Every care is taken in introducing ladies and gentlemen, with generally excellent results. The complaints that reached us last year were very few; chiefly they had reference to untidiness, and the fact of leaving dishes with dirty developers. Our subscribers are under great obligations to those who give free use of their "dark-room," and even where a charge is made it is unpardonable to go away without washing out dishes, measures, etc. This year we have sent a form asking dealers and professionals to state their charge, if any, for changing, developing, etc. In every case this information, and a great deal more, will be given in letters of introduction. Should the charges not be adhered to, we would like to be advised.

In our letter of introduction we shall in many cases be able to secure the use of dark-room belonging to an *amateur*, *professional* or *dealer*, a *photographic society*, or at an *hotel*. The information given and the clerical labour entailed is very considerable, and we have fixed our fee for each town at *sixpence*. Our "dark-rooms" will not be limited to the United Kingdom. We have already secured several on the Continent, and hope to have a room at all the principal holiday resorts. In no case is a town entered in our list unless we have the signed permission of the owner of the dark-room in such town. Our thanks are due to our many subscribers, the Secretary of the Cyclists' Touring Club, and the Britannia Works Company, for the help they have rendered us.

* * * *

WE have received a copy of the rules of the Bilbao Amateur Photographic Society, and are pleased to find that the Society has a considerable number of members, mostly Englishmen. Excursions are arranged from the end of March to the end of September, and in the winter demonstrations are given and papers read.

* * * *

THE fifth annual meeting of the Photographic Convention of the United Kingdom will be held at Chester. The meeting will be opened with a *conversazione* on the 23rd of June, and continue until the 28th. During the week papers will be read, and an exhibition of photographic

apparatus will be held. Excursions to various places of interest will be arranged. The President for the year is Mr. C. H. Bothamley, F.I.C., F.C.S. Further particulars will be announced. There is every reason to anticipate a most successful meeting.

* * * *

THE *Daily Graphic*, writing upon "State Photographers," says:—

"Is photography to play an important part in the making of history? The early story of the world is written in crude pictures, and now that photographs can be made as permanent as the paper they are printed on, there are many reasons why we should revert, with some obvious improvements, to the ancient methods of the Egyptian historians. In 1888, at a conference of photographers, Mr. W. Jerome Harrison, F.G.S., proposed that State photographers should be appointed, whose duty it should be to keep a pictorial record of men and things; and in a little pamphlet recently published is repeated the suggestion, which, by the way, met with the unqualified authority of so great a photographic authority as Captain Abney. There is something very fascinating in Mr. Harrison's idea. Men and cities pass away, and the face of the country is ever changing. Columns of written description only give us a faint idea of the appearance of things in days gone by. We can increase our knowledge of the past but little, but the time will come when the present era will be history, and authentic photographic records would then be invaluable."

* * * *

WE are pleased to hear that a Camera Club has been started in connection with the Toynbee Hall, Commercial Street, Whitechapel. The membership is confined to Toynbee students. Meetings are held on Tuesday evenings.

* * * *

PHOTOGRAPHY, it will be seen, pervades every class of society, and in whatever rank of life it is met with, it is certain that it advances the study of nature and conduces to an appreciation of the wonderful works around us and in our midst. Photography gives a healthful occupation for the body, has an elevating influence upon the mind, cultivating a love for the beautiful, and a study of the marvels and mysteries of the science of chemistry.

* * * *

THE *Century Magazine* for May contains a most entertaining story entitled "The Romance of Two Cameras," which will doubtless be widely read by amateur photographers. The following rather smart definition of an "amateur" from the lips of a child occurs in the text:—" 'Amateur;' what does that mean, I wonder?" Receiving no reply, he answered his query thus: "Well, I guess it's someone who ain't very mature!" Miss Elizabeth W. Champney, the writer of the story, will, we are sure, be thanked by many of our readers for the haze of fiction which she has thrown around the camera.

SATURDAY, the 10th inst., has been appointed for the private view of the Summer Exhibition (the twenty-first) of the 19th Century Art Society, at the Conduit Street Galleries, and the Exhibition will open to the public on Monday, the 12th inst.

* * * *

MR. F. CROSOER, of 13, Market Place, Faversham, the Hon. Secretary of the Faversham Photographic Society will be pleased to hear from intending members.

THE ROYAL SOCIETY OF PAINTERS IN WATER COLOURS.

LANDSCAPE is again the prevailing feature of this year's exhibition. The Society suffers from its exclusiveness as a close corporation, in so far as its sober-going older members remain tied down to old-fashioned methods and ideas; but it gains in not admitting strangers to decorate its walls, because by that means the number of exhibits is kept within reasonable limits.

Mr. Goodwin's "Zermat" (No. 10) is one of the most charming of that artist's landscape sketches, and would make a most satisfactory photograph. Mr. Callow has a number of pretty "bits" from old-world towns of Germany and Italy. He has a knack of reconstructing the mediæval picturesqueness of streets and houses, out of all that modern improvements (!) have left for him to work from, but he certainly does not render his subjects as they are: all truthfulness is lost by the demands he makes upon his imagination, and by the finicking style of his painting, which leads him to elaborate with unnecessary care every unessential detail till the broad truths of Nature's beauty are all but lost amid the enumeration of trivialities. For a different reason, the work of Miss Clara Montalba seems to a photographer little short of grotesque. Her mannerism causes this artist to adopt an identical treatment for the scenery of England, of Holland, and of Italy, and, forgetting the infinitely different and distinct beauties with which a bountiful nature has blessed both north and south, she treats both with a dull uniformity until there is nothing left to admire in her work but the mere technique.

Taking the other extreme, let us look for a moment at Mr. R. W. Allan's pictures—No. 165, for instance. He succeeds in catching the broad effects of nature, and to that extent produces satisfactory work, and with his composition and his rendering of light and shade we have no cause to grumble, but why does he lay his colour on in harsh patches, and spoil an effect which a little more pains and elaboration would have served to perfect? No. 167 is, perhaps, his most successful effort.

Those artists who, being prompted neither by narrow-minded prejudice nor by jealousy, are ready to recognise photography as a handmaid to art, acknowledge gratefully that it has much to teach them, not only with regard to perspective, but also by training the eye to detect with greater accuracy the contrast of light and shade and the relations between the subordinate and the principal objects in composition. Such an artist is Mr. Melville; he has but one picture on view this year, "The North Gate of Bagdad," No. 75, a most interesting and characteristic sketch, the entire truthfulness of which carries with it its own reward. Of other Eastern scenes, notice Mr. Robertson's work, Nos. 33 and 53, with the theatrical element freely rampant and irrepressible.

Mr. David Murray is another artist who goes straight to nature. Nothing could be more excellent than the effect produced in No. 67, "The End of the Flood," to our mind the best picture in the gallery; Nos. 131 and 136, however, are but little inferior. Of the other pictures worth notice Sir John Gilbert's "Autumn" is expressive. Mr. Goddall has a fine interior of a Cairo Mosque, an excellent architectural study. Stacey Mark's "A Rare Copy" is a good figure study, and worthy of this artist's reputation. There are one or two curiosities; for instance, the

portrait entitled "The Worshipful Master," by Carl Haag, where one side of the face is painted in strong sunlight, an effect which we remember was practised by inferior portrait photographers some years ago, but which has happily now gone entirely out of fashion. No. 177 is remarkable because of its excessive vulgarity, and recalls a certain much-exhibited photograph entitled "A Jubilee Joke;" both artist and photographer have much to learn as to the "choice of subject," and might with profit study Ruskin on "Greatness of Style" in painting. Both 69 and 164 betoken weird imagination, but little else. Of sea pieces, Mr. Henry Moore's "Off the Cornish Coast," is immeasurably the best (No. 120); and No. 62, "Bowling Along," is full of motion. There is but little portraiture, and only one picture of real merit, Mr. Henshall's No. 161; but, as we have said, the strength of the exhibition lies in the landscapes, which will well repay the reader's visit.

Letters to the Editor.

WANTED, A PORTABLE AND INEXPENSIVE "DETECTIVE" CAMERA.

SIR,—Will you allow me, through the medium of your influential journal, to draw the attention of the manufacturers of photographic apparatus to what I know to be a real want to many amateurs. Those who travel often feel how much they lose in the way of taking photographs of interesting scenes from not possessing a camera which can be carried easily, and used without attracting universal attention. As far as I know, it is impossible to procure a camera other than toys, which is not most obviously a photographic apparatus. In a recent journey through North Africa I carried a Kodak, as that approaches nearest to a detective of any I know. Its size, however, and evident purpose on close inspection, often prevented it being used without curious observation. Its cost, moreover, is high, and the difficulty of developing its films is a decided objection. Surely among the hundreds of English manufacturers who now waste their ingenuity in devising new shutters and fantastic stands, some might be found practical enough to construct a useful and inexpensive hand-camera. What seems to me to be wanted is a tubular-shaped, strong, metal camera, squared at the base for the dark slide (not the everlasting and awkward rectangular box), 6 by 3 by 3, having a simple shutter that when closed would entirely hide the front aperture. All the usual complicated interior mechanism might with advantage be replaced by an ordinary arrangement for a thin metal double slide, as no man can possibly want to take from 12 to 100 photographs in as many minutes, which appears to be the idea of the manufacturers of the many hand-cameras now in the market. Extra dark slides can always be carried in the pocket. The slide, moreover, by a simple mechanical contrivance should be made to open *inside* the camera without the necessity of any external withdrawal of flaps. The whole should be thickly coated with a good layer of permanent black paint. Now as to cost. It is, I think, quite time that a public protest should be made against the absurd prices asked for cameras, on the ground of the expense of making their lenses. I am glad to see your correspondent, Mr. F. Davis, calls attention to the way the price of lenses keeps up, out of all proportion to the cost of production, and quotes the case of the Kodak (price £5 5s. and £7), the glass of which is stated to be procurable for sixpence! Surely the cost of a fairly good lens for so-called "detective" work can hardly exceed half a crown. The rest of the instrument could be made for something under five shillings. Under these circumstances I feel certain that if some enterprising English firm will be bold enough to step outside the traditional frontiers of the business, and make some such camera as I have specified, and sell it at a reasonable profit—say £1—his reward will be great. The amateur photographer is a long-suffering mortal, and has enriched many; but even he may one day refuse to be further put upon. The English manufacturer may again be too late, as the Americans have no tradition to prejudice *their* trade, and the Germans have always the advan-

tage of cheap labour, and the faculty of appropriating the ideas of others, to compensate for their own lack of originality.—I am, yours faithfully,
F. G. B.
Trieste, April 27th, 1890.

* * * *

ILFORD SCHOLARSHIP.

SIR,—The suggestion made by "Silver Medallist" in your last issue is part of one made in my first letter on the subject. It will, however, be seen that if carried out in part, as he proposes, the competition would not be an *open* one, and, further, the necessary regulations would devolve on ourselves, a position we wish to avoid, as we deprecate all that is "commercial" in connection with the subject.

No, we must wait until one or other of the plans put forward by us can be carried out on its broadest basis by some authoritative body, which consummation we hope will be reached before long.—Yours faithfully,
JOHN HOWSON.
Ilford, May 3rd, 1890.

* * * *

THOMAS'S PLATES.

SIR,—Some time ago, in your "Query" columns, I asked whether the charge for Thomas's plates in Switzerland was not excessive, and I write this letter in the hope that Messrs. Thomas will see their way to cheapen the sale of their plates in Switzerland. The price of Ilford (half-plate ordinary) plates in England is 2s. 3d. (retail), which, reckoning a franc as 9d., makes the price 3 francs. In Geneva you can get them for 3 fr. 20 c., the agent therefore gaining only 20 centimes, *inclusive* of carriage and duty. The price of Thomas's half-plates (T. C. L.) in England is 3s. 6d., which is 4 fr. 60 c. The agent in Lausanne (the only one in Switzerland) asks 6 fr. 50 c., which leaves him a profit of 1 fr. 90 c., inclusive of carriage and duty. I hope Messrs. Thomas will see to this, as it quite prohibits people from using their plates, which I have always done till now. Excuse me taking up so much space of your valuable paper.—Yours, etc.,
H. FERRIER-KERE.
Bex, Suisse.

* * * *

SOCIETY FOR CHISWICK.

SIR,—May I be allowed to take this opportunity of informing your correspondent "G. B." and other photographers residing in the neighbourhood of Chiswick, that the West London Photographic Society, of which I have the honour to be Secretary, is the representative Society of the district, many of the members, including the President and myself, living in Chiswick. The Society since its inauguration has held its meetings at the Addison Hall, W., but the Council, if the sanction of the general body of members can be obtained, are contemplating changing the place of meeting to Hammersmith, which it is thought will be more central and readily accessible from other parts, including Chiswick. I may add that the Society is open to both ladies and gentlemen, and if "G. B." or other enquirers, will communicate with me, I shall be glad to give them every information. Thanking you in anticipation, yours very truly,
JOHN A. HODGES.
May 5th, 1890.

* * * *

PHOTOGRAPHIC EXHIBITION.

SIR,—You will probably be interested to hear, and also probably be good enough to notice in your paper, that the Committee formed for arranging the forthcoming Exhibition of photographs and apparatus at Drapers' Hall, Throgmorton Street, E.C., have held several meetings, and the matter is being pushed energetically forward, a number of applications having been already received for space. The Exhibition, as you probably know, is not of amateur work at all, but confined to professional photographers and photographic apparatus manufacturers, but it will be open free to everybody, so doubtless it will be well patronised by all interested in photography. It is expected to be opened by a *conversazione* on the evening of May 30th by the Lord Mayor, and will then be open daily for about ten days.

The Secretary of the London Chamber of Commerce is affording every assistance possible to ensure the affair being very successful, and from the names already received as exhibitors, it is anticipated that as fine a collection of photographs and apparatus will be shown as has ever been got together.—I am, Sir, yours faithfully,
THOS. P. WATSON
(Member of the Committee of Management.)
May 6th, 1890

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

(Continued from page 290.)

Combining Weights of the Elements.—Consideration of the facts summarised in the laws of chemical combination leads us to suppose that it should be possible to select for each element a number which will represent the proportion by weight in which it will combine with the other elements. By combining these results with certain others which will be considered afterwards, we can, in fact, select such numbers, and they are called the combining weights, or combining proportions of the elements. *The combining weights of the elements are numbers representing the proportions by weight in which they unite together.* An element always enters into combination in the proportion of its combining weight or some simple multiple of it.

Notice carefully that these numbers are *proportions*, and hold good whatever the value of the particular unit of weight used; 1 grm. hydrogen combines with 35.4 grms. of chlorine, 1 oz. of hydrogen combines with 35.4 ozs. of chlorine, 1 ton of hydrogen combines with 1 ton of chlorine. Always the same *proportion* whatever the magnitude of the unit, and it is imperative that the same unit of weight should be used throughout a calculation or series of calculations.

Since the combining numbers are proportions, they must be referred to some standard. Hydrogen is the lightest substance known, and hence is commonly taken as the unit; its combining weight is 1, and the combining weights of the other elements are the proportions by weight which will combine with or displace one part of hydrogen or some simple multiple thereof. Sometimes oxygen is used as the standard; its combining weight is taken as 16, and all the others are referred to it. The numbers obtained in this way are not quite identical with those obtained when hydrogen is the unit; the latter are given in the first column of the table, and the former in the second column. Moreover, if you carefully examine the two sets of numbers, you will see that they have not always quite the same relation to one another. The numbers are the results of experiment, and experiments, however carefully made, are liable to small errors, and some of the differences referred to may be traced to errors of this kind. In several cases the proper values of these numbers are not accurately known. The numbers in the first column are taken from Thorpe's "Dictionary of Applied Chemistry," and those in the second from Ostwald's "Grundriss der Allgemeine Chemie," and they show that chemists have not absolute knowledge even on important points like these.

The CHEMICAL EQUIVALENT of an element is the quantity of it which combines with or displaces one part by weight of hydrogen.

Hydrochloric acid.	Silver chloride.	Potassium chloride.
Hydrogen 1 pt.	Silver 107.7 pts.	Potassium 39.0 pts.
Chlorine 35.4 pts.	Chlorine 35.4 "	Chlorine 35.4 "
Hydrobromic acid.	Silver bromide.	Potassium bromide.
Hydrogen 1 pt.	Silver 107.7 pts.	Potassium 39.0 pts.
Bromine 79.8 pts.	Bromine 79.8 "	Bromine 79.8 "
Water.	Ammonia.	Sulphuretted hydrogen.
Hydrogen 2.0 pts.	Hydrogen 3 pts.	Hydrogen 2 pts.
Oxygen 31.92 "	Nitrogen 14 "	Sulphur 32 "

35.4 is the equivalent of chlorine, 79.8 of bromine, 107.7 of silver, 39.0 of potassium, 7.98 of oxygen, 4.67 of nitrogen, and 16 of sulphur. In a few instances the equivalent and the combining weight are identical, but in most cases the latter is a simple multiple of the former.

Can we explain these facts? Why should the elements always combine in fixed proportions, and why should the higher proportions always be simple multiples of the lowest? At present we have no absolutely certain explanation, but we are able to frame a *theory* which is capable of explaining these facts perfectly, and at the same time is not contrary to any other known facts. In 1803, John Dalton, of Manchester, who was the first to really establish the laws of definite and multiple proportion, endeavoured to explain the facts by reviving an idea which is as old as philosophy itself, namely, the idea that all matter is composed of extremely minute indivisible particles called *atoms*. The idea is now often called *Dalton's atomic theory*, but Dalton was not the originator of the theory; he revived it, and showed how it would explain the known facts of chemistry, and the agreement which was shown to exist between the facts and the theory established the latter on a much firmer basis than it had had before. Since Dalton's time the idea has undergone considerable change and development, and it is now known as the *molecular theory*. It forms an essential part of all modern chemical and physical theories.

Molecules and Atoms.—If we place a small drop of water, or a particle of red mercuric oxide, under a microscope, we can divide them into particles so small that they can only just be seen, but by the help of heat or electricity we can carry the sub-divisions of the particles much further than the eye can follow. We come at last, however, to a point at which our water and mercuric oxide cease to exist as such; they split up respectively into hydrogen and oxygen (experiment 26) and mercury and oxygen (experiment 24). These facts and hundreds of others of the same kind show that there is such a thing as the *smallest possible* particle of a substance, and these smallest possible particles we call *molecules*.

A *MOLECULE* is the *smallest particle of any substance that can exist by itself, in the free state, and yet possess all the properties which distinguish the substance*.

A molecule of water is the smallest particle of water which can exist by itself under any conditions, and yet possess all the properties which distinguish water from anything else. A molecule of mercuric oxide is the smallest particle which can exist by itself, and have all the properties of mercuric oxide. If the molecules are subdivided in any way, they split up into something quite different.

Notice that the definition of molecules includes both elements and compounds.

Molecules are inconceivably minute. Even the most powerful microscope made is quite incapable of showing the separate molecules in a drop of water; we should require an instrument at least as powerful again. Small as they are, they consist of particles still smaller, for a molecule of water splits up into two distinct substances, hydrogen and oxygen, and a molecule of mercuric oxide splits up into mercury and oxygen. The smaller particles of which molecules are composed are termed *atoms*.

An *ATOM* is the *smallest particle of an element which can exist in or make part of a molecule of one of its compounds*.

Notice that this definition includes elements only; it would be incorrect to speak of the atom of a compound. The term "atom" means literally "indivisible," but the chemist is not concerned with the question whether they are absolutely indivisible or not; he simply asserts that they do not become divided in any chemical reactions with which he is acquainted.

We, therefore, look upon all substances as being composed of minute particles or molecules, which consist of still smaller particles or atoms of the elements. In the case of compounds the atoms composing the molecules are of different kinds, but the molecules of an element are of course built up of atoms which are all of the same kind.

Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

ACCESSORY APPLIANCES.

(Continued from page 292.)

The Shutter (continued).—The size of the lens for which it is intended must be taken into consideration when selecting a suitable shutter. Some forms that work in a very satisfactory manner when used on a small lens are utter failures on some of the larger sizes. The greater area to be uncovered and covered taxes the effectiveness of the driving mechanism, frequently necessitating its acceleration of speed to such a point that it ceases to be reliable. Again, by having continually to put the extra strain upon it, the chances of its getting out of order are considerably increased.

Some of the most perfect shutters, as far as the working arrangements are concerned, are made in such a heavy and cumbersome form that for ordinary purposes their use is out of the question. Upon the subject of shutters, however, no positive advice can be given in the way of recommending any particular form, because one without faults has not been invented; all that can be said of a practical value is on the negative side of the matter, by drawing attention to those features which a shutter should not possess. When these points are known, and the reasons that compel them to be entered on the list of drawbacks to a shutter's effectiveness are fully appreciated, then the photographer has been given as much assistance in the work of selecting a good article as is possible. Individuality in requirements and method of working, however, enter so strongly into this feature of photography, that personal experience is the safest guide. A novice in photographic matters is therefore recommended to content himself at first with the cheap and simple article known as the "drop." By its aid he will acquire the experience requisite in making his subsequent selection among the more expensive and complicated articles.

As before remarked, at no point in the movement of the shutter should there be any vibration communicated to the camera. The driving mechanism, which should possess an easy and accurate means of regulating its speed, should not be of a complicated character. In fact, in this as in other matters, the more simple it is, the better in every way. Elastic bands are not recommended for several reasons, the chief one being that they vary in power, do not admit of accurate adjustment, and are not reliable, the weather affecting their elasticity, and under some conditions making them rot. But, on the principle inculcated in the doctrine of choosing the lesser of two evils, the elastic-band method of driving the shutter is far preferable to many of the complicated metal springs now employed in many makes of shutter. The annoyance they can cause can never be fully appreciated, unless one has been a sufferer from this source of photographic adversity. Dampness will cause them to rust, and even with the exercise of every care possible, the springs will break, and, with that immorality which seemingly actuates inanimate things, this breaking will occur at a time when it can be felt as an overwhelming disaster, and its repairment is impossible. Under such circumstances the value of the simple elastic-band method whose derangements are so easily rectified is borne in upon the sufferer's mind in such a forcible manner that any amount of subsequent argument can never completely efface it.

Experience, therefore, dictates the common-sense axiom that elastic bands, even with all their imperfections, should only be discarded in favour of a mechanism of so simple a

character that it can easily be repaired by the purchaser himself on any occasion that it may get out of order. Moreover, it should not work in a manner that the operator is in doubt respecting its performance, or in other words its action should be seen. In some forms of shutter—notably among those that work in the diaphragm slot of the lens—besides there being no visible means of finding out while standing at the back of the camera that the shutter is ready for exposure, there does not exist any sign showing the fact that it has done its work after being released. In some a click more or less audible occurs, but as there are generally several clicks made at different points of their performance, this sign is, even under favourable conditions, somewhat unreliable, a fact learnt from practical experience; again, any noise or a slight attack of deafness destroys the value of this sign and causes anxiety. Another fault in these diaphragm-slot-working shutters is the fact that the metal covering-plate has to be made so thin that any slight accidental bending or even dust from a dusty road will cause it to stick, or not to travel far enough home to keep out all light.*

The best place for a shutter is the front of the camera itself, and doubtless in time cameras will be so constructed as to possess this desirable feature, one which will make the purchasing of a shutter for every make of lens employed quite unnecessary, and so considerably reduce the expense and cumbersomeness of the complete apparatus.

Theoretically speaking, the next best place for the shutter is between the lenses, but this necessitates the employment of such delicate mechanism, and sometimes the cutting of the lens mount, that, as before stated, the increased liability to derangement in this form of shutters practically debars them from being universally recommended.

The worst position of all for the shutter is on the hood of the lens, but, as a matter of fact, it is here that the majority of those shutters which in other respects are most suitable for general work have to be fixed. In selecting a shutter of this character care should be taken that it is made to fit the lens so that it in no way can cut off any rays of light.

A good way to test the efficiency of a shutter, and to gain an idea of the amount of light that it admits to the plate during the various phases of its working, is to have a light placed behind the camera, and to throw an illuminated disc upon a screen or optical lantern sheet. A simpler way is to place the shutter, when possible, upon the lens of a lantern. The disc being enlarged as far as the capacity of the appliances will permit, the working of the shutter can be easily studied, and a fair notion of the speed at which it travels is impressed upon the mind.

Hints about Shutters.—If a shutter is employed that has to be driven by elastic bands, always keep a good reserve of these articles with the lens; they can, in fact, be kept round the lens mount itself. If, on the other hand, a watch spring forms its motive power, learn to take it out and to replace it, and have two or three fresh springs always ready in case of need. As every carrier of a watch knows, these springs are unreliable; one may last for years, and others will break one after another with very little wear and tear and from no recognisable reason. The photographer employing this species of mechanism should, therefore, be prepared for every contingency. The value of oil upon the working apparatus should be learnt, and constantly be borne in

mind. Some small leather rings, fitting accurately one into the other, the larger one being the size of the hood of the shutter, are frequently of great use, for one of them will assist in tightening the shutter's hold on the lens, and occasionally can be employed for adapting the shutter to any smaller sized lenses than the one for which it was intended. Always keep the shutter when not in use in a small box or case, wherein it is secured from accidental injury. Before employing the shutter give it a careful dusting, and see that the piping of the pneumatic release is firmly attached, and is in good working order. Remember the rubber of which it is constructed, if not kept in constant use, is very liable to harden and crack. If this species of deterioration has commenced, no reliance should be placed upon it.

A beginner in the art is also strongly advised to grasp as soon as possible the facts that are necessary for the intelligent employment of the shutter in photography. There is no glory whatever to be derived from taking express trains, and the era when an educated listener can be impressed by the intelligence that a photograph was taken in the 500th of a second, or similarly fabulous statement, has passed away. The knowledge now considered necessary for good work is in the opposite direction. The discovery of the lowest speed of shutter at which moving objects can be photographed without being represented with a blurred outline, and the acquisition of the art of making slow exposures, are attributes conducive to good workmanship with the camera.

(To be continued.)

◀————▶ Rambling Papers.—XII.

By W. K. BURTON.

KEEPING THE SENSITISING BATH UP TO STRENGTH.

WHILST on the subject of silver printing, I wish to say a word or two on the above mentioned subject. There is a good deal of difference of opinion as to what is the best strength of bath to use for sensitising albumenised paper, but all are agreed that to turn out uniform work it is necessary to keep the strength fairly up to some fixed standard. I have tested, volumetrically, the strength of the silver baths of a good many photographers, both professional and amateur, and have almost always found that they are much weaker than the photographer supposed. This arose from the fact that the only test for strength ever made was by the "argentometer." Now, it has been pointed out times out of number that the argentometer, although it may be used to test fairly approximately a newly mixed silver nitrate solution—or, rather, one that has not been used, whether freshly mixed or not—yet it is perfectly useless for testing solutions that have been used for some time, on account of the soluble salts, such as nitrate of ammonium, that are added to them by the decomposition of the salting material of the paper.

It is a very simple thing to make a rough volumetrical test. I have described very fully how it may be done, in my "Practical Guide to Printing Processes," already referred to, but there are many who *will not* take the trouble to make such a test. To these I recommend the following procedure. Do without any estimation at all, but keep a stock solution *twice as strong as the bath that you wish to work with*, and merely make up, after each time of sensitising, whatever loss of bath there is, with this stock solution. If, for example, you wish to work with a 60-grain bath, make up the stock solution to 120 grs. to the ounce.

It is true that there is bound to be some variation by this

* Note.—A fogged batch of plates due to this defect was shown me very lately as the result of a day's photographing, under circumstances of so exceptional a character that this undiscovered fault in the shutter, which was a very expensive one, besides having rendered the results of a considerable expenditure practically *nil*, had caused annoyance of a more than ordinarily exasperating character.

method, and that it would not work at all in the case of very weak baths, but, with the strengths of baths generally now recommended, and the qualities of albumenised paper generally found in the market, it will be found that the variation is much less than when an argentometer is relied on.

RETOUCHING FOR AMATEURS.

I advise every amateur photographer who attempts portraiture at all to learn a little retouching. There are some who say that all, even the slightest amount of retouching is to be condemned. That retouching is carried to such an extent as utterly to destroy the art qualities of the portraits issued by the average professional photographer, is a thing that I am quite willing to admit, although the fault really lies with the public who pay for photographs, and demand that these photographs shall flatter them, rather than with the photographer, who would willingly enough dispense with the trouble and expense of retouching; but it is quite absurd to condemn all kinds of retouching. Such condemnation would be sound only on one of two assumptions—either that an untouched negative gave as absolutely true a representation of the subject as is possible in monochrome, or that, there being departures from this ideally high standard, it was impossible to acquire manipulative dexterity enough to correct them. Now neither of these assumptions is correct. To show the absurdity of the condemnation of *all* retouching, it is best to take an extreme case—not a case that is not likely to occur in actual practice, but one that shows the extreme need of at least *some* retouching.

Probably everyone who has ever attempted to take portraits knows what “incipient freckles” are, knows how that these may be scarcely visible to the eye at all, and yet may come out in a photograph most strongly marked. The fact is, of course, that the difference between the colour of the freckles and of the surrounding skin is slight in the matter of visible colour, but is great in the matter of actinic. It is, in fact, the same case, exactly, as that of the grass mentioned in one of my recent papers, which appeared to the eye to be of a uniform tint, but came out piebald in the photograph. I have one particular case in my mind as I write. I photographed, some time ago, a young girl. She would generally have been described as having a “particularly clear complexion.” I certainly did not, until I had taken the photographs, and knew that they were there, notice any spots on her face at all, but all the negatives came out positively covered with them, and the prints gave the impression of a person who was suffering badly from small-pox! Now who in his senses would say that the pencil should not be used to take out these spots?

It will be urged that this is an extreme case, and that it does not justify the practice of even a *moderate* amount of retouching as a general rule. To this I reply, that in the case I cited the defect is extreme only in degree, and that ninety-nine out of a hundred portrait negatives show faults that are the same or similar in kind, and that differ in degree only from that described. That is to say, almost all portrait negatives show, in an exaggerated form, certain defects that actually do exist, but sometimes to so small an extent as to be unnoticeable, and it is not only *allowable* to remove them, but it is *essential to a realistic result to do so*.

It may be said that these exaggerations would cease were orthochromatic plates used, with a yellow screen or a yellow-glazed studio, such as I suggested in a recent number. Perhaps they would, and when I see portrait negatives produced in practice, that do not show these exaggerations, then will I admit that retouching is a sin. Meantime it is not the general practice to use orthochromatic plates for portraiture.

It is very easy to acquire the manipulative skill to do the amount of retouching that is indicated above. The tempta-

tion, when such has been acquired, is to do more than the justifiable amount of retouching.

It is very difficult to give any instructions that will assist the beginner in learning to retouch. There are several hand-books on the subject that should be studied, but, after all, practice goes a great deal farther than anything else. Let the beginner take some negative that he does not value much, but that shows defects of the kind mentioned, and, taking a print from it, so that he may see the defects both in negative and positive, prepare the varnished surface with some retouching medium, and begin working with a sharp-pointed pencil, to obliterate the defects. He will find it very difficult at first, and the last state of the negative will probably be worse than the first, but if he perseveres, he will find that, after a dozen or two of failures, he is gradually gaining skill, and before very long he will be able to do with ease what appeared quite impossible at first.

It is true that there occasionally occur cases of portrait negatives that it would be simple sacrilege to touch with a pencil, but they are few and far between, I believe, even in the case of those who may in *all cases* select their subjects. It should, of course, be the aspiration of all photographers to get as many such negatives as possible, and the few who practice photography *only* as an art may get a fair number; but how many are there who can do so? The professional photographer certainly cannot, and the amateur must either be much less good-natured than the average amateur is, or else must have far fewer friends than fall to the lot of most of them, unless he finds himself bound, at times, to take the portraits of people whose negatives will be very different from the ideal ones that I have just referred to. And then what a difference if he can produce something that is a fairly favourable likeness—without necessary flattering at all—instead of producing the spotty and blotchy abomination that is the only result of the efforts of so large a number of amateurs! Until some one can show that it is possible to avoid these abominations, or, having got them, to improve them by any means other than that of retouching, I hold that every amateur who intends to take portraits at all, should learn to practice the art to the small extent that I have indicated.

STEREOSCOPIC SLIDES.—Amongst the many readers of the AMATEUR PHOTOGRAPHER there may be some who by frequent examination of their stereoscopes have tired of their slides. Mr. C. J. Curtis, of 6, Tring Villas, Aylesbury, Bucks, would be glad if any such would communicate with him.

PHOTOGRAPHERS' BENEVOLENT ASSOC:—At the adjourned annual general meeting held on Friday, May 2nd, at 181, Aldersgate Street, E.C., the President (Mr. J. Traill Taylor) in the chair, the Chairman, in opening the proceedings, said the business of the evening was the election of officers for the ensuing year. The new rules which had been passed by the meeting held on February 14th had now received the sanction of the Registrar-General of Friendly Societies, and the Association was now, and would in future be, bound by them. The election was then proceeded with, the following gentlemen now constituting the officers of the Association:—President, Mr. J. Traill Taylor; Trustees, Captain W. de W. Abney, C.B., F.R.S., and Mr. W. S. Bird; Treasurer, Mr. John Spiller, F.C.S.; Committee, Messrs. H. D. Atkinson, William Bedford, William Benham, E. Clifton, T. J. Collins, F. W. Cox, T. E. Freshwater, G. T. Harris, A. Mackie, J. D. O'Connor, J. S. Rolfe, and E. A. Whittemore; Auditors, Messrs. W. Holt, E. W. Parfitt, H. J. White, and J. W. Zahnsdorf. The Hon. Solicitor, Mr. William Benham, was also reappointed, and the election of Mr. H. J. Beasley to the post of Hon. Secretary confirmed. The meeting terminated by passing votes of thanks to the various officers for the past year, and to the Hon. Solicitor for his special services. Twelve new subscribers were enrolled. All communications should be addressed to the Hon. Secretary, Mr. H. J. Beasley, 65 and 66, Chancery Lane.

Photo-Zincography.

By W. K. BURTON AND Y. ISAWA.

At a recent meeting of the members of the Photographic Society of Japan, a demonstration was given on "Photo-Zincography," a process whereby blocks ready to be put up alongside of type can be photographically produced from any line drawing or sketch. The following is a very brief description of the various steps of the process, when, for example, it is wished to get a block from a photograph. A very light print is taken from the negative on common photographic paper, but is neither toned nor fixed. The outline is gone over with a pen and the best quality of Chinese ink, and as much line shading is put in as may seem desirable, after which the print is put in a bath of a solution of bichloride of mercury. This quickly makes the photograph entirely disappear, the line sketch only remaining. If a photograph is not to be used, the artist sketches directly with black ink on pure white paper. In either case the result is the same, a line sketch that is copied in the camera, the wet process being used by preference. The negative must be reversed, and the reversal is secured either by using a reversing mirror in copying or by stripping the film of the negative from the glass and turning it over. A polished zinc plate is next coated with a mixture of albumen, water, and bi-chromate of either ammonium or potassium and, when dry, is exposed under the negative, a faintly visible image resulting. The plate is then covered with a very thin uniform coating of a greasy ink applied by a roller, and is dipped in water. In a minute or two the ink begins to leave all the plate but those parts representing the lines and, the action being helped by rubbing gently with a piece of cotton wool, there is soon an image in printer's ink on the zinc plate. The plate is dried and a quantity of powdered resin is dusted over it; this sticks to the greasy lines, but not to the rest of the surface, and a slight heating is enough to incorporate it with the ink. There is now a sufficient "resist" to make it possible to etch away some of the metal between the lines, and the plate accordingly goes into a bath of weak nitric acid. There is only one reason why the etching should not be continued till the whole of the necessary relief is got at one operation, and that is that the acid has a tendency to "under-cut" the lines. It is, therefore, necessary to protect the edges as well as the tops of the lines. To effect this protection the plate is taken from the bath after a very little relief has been got, is dried, and is heated just to that point at which powdered resin will stick to the lines, but not to the rest of the plate. The plate is then again powdered with resin and, when the lines have taken all that they will, it is heated enough to melt the resin and make it run down the sides of the lines. The plate then stands an etching in a somewhat stronger bath, and the process is repeated five or ten times, according to the coarseness or fineness of the work.

The lines thus got are firm and solid, but there are generally slight ridges running along the sides of them produced by the different etchings. To get rid of these, the plate is cleansed of all resin, and is inked up with a smooth roller which touches only the tops of the lines. The operation of dusting with resin and heating is once more gone through, and the plate has its last etching or last but one, for it is sometimes advisable to repeat this etching twice—when it is ready to be trimmed and mounted type-high for the printer.

Samples of every stage of the process from the original negative to a block that had been printed in a machine, and prints from them, were shown, and the process of developing the image on the zinc and of etching was demonstrated.

The demonstrators explained that it was claimed that the whole process, from the taking of a photograph to the production of a finished block, could be gone through in two hours in England. They doubted this, but could easily do the work in from six to eight hours. The block really could be produced in two hours from the time of taking the exposed zinc plate from the printing frame. They farther explained that the advantage of the process was that an exact copy of any line subject, no matter how complicated, could be made in a few hours, either of the same size as the original, or smaller, or larger.

Amateur Work contains directions for making a simple camera for taking pinhole photographs, and there are a number of interesting and useful articles on other subjects.

Our Contemporaries at Home and Abroad.

THE *American Amateur Photographer* (Brunswick, Me.) says, "If any of our readers find it necessary to make negatives of the kind technically known as 'black and white,' they will find that the use of a slow plate, the ferrous-oxalate developer, and Wilde's bromo-iodine restrainer will yield unexceptional results even on gelatine plates. The restrainer is made as follows:—

(1) Iodine	..	..	..	..	15 grs.
Alcohol	..	..	..	..	2 ozs.
(2) Potassium bromide	..	..	..	..	200 grs.
Water	..	..	..	..	2 ozs.

The solutions are mixed and one-half a dram of the mixture is added to each ounce of the developer. The plate must be exposed twice as long as would be necessary in ordinary work, and if the object is to produce negatives for photo-mechanical work the plates should be thinly coated with a slow emulsion and backed with sheets of dead-black paper smeared with glycerine and squeegeed into optical contact. Articles: "A Trip to the Windward Islands, etc.," "Helps in the Studio," "Photo-Micrography," "Pyrotechnical Photography," "Hand-Cameras," "A Panoramic Camera," etc.

The *Photographic Times* (New York) says, "That photography has extended its sphere of usefulness into all the professions and nearly all occupations, is becoming generally known in these days. The camera has been for some time a valued instrument on board the men-of-war of this country and other nations, as well as in the armies of the various governments; but until a letter, dated March 20th of the current year, reached us from Malta, signed by Alfred Davis, 'Sergeant of Photography' of Royal Engineers, we did not know that photography had received official recognition in the manner thus indicated. Sergeant-Photographer Davis is evidently an enterprising worker in our art. He seeks for all the information on the subject that he can get, and keeps up with the literature of the science as best he may. 'Will you kindly forward me, at your earliest convenience,' he writes, 'The American Annual of Photography and Photographic Times Almanac for 1890?' and adds, 'You might put up a catalogue of your publications, if convenient.' We shall be glad to hear from Sergeant-Photographer Davis again." Articles: "Composite Photography," "Exhibition of Photographs at the New York Camera Club," "Platinum Toning," "What Photography will not Do," "Views of Southern Battlefields," etc.

The *Photographic Globe* (New York): "A method for making blue-print positives which we believe to be original with us, and which is easily tried, is recommended, but as not every picture looks well in this monochromatic tint, it is advisable to use such negatives as will yield results not discordant with nature. For instance, it is not artistic to render a portrait or an interior in blue, because it jars upon the eye, the nature of its effect being extravagant. Ice scenes, marine views, and landscapes replete with vegetation look particularly pleasing as blue prints, and as blue positives they are rich and natural. Take good ferro-prussiate paper of thin texture, and make your print very dark, giving it about twice as much exposure to the sunlight as you ordinarily would. The tone of the print can be modified to a purplish blue by adding a few drops of ammonia to water, and floating it for a few moments in it. Care should be taken not to have the solution too strong, as it is liable to bleach the print, and when the desired tone is attained, the print should be taken out and thoroughly washed, in hot water if you like. Wash thoroughly, and lay it between sheets of newspaper under pressure until dry. Float it in a mixture, for ten minutes, of

Benzine	..	..	..	..	20 ozs.
Raw linseed oil	..	..	..	..	8 "

and transfer it to a clean plate of glass the size of the print. Now place another clean glass plate over the surface and subject it to a heavy pressure for about twelve hours. The result will be a translucent positive, which will look as if it were backed with ground-glass. Articles: "The Daguerre Monument," "Manipulation in Flash-Light Photography," "A Tropical Tramp of the Tripod," "Taking Pictures at Night," etc.

The *American Journal of Photography* (Philadelphia), in an article on "Focussing in Landscape Photography," says, "This question of optical definition includes those of focussing and of

the selection of stops of the proper size. Now there has been much arguing whether the extreme distance should be as sharp as the foreground, and the idea has been advanced that inasmuch as the eye sees near objects more distinctly than distant ones, the latter should not be absolutely sharp in the photograph. This we think to be entirely a mistake. In the healthy human eye, everything that is seen at all is focussed upon the retina with an extreme of absolute sharpness, and the involuntary motions of the eyeball are so quick and finely adjusted that any object a little off the centre of sharpest definition, or, in other words, those to which the attention is not directed with full force, are seen just as sharp, owing to the almost lightning-rapidity with which the eye follows the bent of the attention. We may thus safely say that from the theoretical point of view all portions of the photographic landscape ought to be equally sharp, inasmuch as the original in nature is seen by the eye with uniform definition and distinctness. A little practical experience with the camera, however, soon teaches us that absolute optical sharpness is never attainable, and that within certain limits our attempts to approach it are accompanied with the loss of many good qualities in the picture." Articles: "Mechanical Means for Obtaining Increased Brilliancy of Image," "The Search Power of the Camera," "A Remarkable Photographic Robbery," "Palladium Toning," etc.

The *Journal of the Society of Arts* contains a paper read before the Society on the 30th ult., by Mr. T. R. Dallmeyer, on "Photographic Lenses." In the discussion which followed, Mr. Beck said, "With regard to the new glasses from Jena, he might mention some of the difficulties that occurred in using them. Their great feature was that certain of them had very high refraction to very low dispersion, and, therefore, a pair of cemented lenses could be obtained which would more nearly approach to a concentric lens, or would more nearly refract the oblique pencil in the same manner as the central ones. He believed a patent had been taken out for such a lens, but whether it would hold good was another question, because these glasses could only be made achromatic by using them in the patented manner. The great difficulty at present was that, with the glasses as now made, the lenses had to be made so nearly of the same focus that there was great difficulty in making them commercially, and the glasses most useful for this particular purpose would not stand the action of the air. At the same time, an enormous field had been opened up by the introduction of these glasses, and the calculations were extremely laborious. There were as many as 1,900 different kinds, all of which had to be thoroughly worked out before it could be said that no further improvements could be made. Slight improvements had been made in photographic lenses since their introduction, but whether the principle of curing astigmatism could be carried to as great an extent as some were sanguine enough to hope, would depend very largely on whether the manufacturers could carry their experiments a little further, and produce glass rather more extreme still."

The *Practical Photographer* contains articles on "Photography as a Business," "Celluloid and other Films," "The Electric Tachyscope," "A Photographic Survey," "A German Studio," etc.; and also process reproductions of "Before the Bath" and "After the Bath," by Mr. Bhedwar, of Bombay, who exhibited two enlargements of them on opal at the Crystal Palace.

The *Photographer* contains articles on "Dry-Plate Photography," "Out of the Past," "The Practical Printer," etc.

The *Photographic Art Journal* says, "None but those who have tried know the delightful comfort and ease with which development and various dark-room operations may be performed when the lamp is screened with 'canary medium,' under which name the yellow or orange bookbinder's cloth is sold by all dealers. Abolish the red glass and substitute a couple of thicknesses of yellow cloth stretched on a frame, and another frame of similar cloth of a red colour; with this we shall have an absolutely safe light for even the most prolonged development, and for all ordinary purposes the red cloth may be omitted. The negative may be watched without any straining to the eyes, and the progress of development be watched to a nicety. Some lanterns there are in the market which are provided with the desirable canary cloth, but the wonder is that the old-fashioned ruby glass has not been entirely discarded, as it deserves to be, except, indeed, by the users of Isochromatic plates." Articles: "Photographic Figures in Motion," "Three Important Pictures," "The

Choice of a Camera," "The Authority of Painters," "The Art of Drawing and Photography," "Aluminium for Photographers," etc.

Lippincott's for May contains a story, "A Sappho of Green Springs," by Bret Harte, which is of considerable interest, and rather different to the ordinary run of short novels. "Karma" is a curious psychological study, and there is a short story by F. M. Livingston. The other articles are up to the mark.

The *Scientific American* (New York) says that at a recent meeting of the Washington Chemical Society, Dr. T. Taylor, of the U.S. Department of Agriculture, exhibited a new flash light. It consists mainly of charcoal, from the silky down of the milk weed, which is free from ash. A few grains of this new composition placed on paper, and lighted with a quick match, produced a prompt and blinding flash, and will not even scorch the paper. Dr. Taylor says the powder will not explode, either by concussion or friction.

The *Deutsche Photographen Zeitung* (Vienna) contains a fine process reproduction of a genre picture, by G. Brokesch, of Leipsig, called "The Pilgrim."

The *Naturalist's Record* contains articles on "North American Birds, Nests, and Eggs," "Falmouth" (illustrated), "Some Notes on Migration," "Photography," "The Stonyhurst Observatory," etc.

The *Camera* writes on "The Photographic Section of the London Chamber of Commerce," "Lantern Slides," "Photographic Appliances," "Some Educational Aspects of Photography," "Aristotype Paper," "The Optical Lantern," etc.

Science Notes.

THE author (W. M. Rossetti) of an article on "Portraits of Robert Browning," in the *Magazine of Art* for May, writes, "I come next to the photograph by Mrs. Cameron, executed (as I infer by internal evidence) towards 1870. His hair, one sees, was still plenteous and picturesque in growth. The face here looks somewhat broader than in most of the portraits—it assimilates in this respect to the painting by Gordigiani. The features generally tell out to advantage; but the mouth—the little one sees of it amid moustaches and beard—notifies nothing particular in the way of character. As the eyes are well exhibited, I may take the present occasion for observing that our poet had this peculiarity in vision—that with one eye he was long-sighted, and with the other short-sighted. He mentioned the fact to me himself; and I have in some few instances seen him use one eye without the concurrence (which would, in fact, have been the counteraction) of the other, for the purpose of inspecting some particular object at a given distance."

Another photograph of the great poet, taken in 1887, "shows Browning and Milsand (a French friend) standing before an oil picture set on an easel; the former leans his left hand on the shoulder of the latter. . . . The face is serious and observant in profile, the forehead coming noticeably tall; the attitude, though aiming at ease, betrays that consciousness of posing for a photograph which it is so difficult to avoid when sitters are grouped."

To a photographer, certainly the most interesting parts of Mr. Lewis Hind's article on "Painters' Studios," in this month's *Art Journal*, are the admirable reproductions of Mr. R. W. Robinson's photographs. Mr. G. F. Watts is shown in his studio, hard at work at a gigantic horse; the other portraits—of Briton Riviere, J. E. Hodgson, and Frank Dicksee—are capital specimens of "home portraiture." The article has evidently been written to the photographers.

In the prospectus of the Liverpool, 1891, Exhibition, we note that the three classes for hand-camera work are confined to "5 by 4 in. and under;" and the instantaneous class is restricted to "half-plate and under." But why these restrictions? The larger the size of this class of picture, the greater the difficulty. If the restriction had been to "direct work only," it would have been comprehensible; but we don't see why the man who chooses to face and to overcome the immense difficulties of instantaneous work on, say, whole-plates, is to be debarred from competition.

In the Society Competition at the same Exhibition, each Society is limited to twenty pictures (too small a number—forty

would have been better), but nothing is said as to how many of these are to be the work of one man. Thus a Society may be represented by two or three of its crack workers, and quite a false impression of the *average work* of its members may be given. It would have been better to have required each picture to have been the work of a different member.

The practice of our best workers has, of late years, been steadily in the direction of the use of large stops; with a proportionate reduction in the times of exposure, of course. We find that for quarter-plate work a stop of $f/11$; for half-plates, $f/16$; and for whole-plates, $f/22$, are the most desirable. These give breadth and atmosphere combined with sufficient detail. On general landscape subjects in fine weather, and with the "extra rapid" plates of most makers, we find that exposures of one-twelfth, one-sixth, and one-quarter of a second respectively, give well-exposed pictures during the summer months.

We note in the correspondence columns last week that a "Silver Medallist" makes the identical proposition to the Ilford Company, *re* their proposed £100 Scholarship, that we made some weeks back in "Science Notes." It is surprising that so few photographers know of the existence of the annual examination in photography held by Capt. Abney for the City and Guilds Institute. Medals are given, and one would think that the "pot-hunters"—whose work we see at every exhibition—would eagerly avail themselves of this opportunity of testing their knowledge. But they fight very shy of it.

Notes from the Liverpool Centre.

(By our District Editor.)

THE spell of fine weather has been fully utilised, North, by photographers. I hear of several excursion parties in connection with societies in this centre, which were highly successful both in regard to numbers and studies. Last Saturday over thirty members of the Liverpool Association drove to Burton from Birkenhead, between twenty and thirty miles of the most picturesque part of Cheshire being covered. The route lay through Prenton, Storeton, Brimstage, Barnston, etc., returning through Neston and Thornton Hough. The round journey occupied five and a-half hours; between 160 and 170 exposures were made. The results all round have proved eminently satisfactory. It is worth while emphasising the fact that the usual "excursioning" by train was departed from, the party driving in two waggons, the larger of which was drawn by four spanking grey horses. Needless to say that the spin through the country not only added to the enjoyment of the "out," but was of great advantage to those operators who had heavy apparatus. The Vice-President of the Association traversed the ground the day before the excursion, and selected the choice bits of country. Mr. J. L. Mackrell secured a capital plate of the "oldest inhabitant" of Burton, a lady whose patriarchal associations with the village has brought her into prominence as an artists' model.

The fortnightly practical demonstration for new members and beginners in photography was held on Wednesday, the 30th ult. In the unavoidable absence of Mr. J. Macdonald Bell, who was to have demonstrated with "Gelatin-Chloride of Silver Emulsion Paper, Obernetter and Aristotype," the Hon. Secretary, Mr. E. M. Tunstall, filled his place at very short notice, he being a worker of these papers. Mr. Tunstall began by defending the paper from the ridicule with which some of the platinotype workers regard it by comparing it to sugar-plum-box covering. He stated the paper was valuable on account of the beautiful prints so full of detail that can be secured with it, also that by its aid many a valuable glass negative lost or accidentally destroyed could be reproduced in the following manner: by, immediately the said negative is developed and ready, making a rough print with the paper, toning, fixing, and drying it, and putting it away in a portfolio for future use if necessary. In the event of the negative being broken, scratched, or spoiled, the print could then be damped, squeezed on glass, a high gloss obtained, then fixed up on a board and copied from with a camera, and an enlargement made from the negative to the size required. A number of valuable hints and suggestions were made by the demonstrator, acquired in the course of his experience in the working of Obernetter paper. After several prints from whole-plate negatives had been toned and fixed, the process of obtaining the high gloss was gone through, and some prints

which had been previously dried on plate glass and backed with stout paper were successfully stripped from the glass and handed round. A number of very fine prints, mounted in frames, were exhibited, the work of Mr. J. L. Mackrell, an experienced worker of this paper, and one of the first to introduce it into Liverpool.

The Formby Camera Club.—Mr. S. R. Hunt and Mr. R. E. Maclean have been unanimously re-elected Secretary and President respectively. The membership of this society, as I pointed out a week or two ago, is small, but as photography seems rapidly coming to the front in the neighbourhood, recruits are expected. An outdoor afternoon has been arranged for Saturday, 10th inst., the venue being Eastham and Rahmery. This excursion will be the first of a series for the summer months. Mr. Hunt and Mr. Maclean are very energetic, and will no doubt pull the Formby Camera Club together. Both are proficient photographers.

The Birkenhead Association.—While the AMATEUR PHOTOGRAPHER is going through the press the members are busy with their ordinary meeting. Two papers, "Daylight and its Variations," by Mr. Henry E. Burn, and "The Most Effective Means of Preventing Light getting to the Sensitive Plate whilst it is in Course of Development," by Mr. J. A. Forrest, are to be read. Mr. Wm. Faltin will exhibit Anschütz's patent tripod for hand-cameras. The details of the annual outdoor competition, which takes place on the 31st of May, are announced. A silver medal is to be given for the best set of six pictures, irrespective of size.

The Wallasey Photographic Association holds its general meeting to-night (Wednesday), the business including demonstrations on "Bromide Paper," by Mr. James Gill, and on "Fitch's Films," by Mr. H. B. Sharp. The second outdoor meeting of the society this season will be held next Saturday at Eastham, visiting the Manchester Ship Canal Works, and working from this point towards Ellesmere Port. Thus the Wallasey operators are likely to meet their brethren from Formby, both parties being on the same kind of "jaunt" at the same time.

The Walton Society is going fairly strong and well. Since last March, the beginning of the Society's year, several new members have been enrolled, and thus two or three enforced resignations have been more than covered. On Wednesday the second meeting of the present session was held, the proceedings being largely devoted to experiments in photo-zincography. Mr. F. Vaughan again officiated. In Mr. Henry E. Burn, President, and Mr. J. Kennedy, Hon. Secretary, the members of the Walton Society have two able gentlemen, both practical photographers, much given to the art-science. At Wednesday's meeting a plan of campaign for the summer was drawn up. The first outdoor meeting for the year will be held probably at Whitsuntide.

As I have had so much to say about outdoor meetings this week, and a great part of the work of many societies is in this direction during the warm months, it may not be inappropriate to refer briefly to a discussion bearing on the advantages and disadvantages of half-day excursions for photographic purposes. Two authorities here hold contrary views in the matter. One is of opinion that such outings are too scratchy and hurried to be of advantage to the true artist, who must have leisure to cast about for the best spots and the best effects. Skimming over country is apt to make operators, particularly the young and inexperienced, slovenly, careless, and indifferent. The other contends that half-day excursions are a good experience. Operators are not likely to be so easily influenced on the wrong side. They are not compelled to take "studies," and common sense is a sufficient safeguard against "scamping" merely to get a picture. Naturally, in this, as in all things, there are two sides to the question.

The Chester Convention continues to attract great attention. The preparations are on an extensive scale, but everything will be in readiness by June.

"ABC OF PHOTOGRAPHY."—The London Stereoscopic Company have issued the 23rd edition of their most useful manual. It is arranged with much judgment, and illustrated throughout. We have no hesitation in saying that both for the beginner and advanced worker it will be found most useful for reference. It is impossible to give details of contents, but every section of the photographic art is fully described and illustrated. Many useful hints are given as to selection of apparatus, material, etc. The book contains nearly 200 pages, and is admirably got up.

Apparatus.

Messrs. PEARSON AND DENHAM, of Leeds, have given us the opportunity of examining one of their new "Circumbra" cameras, which, as will be seen by the annexed illustration, is constructed on an entirely novel plan. The bellows are circular, the join being strongly sewn, and they are securely fastened to the back and front without the use of glue. The combination of metal and wood in the camera is said to make it entirely unaffected by climate, but, unfortunately, that combination makes it rather heavier than we should desire a camera to be which we had to carry far. The back revolves in the circle at the end of the

OPEN.

bellows, and can therefore be used in any position the worker may desire. Another peculiarity about the instrument we are describing is that the dark-slide, instead of sliding into grooves, as is generally the case, drops into the place occupied by the focussing screen, which then closes on the slide and holds it in position; it is evident that there can be no sticking of the double-back, or refusal on its part to slide into position. The extension is $17\frac{1}{2}$ ins., which is at least $1\frac{1}{2}$ in. longer than is usual, and will

CLOSED.

enable the back half of a rapid rectilinear to be used. A small mahogany front to carry the lens slides on to the metal front, so that the removal of the lens for closing the camera is performed in an instant. The price of the half-plate camera, with three dark-slides, which have a most ingenious fastening for the shutter, is £7 10s.

Mr. W. C. HUGHES, of Kingsland, has shown us a specimen of his "Bijou" enlarging lantern, which is one of the best we have seen. The lantern is fitted with a rectangular condenser, $6\frac{1}{2}$ by $4\frac{1}{2}$, and so will take a full half-plate negative, and a carrier is provided for quarter-plate negatives also. There is a 4-wick Pamphrengos lamp, which gives a splendidly clear and bright light. A good front lens is provided, and there are all the necessary movements for accurate focussing. The price is £6 10s.

Messrs. E. and T. UNDERWOOD have brought out a new time and instantaneous shutter, which is an improvement on the Kershaw, though it has the same kind of revolving curtain. It is called the "Instantolux." One of the improvements is that the actuating spring cannot be over-wound and broken. The change from instantaneous to time is made instantly by the simple turning of a piece of wire bent to an angle. A pressure on the rubber ball being given, the shutter opens and remains

open, whether the rubber ball be pressed or loosed, and is only closed by another pressure of the rubber ball being given. The usual action is that the shutter opens on the ball being pressed, and closes on its being loosed again, any leakages or forgetfulness resulting in a premature ending of the exposure. For instantaneous purposes there is a scale and pointer, which enables exposures to be given ranging from the tenth to the seventieth of a second. The price of the shutter to fit a $1\frac{1}{4}$ in. hood is 16s.

Messrs. HOCKIN, WILSON, and Co.'s "Dot" hand-camera is a compact apparatus carrying twelve plates, $3\frac{1}{4}$ by $2\frac{3}{4}$, and has a changing-bag arrangement, a lever raising the exposed plate so that it can be grasped by the worker. The shutter is a most ingenious one, and can be used for either time or instantaneous exposures. The price is 30s.

Messrs. HOCKIN, WILSON, and Co. have also shown us one of their American pattern detective cameras, which is for use with Eastman rollers. It is larger than the "Dot," and can, if desired, be used on a tripod. It is in a wood case with straps for slinging over the shoulder, and a handle for carrying by hand. The lens is a fairly good one, and the shutter can be used for either time or instantaneous exposures. The price is £2 10s.

Mr. W. TYLAR, whose name is so well known in connection with the introduction of many ingenious pieces of apparatus useful to the photographer, has sent us a specimen of his new focussing chamber, the object of which is to do away with the necessity for using a cloth. The chamber is attached to the frame of the focussing screen by four small screws in such a way that it can be removed without taking out the screws. It is made of stout millboard covered with leather, and will fold quite flat so that it will go into a box less than half an inch deep. It is likely to be largely used by amateurs. The price of a half-

plate chamber is 5s. 6d., and of a quarter-plate 3s. 6d. We have also received from Messrs. Mawson and Swan, Mr. Tylar's London agents, a specimen of his "Lanternscope," an ingenious apparatus to enable lantern-slides to be viewed and judged without the use of the lantern. It will probably be found very useful for the purposes mentioned.

Messrs. GEORGE HOUGHTON and SON have sent us some specimen prints on the Friese-Greene patent opal cards. They are coated with emulsion, and treated in the same way as bromide paper. The effects produced are good, but there is not, of course, that semi-transparency which is one of the chief attractions of opals.

Mr. JONATHAN FALLOWFIELD, of Lower Marsh, Lambeth, has kindly sent us one of his improved "Facile" hand-cameras. Our opinion of the camera is well known by many hundreds of our subscribers, for there is not a week in the year but we are asked as to its merits. We have no hesitation in saying that the

"Facile" is the simplest and best constructed hand-camera in the market.

We give four illustrations. Fig. 1, a section showing the chambers of unexposed and exposed plates, by which the principle is clearly shown. It will be noticed that the plate, when in position for exposure, is in exact register, and, until the milled

FIG. 1.

head or rack and pinion has been turned, no movement of the plate can possibly take place. Fig. 2 shows the operation of filling with new plates, Fig. 3 taking out exposed plates, and Fig. 4 the front of camera with finder, and showing the action of the shutter.

Mr. Fallowfield has now placed the finder immediately over

FIG. 2.

the lens; the eye in looking into the finder in this position *feels* that the lens acts in unison with it; it is hardly necessary to say that such is the case. The shutter is simplicity itself, but we might mention that, in addition to the shutter, there is a light screen at the back of the lens most useful in time exposures. The shutter has only to be pressed quickly or slowly in order to

FIG. 3.

regulate speed; the segment of metal is so cut and hung as to always have a tendency to fall over the lens, and acts admirably.

The lens, when a rapid rectilinear, is fitted with rotating stops, but is of fixed focus, and gives the most excellent definition. We have before us specimen work of very varied character; animals,

street scenes, groups, landscape with clouds, landscape with rushing water, and landscape with figure. In all of these the lens has covered the plate, and every detail is in focus.

Mr. Fallowfield has, after much difficulty, made a new locking sheath, which reduces the labour of filling them with plates to a minimum. The sides of the sheath have no turned-over edge, there being only a turned edge at the bottom, and two ingeniously made clips which catch the plate at the top.

The camera itself is a beautiful piece of cabinet work. This season's camera is somewhat heavier than last year's, but the small addition in weight is fully compensated by the increase in strength and the beautiful appearance. The grooves which contain the plates in each chamber are cut out of solid pear wood, which is very hard, and they are worked to mathematical correctness.

We have said sufficient to endorse our very frequent advice to

FIG. 4.

purchase this camera. Although we have not worked with the cheaper lens, a single aplanatic landscape lens. We have seen very good work turned out by it. Mr. Fallowfield has very kindly sent a Facile hand-camera to the office, and we shall be pleased to allow our subscribers who cannot spare the time to go to Lambeth, to inspect it upon our usual visitors' days.

It is an open secret that very shortly Mr. Fallowfield will open extensive premises in Charing Cross Road, and will then have a large stock of goods specially adapted for the use of amateur photographers.

LEITH PHOT. ASSOC.—The ordinary monthly meeting of this Association was held on the 27th April, the Vice-President (Mr. T. W. Dewar) in the chair. Mr. A. Pitkethly read a paper on "Photographic Apparatus," in which he treated of the camera, lens, and tripod, and pointed out the different and essential features to be noted in the choosing of a photographic outfit. The Secretary exhibited and explained Turnbull's cyclist's detective camera, walking-stick tripod, and film slides and carriers. A copy of "Pictures of East Anglian Life," presented to the Association by the author, Dr. P. H. Emerson, was examined with much interest by the members present.

THE FRENCH EXHIBITION, which is to be opened at Earl's Court this month, will have many attractions, and include a large number of the exhibits at the Paris Exhibition of 1889. The Fine Arts Section will be exceptionally excellent. Among the contributors will be many of the best artists in France, including such names as Gérôme, Bartholi, Barrias, Constant, Armand-Dumaresq, Aublet, Coutan, Yon, etc. etc. Several rooms in the exhibition will be reserved for paintings from this year's two Paris Salons. Amongst other attractions may be mentioned a Norman cider pavilion; the switchback railway, or "Montagnes Russes;" a photographer's pavilion; a shooting gallery; a Parisian café-chantant; a Moorish, Tunisian, and Algerian café-chantant; a diorama of the Paris Exhibition of 1889 and the Eiffel Tower; a French conservatory of orchids; a promenade concert hall; the Edison phonograph, etc., etc.

Register of Dark-Rooms, 1890.

THE following "Dark-Rooms" have been placed at our disposal.

We class them in four divisions, *i.e.*, *a* amateur, *d* dealer or professional, *h* hotels, and *s* photographic societies.

In our letter of introduction full particulars are given as to owner, address, charges (if any); plates, chemicals, etc., kept by dealers; terms for temporary membership of societies; hotels; distance from station, etc., etc.

Every application for letter of introduction must be accompanied by SIX PENNY STAMPS. The owner of "Dark-Room" will be advised by same post as the applicant.

A Model Dry-Plate Works.

In whatever country photography is practised, the "Paget" plate is used and spoken highly of. Last year the Paget Prize Plate Company had the misfortune to have their premises burnt down at Ealing. Like the thorough men of business they are, they at once ceased manufacture, and decided to build a works where they could turn out sufficient plates to meet the enormous demand for "Paget" plates at home and abroad. Rather than disappoint customers, they took no orders, and turned the whole of their attention to the planning and erection of a model factory.

With considerable judgment, they selected Watford as their *pied à terre*, and it was our great good fortune last week to have an opportunity of inspecting the works. They stand upon a large plot, and although at present of an extensive character there remains ample space for future extensions. The works stand well back from the road, and as a consequence are free from the inroads of the dry-plate maker's pest, *dust*. The surrounding country is open and but little built upon, so that in respect of situation the works are admirably placed.

The works have been engineered by Mr. W. J. Wilson and Mr. Whitfield, and, in ingenious application of mechanics to the preparation and manufacture of dry plates, it would be quite impossible to surpass the work done by these two gentlemen. The laboratory is well planned, and in it emulsions and plates are tested, and the many hundred things done necessary in the daily routine of a plate-maker. From this room we pass into a larger room, where the emulsion is prepared and cooked. The cooking is all done in vessels made of the best Minton china, pure white; these vessels are placed in a chamber filled with water, which is brought up to boiling point in eight minutes by steam. The greatest care is of course taken in the making up of the emulsion which has given the "Paget" plate so high a reputation.

In all the operations connected with the making of the emulsion chemically pure water is used. For this purpose many ingenious contrivances are to be found. In the emulsion room distilled water is laid on, and a special steam coil for heating water, in order to be able almost at a moment's notice to have boiling water. It is needless to say that in every particular the works are scrupulously clean.

All water used is softened by Maignen's process, and a very

economical arrangement of distilling water is adopted, the waste steam from the boiler being utilised for the purpose; not a drop of water or a pound of steam is wasted. Whilst speaking of the water supply we may add that soda water, or rather water with soda in solution, is extensively used in cleaning the glass, consequently there is a cistern always full of soda water.

A very ingenious air closet is also arranged, through which hot or cold air can be drawn. This is driven by a Blackman's fan into the drying rooms at such temperature as the season of the year requires.

As in most well regulated dry-plate works, the actual manufacture is carried on upon a general system. The glass is received, and is at once handled by the washers and cleaners, usually an army of girls officered by one or two men, but at the Paget works they have only a few men and boys, and mechanical contrivances do the rest.

We will endeavour to describe the washer and cleaner. The glass is laid upon a bed and caught by two india-rubber rollers, which propel it between two flat brushes working backwards and forwards; two jets of the soda water impinge on the plate, and it passes on through several other rollers, brushes, and jets, and between two squeegees which take off all the soda water; it then goes through more rollers and jets of clean water and on to a bed at the end of the machine, and is rinsed with distilled water put on a rack and placed in a drying closet. To give some idea of the work that may be got through by the machine, we understand that it is possible to pass a hundred dozen per hour through it with an attendance of from six to eight men and boys.

From the drying closet the glass is taken into the coating room, and there coated by a Cadett's machine, a really beautiful piece of mechanism. The emulsion is brought up to a given temperature in a bath heated by steam; it is then fed into a trough made of pure silver, which is also kept at a given temperature by means of a jacketting filled with hot water. The quantity of emulsion allowed to flow out of this trough on to the plates is regulated by a series of beautifully constructed pumps, made also of silver, which can be geared to work quickly or slowly, any number being put into work according to the size of plate to be coated. The pumps lift the emulsion, and it flows over a silver roller, and just the quantity passes from that to the face of the plate.

The coating is most regular. The plates pass over several metal rollers, and are then passed on to a roller covered with linen which is kept constantly wet, by which means the back of the plate is cleaned. From this roller the plate travels upon endless cords to the end of the machine, where it is taken off, placed in racks, and passed into the drying chambers.

In the entering and leaving of all rooms in which plates in course of preparation are being made, most ingenious arrangements have been planned. It is impossible to go from one room to another with the least possibility of daylight entering.

The examining, cutting, and packing is done by girls, the immediate light being ruby, but a yellow light is arranged above the heads of the workers, and the room is really pleasant, although, of course, safely lighted.

We have said enough to show our readers that at Watford the Paget Prize Plate Company have an admirable works. We have no doubt that with the courtesy that the Company's Managers always show to their customers, they will be pleased to admit visitors upon application. It is, of course, impossible in the space at our disposal to give a full account of the many things to be seen and learnt, still we hope the account of our visit may be as interesting to our readers as it was pleasurable and profitable to us.

Societies' Meetings.

NOTE.—In this column the Editor can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editor will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BEDFORD AND DISTRICT CAMERA CLUB.—An ordinary meeting was held on April 30th. An interesting paper was read by the President, Dr. A. H. Beaman, on the "Aptus Glass Etching Plates." The working of the process was fully and ably explained,

the specimen shown being much admired. A discussion followed in which several of the members took part, and the President was asked several questions. On Saturday last, the 3rd inst., an excursion was held to Amptill Park (Lady Amptill having kindly given her consent); good work was done.

BLACKBURN AND DISTRICT PHOT. SOC.—On the 2nd inst. Mr. Orrell showed a series of lantern slides of Australia, with a description of each. A specially fine lot was those of the zigzag railway, which dropped 1,400 ft. down a hill (by a circuitous route seven miles in length). During the evening a specimen of the new Kallitype process was handed round amongst the members.

BRISTOL AND WEST OF ENGLAND AM. PHOT. ASSOC.—The ordinary monthly meeting was held in the Queen's Hotel, Clifton, on Friday, the 11th ult., Mr. H. A. H. Daniel (President) in the chair. There was a moderate attendance of members. Mr. and Mrs. Charles Miller were proposed as members, balloted for, and declared unanimously elected. Mr. E. Brightman then read a paper on the "Carbon Printing Process." A vote of thanks was accorded to Mr. Brightman for his most lucid and interesting demonstrations of the carbon process, which awakened in those present a feeling of new interest in the subject, and surprise that so simple and advantageous a process should have received hitherto so little attention.

CAMBRIDGE (PROPOSED) AM. PHOT. SOC.—A meeting was held on Wednesday evening, April 30th, Mr. F. H. Sanderson in the chair. There was a good attendance. A provisional Committee was appointed to draw up rules, obtain suitable rooms if possible, and to report thereon at an adjourned meeting which was held on Wednesday, the 7th inst., at 8.30 p.m., to appoint officers.

CAMERA CLUB.—On Thursday, May 1st, Captain Abney read a paper on "Pinholes." Mr. T. R. Dallmeyer occupied the chair. Captain Abney, in his lecture, gave the formulæ for arriving at the best size of pinhole for any extension of camera, and explained how it was that by the diminution of the size of the pinhole diffraction phenomena became important, and caused greater blurring than with a larger aperture. Taking light from the most chemically-active part of the spectrum, about G, it was shown that for an extension of 10 inches an aperture of $\frac{1}{10}$ of an inch would give the least diffusion. Also it was further shown that near objects and far objects are differently sharp to a slight degree, according to the size of the hole used. Some actual examples of prints from negatives taken with pinholes of varying sizes were exhibited. That taken with the aperture indicated by theory was the least blurred, one taken with the smallest hole, $\frac{1}{1000}$ of an inch, showed very large amount of blurring. In conclusion, Captain Abney expressed his preference for sharp pictures and photographs, and pointed out that the amount of blurring allowable to give appearance of sharpness to the eye depended upon the distance from which the picture was viewed. In the animated discussion which followed, Messrs. Elder, Clark, Willis, Davison, Clift, Patterson, Rodgers, Wilson Noble, M.P., Humphery, Rev. F. C. Lambert, and the Chairman took part.

CARDIFF AM. PHOT. SOC.—The last meeting of the winter session took place at the Studio on the 30th ult., Mr. S. W. Allen in the chair. The summer excursions were duly arranged, and embrace sixteen fixtures, commencing from the 17th inst. It was decided to ask Mr. Welford to favour the Society with his lecture, "My Experience with a Detective," at an early date. The suggestions of the Camera Club *re* future exhibitions were considered and discussed, and the opinion was expressed that many of the ideas were not practicable. The Honorary Secretary was requested, in acknowledging receipt of the communication, to suggest that the Camera Club should themselves hold an exhibition on the lines indicated, and if the result is financially satisfactory it should be worth the careful consideration of kindred societies. The awards recently gained by Mr. W. H. Kitchin were passed round for inspection. The Belfast Camera Club medal was the twentieth award gained by Mr. Kitchin. Saturday, May 17th, excursion, Aber Valley, first excursion in connection with the County Survey.

CLEVELAND CAMERA CLUB.—At the last meeting of the Redcar and Coatham Photographic Association it was decided to change the name to the "Cleveland Camera Club," and to hold the meetings in Middlesbrough. By the kind permission of the Literary and Philosophical Society, the smoke-room of that in-

stitution has been secured as a meeting-place. A meeting will be held on the 12th inst., for the enrolment of members, etc. All interested in photography in Middlesbrough and district are invited to attend.

DOVER CAMERA CLUB.—On the 29th ult. a photographic demonstration was held by Mr. Smith, of the Eastman Company; Mr. M. Bradley in the chair. A general meeting was announced for Thursday evening, May 8th.

EAST DULWICH AND PECKHAM PHOT. SOC.—The usual meeting was held on the 2nd inst., the President in the chair. The Treasurer gave an account of a visit he recently paid to the Paget Plate Company works at Watford. He said the works were well arranged, and very suitable to the wants of the Company. The Secretary laid on the table Dr. Emerson's work, "Pictures of East Anglian Life," a copy of which the doctor had presented to the Society. The book was examined with much interest, and a cordial vote of thanks was passed to Dr. Emerson for his kindness. The subject of the evening's lecture was "The Optical Lantern, its Construction and Use," on which subject Mr. Banks read a paper. Having brought with him a fine specimen of a triple lantern that had just been made for him by Chatham Pexton, he was able to illustrate his remarks practically. At the close of the paper, the lantern was lighted, and a few slides put through. Seven members were proposed, and the meeting closed in the usual manner.

GLOUCESTERSHIRE PHOT. SOC.—The annual meeting was held on the 28th inst., the President, Mr. W. B. Wood, in the chair. The Honorary Secretary's report was adopted, showing an increase of sixteen members during the year. The President, Vice-President, Treasurer, and Committee of last year were re-elected. Mr. A. H. Clinch was elected Honorary Secretary. The retiring Secretary, Mr. F. H. Burr, and the Rev. Mowbray Trotter were added to the Committee. A hearty vote of thanks was passed to Dr. Emerson for his valuable and useful gift, "Pictures of East Anglian Life." The presentation print for 1890 was selected, the voting being in favour of a 15 by 12 platinum print of a view on the Lynn, by Mr. W. C. Beetham. A lantern outfit, consisting of a pair of mahogany lanterns, with cylinders, regulators, jets, etc., was on view, and it was decided to purchase same for the use of members. The triennial exhibition (open) will be held in October or November, and prospectuses in accord with recently expressed ideas will shortly be issued.

HOLBORN CAMERA CLUB.—The usual weekly meeting was held on Friday, May 2nd. There were twenty members present, under the Chairmanship of Mr. T. O. Dear. Miss L. Hare was elected a member. Mr. Bayston read a paper by Mr. Andrew Pringle, entitled "Points in Albumen Printing." After about half an hour's general conversation on photographic topics, the meeting was brought to a conclusion. This evening (Friday) the President, Mr. T. C. Hepworth, will give a lecture on lantern slides, illustrated by the optical lantern.

LEWISHAM HIGH ROAD CAMERA CLUB.—A meeting was held on the 2nd inst., Mr. Alfred H. Miles in the chair. Mr. R. W. James read a paper entitled "Cameras," illustrated by a large collection of apparatus. The lecture was listened to with interest, and the discussion which followed showed that the members appreciated the subject. Mr. Charles Darling, M.P., Q.C., and Mr. A. Thomas were nominated honorary members of the Club, besides which five members were elected. The next meeting (social) takes place on May 16th, when members will exhibit lantern slides, apparatus, etc.

NEWCASTLE AND NORTHERN COUNTIES PHOT. ASSOC.—At the Central Exchange Art Gallery on the 2nd inst., a lecture was given by Mr. J. P. Gibson, the subject being "Northumberland: its Antiquities and River Scenery." Mr. Gibson, who showed a splendid collection of over 150 lantern slides which he had taken from views, at the outset dealt with the pre-historic races who dwelt in Northumberland, and exhibited a slide illustrative of a hut circle. He proceeded to describe the customs of the people in the early ages, giving a pictorial reproduction of a human skull found in Tarsset Burn. Next he dealt with the period of the Roman occupation, which he followed with views of the present day of the camps of Cilurnum, Housesteads, and Birdoswald. The Saxon age then formed the subject of his lecture, and Mr. Gibson illustrated his discourse with photographs of crosses and other antiquities found in Hexham district. Mediæval antiquities were touched upon, typical castles being shown, such as

Seaton Delaval, Morpeth, Warkworth, Alnwick, Bamburgh, and Etal. Modern topics came next, and the lecturer working westward from Newcastle, found opportunity to afford views of the birthplace of George Stephenson at Wylam and Bewick at Cherry Burn. Bywell Church and Castle, Aydon Castle, and Dilston were also treated upon, a brief sketch of the Derwentwater family being heard with much interest. The scenery of the river Tyne and its tributaries was finally shown, beginning below Hexham, up the North Tyne to Bellingham, and on the shores of the South Tyne to Thirlwall Castle. There was a large audience, and the impression created by the lecturer and his admirable slides was favourable in the extreme. Mr. J. P. Gibson has consented to repeat the above lecture and lantern demonstration to-day (Friday).

ROSSENDALE PHOT. ASSOC.—The members of this Society on the 28th ult. held an exhibition of apparatus, followed by a discussion on the relative merits of the exhibits. Mr. Chadwick occupied the chair in the absence of the President. Dr. Emerson's gift to the Society of "Pictures of East Anglian Life" was on view, and contributed largely to the enjoyable evening, which closed with the usual votes of thanks. It was arranged to hold the first excursion on the 10th of May, when the Society leave Rawtenstall at 1:33 p.m. for Ramsbottom and Summerseat.

SHEFFIELD CAMERA CLUB.—The usual monthly meeting was held on the 25th of April, when a students' night was given. Members were invited to bring down objects of interest to be discussed by those present. A number of plates were developed by several of the members. Two new members were elected.

TUNBRIDGE WELLS AM. PHOT. ASSOC.—The ordinary monthly meeting was held on the 1st inst., the President, Mr. F. G. Smart, in the chair. Mr. Horace Booty and Mr. Lewis Luck were duly elected members. The Hon. Secretary read the correspondence, which included a communication from the Camera Club, as to rules and regulations of photographic exhibitions, but the feeling of the meeting was decidedly in favour of keeping to their own rules; a resolution being unanimously passed to that effect. Several members brought hand-cameras for inspection. Mr. Howard showed Fallowfield's "Facile," the results, being prints from negatives taken by himself, were very good. Mr. Cassingham showed an "Ideal," which was arranged to hold eighteen plates; this worked well. Mr. Cornell brought some lantern slides, the negatives of which had been taken by a "Key" camera, and which showed remarkable sharpness. Mr. Morgan then exhibited his new hand-camera, made by himself, one advantage being that it can be used also as an ordinary camera, the picture being focussed on to a screen at the back, which the peculiar arrangement of the chambers for storing the plates allows. It is very small, measuring 7 ins. high, 7 ins. long, and 4½ ins. wide, and holds twelve quarter-plates. The finder registering exactly with the plate enables the operator to see exactly what he will have on the negative. This attracted considerable attention. A copy of No. 2 of *Sun Artists*, which contained four of Mr. H. P. Robinson's noted pictures, namely, "Dawn and Sunset," "When the Day's Work is Done," "Carolling," and "A Merry Tale," reproduced by the Photogravure process, with a descriptive essay, belonging to the Association, was shown and much admired. One of Zaehndorf's self-binding mounts, and also some of Fitch's ivory films were brought by Mr. Cassingham. Mr. Howard gave members some samples of "Waterloo" plates for trial. The Hon. Secretary read a letter informing him he had been elected corresponding member of the Crawford Camera Club, of New Jersey, U.S.A. The meeting closed with a vote of thanks to the Chairman.

WEST LONDON PHOT. SOC.—On the 25th ult. Mr. Charles Bilton (President) in the chair, Mr. John A. Hodges, the Hon. Secretary, read a paper entitled "Some Practical Hints on the Choice of a Lens."* It was announced that summer excursions would take place on Saturdays, May 3rd, 17th, and 31st, and also on Saturday, June 28th; the next indoor meeting being fixed for July 25th. The annual smoking concert will be held at the Richmond Hotel, Shepherd's Bush Road, on Friday, May 9th, at 8 p.m. Members are entitled to bring one friend.

WOOLWICH AND DISTRICT PHOT. SOC.—A meeting was held on the 30th ult. Fourteen names were enrolled as forming this Society. The Rev. J. W. Horsley was elected President, Mr.

* See PHOTOGRAPHIC SOCIETIES' REPORTER, April 30th, 1890.

R. M. Gilbert Vice-President, Mr. Harris Treasurer; Messrs. Aspinall, Mittelhausen, and Kemp, Council, with power to add to their number. The next meeting will be held on Wednesday the 14th inst., at 8 p.m., to pass the rules and make arrangements for an outdoor meeting. Communications should be addressed to the Hon. Secretary, Mr. Wm. Bacon, 35, Whitworth Road, Shooter's Hill, S.E.

WORCESTER AM: PHOT: SOC.—A meeting of the society was held on the 22nd ult., Mr. Councillor Underwood in the chair. It was resolved to invite Mr. Greswolde Williams, of Henwick Grange, Worcester, to become the President of the society for the current year. Major Webb and Mr. Councillor Underwood were unanimously elected Vice-Presidents of the society. After the election of new members, the meeting proceeded to discuss the arrangement of the summer programme, and about fourteen gentlemen undertook to arrange excursion parties, of which they would act as the leaders. Reports of the different excursions

will be prepared for reading at the winter meetings of the society, and members were requested to make lantern slides of the plates exposed by them during the excursion. The Secretaries were requested to communicate with other photographic societies in the neighbourhood with a view to the arrangement of joint excursions. A proposal to make a photographic survey of the local and historical objects of interest in the city and neighbourhood, for preservation in the local museum, was discussed, and members were requested to supply the society with any of their prints that may be useful for this purpose. The promotion of a system of exchange of work among members met with much approval, and will doubtless be further considered at a future meeting of the society. After the ordinary business had been completed, the members inspected each other's work, apparatus, etc., of which there was an excellent exhibition, and a display of members' lantern slides on the screen by Mr. J. Cam brought a most enjoyable evening to a close.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to **The Editor, "Amateur Photographer,"** 1, Creed Lane, Ludgate Hill, London, E.C.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3776. **Demon**.—Will any amateur give me his practical opinion of the above camera?—**CURIUS**.

3777. **The Camunilux**.—Will somebody kindly tell me if the above is a really serviceable article?—**CURIUS**.

3778. **Dark-Room Gas Lamp**.—I want a really good one; must give plenty of light, and yet be perfectly safe for the most sensitive plates. Which is the best? Any information very welcome, as those I have tried have not been satisfactory.—**M. A. S.**

3779. **Labels**.—What is the best way to preserve photographic labels from the effects of chemicals, etc.?—**S. R.**

3780. **Weymouth**.—I intend to spend my holidays at this place in June, and shall be glad if someone will kindly say what objects of interest there are in the neighbourhood worth photographing, with particulars as to light, etc.—**G. P. W.**

3781. **Tone**.—Will "Q." explain how much water he uses for toning Aristotype with 10 ozs. hypo and 3 grs. chloride of gold? See his answer to 3628 last week. I always tone Aristotype satisfactorily with ordinary borax, and gold bath with other prints.—**STILLINGFLEET**.

3782. **Burnishing**.—Could anyone give me any hints about burnishing ordinary prints? Do they have to be done while they are damp, and what is the best medium (if so called) to use. Any information will oblige.—**DUFFER**.

3783. **Havre**.—Can anyone give me any information about this place? Am I likely to have any difficulty with the custom-house people? What is worth photographing, and how about exposure? Shall go between May 28th and July 28th, stay two or three days, and can only take hand-camera and 40 plates.—**TERWALK**.

3784. **Clark's Platinum Process**.—On page 28 of Mr. Clark's book, "Platinum Toning," a bath of carbonate of soda is recommended for putting the

prints in after toning. Would Mr. Clark, or anyone who has used this process, please say what strength this bath should be?—**S. G. S.**

3785. **Hypo**.—I understand a saturated solution of hypo keeps better than a weaker one. Would some one please say what quantity of hypo there would be in 1 oz. of saturated solution.—**S. G. S.**

3786. **Carbonate of Soda**.—I have seen this recommended to be put in the second washing water before toning for silver prints. Would some reader who does so, please say what quantity per pint of water would be best to use?—**S. G. S.**

3787. **Stirn's Secret Camera**.—Will someone kindly tell me the best way to develop the plates for this? Mine have been a German make, and I can't get a good negative. I also want to know how to cut the prints out, I find it so difficult to get them quite round. Are there printing frames made for these circular plates?—**ENQUIRER**.

3788. **Instantograph Lens**.—Will some reader of the **AMATEUR PHOTOGRAPHER** who has used Lancaster's Instantograph lens tell me which is the shortest exposure it takes in bright sunshine, June 21st, with the largest stop on an Ilford plate ordinary?—**CAMERA**.

3789. **Instantaneous Lens and Shutter**.—Will some friend kindly tell me what would be the best lens and shutter for instantaneous street views, whole-plate size?—**SPEED**.

3790. **Wanstead Park**.—Can any reader inform me if there is any place where plates can be had, and slides charged therewith near to Wanstead Park? I go from Liverpool Street, Great Eastern Railway, and do not wish to carry plates if I can help it; besides, I may want to develop and re-charge same day.—**F. A. E.**

3791. **Toning**.—I use the following formula in toning:

Chloride of gold	1 gr.
Acetate of soda	30 grs.
Water	10 ozs.

But fail to get purple tones, the result being instead a dirty brown. Can any fellow amateur tell me the reason of this, or oblige me with a formula which causes a purple tone?—**EXCELSIOR**.

3792. **Silver Prints Reducing in Toning**.—I use the borax toning formula, as advised by W. A. J. Croke, in the **AMATEUR PHOTOGRAPHER** of 28th of last March, but sometimes I find the prints greatly reduce. Can anyone explain to me the reason?—**G. H.**

3793. **Blue Prints**.—What could I add to ferricyanide of potass. and am. citrae of iron to make the blue prints more sensitised? as now it takes two hours and more in strong sun and good negative to print one, and I wish to do a number in a much smaller time.—**G. H.**

3794. **Hiring**.—Would like to know if in Liverpool I could purchase a quarter-plate camera, etc., on the hire system?—**ANXIOUS**.

3795. **Switzerland**.—I require some hints as regards stops and exposures in the neighbourhood of Lakes Lucerne and Como at this season of the year. My lens is a Beck R.R. (focus 8 $\frac{1}{2}$).—**JOHN E. LANE**.

3796. **Lens**.—Will someone kindly inform me which is the best kind of lens for all-round work, and the focal length of same, whole-plate?—**B. R. J.**

QUERIES UNANSWERED.

Mar. 7th.—Nos. 3528, 3530, 3531, 3551, 3554, 3556, 14th.—No. 3566.

21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3601, 3610, 3612, 3613, 3614.

28th.—Nos. 3620, 3629, 3630, 3633, 3634, 3636, 3637, 3638, 3640, 3641, 3643, 3650, 3653.

April 4th.—Nos. 3661, 3664, 3674, 3677.

11th.—No. 3694.

18th.—Nos. 3703, 3708, 3709, 3711, 3715, 3718.

25th.—Nos. 3727, 3731, 3735, 3736, 3742, 3744, 3747.

May 2nd.—Nos. 3752, 3753, 3754, 3758, 3759, 3770, 3765, 3767, 3772, 3773, 3774, 3776.

ANSWERS.

3748. **Buxton**.—"W. L. F." will find plates and all necessary chemicals at Kershaw's, 47, Spring Gardens. He would also have use of dark-room for a trifling fee. Mr. Kershaw is the inventor of the famous shutter; a most obliging man, always willing to help a stranger.—**D. J.**

3750. **Stand for Hand-Camera**.—Messrs. Fallowfield advertise exactly the article you want at 21s. I had the advertisement the other day, but cannot find it now. I am almost sure it was sold by Fallowfield, but if you get no result after writing to them, I shall be glad to help you further if you will write me.—**W. A. J. CROKE** (address with Editor).

3751. **Stand for Hand-Camera**.—See my answer to No. 3750, in this week's issue.—**W. A. J. CROKE**.

3755. **Retouching**.—It would take too much space to reply fully to Ernie Thompson. He had better buy one of the books on retouching, such as "Retouching Negatives," published by Marion (there is one also, I believe, in the **AMATEUR PHOTOGRAPHER**'s list). The following is, however, a brief outline of the process. Having prepared the negative by one of the retouching mediums sold for the purpose, it is placed on a retouching desk, and over it is placed a piece of brown paper with a hole in it about the size of a sixpence, exposing the part to be retouched, the lines and shades are then softened by means of a Hardmuth or Faber best pencil, Nos. 3 or 4, cut to a needle-point and finished up by means of No. 0 sandpaper; the pencil is used to give lines, dots, or a sort of minute closed spiral, according to the effect desired. If the retouching is unsatisfactory, it may be removed by turpentine. For filling up pin-holes, a soft colour such as Prussian blue is used as follows; rub the cake on a plate, and then damp a fine sable brush with water and draw it to a point, just touch this damp point into the colour, and apply it to the centre of the pin-hole, taking care not to touch the edges—it ought to disappear. Spotting a photograph is done in the same way, using a suitable colour, and either gum, or, better, white of egg.—**J. G. P. VEREKER**.

3755. **Retouching**.—Retouching is a difficult branch of photography. If you want to excel in it, I should advise your taking lessons, or look up the subject in a good book. You will find all the information necessary in "Enamelling and Retouching," by P. Piqueur.—**W. A. J. CROKE**.

3755. **Retouching**.—It is very difficult to acquire this branch of photography; but if you will communicate with me I will gladly lend you a little treatise on the subject. Address with Editor.—**H. ROWLAND**.

3756. **Enlargement Film**.—You can get such a canvas as you require from the Brighton Enlarging Company, 31, West Street, Brighton. The price would, of course, depend on the size required.—**H. ROWLAND**.

3757. **Transparency of Shadows**.—This is the term given to the effect of having details, often semi-concealed or suggested, in the shadows of a picture so as to give the idea that they are simply dark and not solid. The effect can often be given by some bright object against a shadow such as water-fowl, bright blades of grass, etc. It is one of the great powers of oil-painting, as by means of glazes of transparent colours details can be placed actually beneath the surface and yet visible.—**J. G. P. VEREKER**.

3761. **Lens**.—10 $\frac{1}{2}$ in. focus.—No. 1, 1 in. = f/10.375 = 1 sec.; No. 2, $\frac{1}{2}$ in. = f/11.527 = 1.234 secs.; No. 3, $\frac{3}{8}$ in. = f/17.292 = 2.778 secs.; No. 4, $\frac{1}{4}$ in. = f/25.937 = 6.25 secs.; No. 5, $\frac{3}{16}$ in. = f/34.583 = 11.19 secs.; No. 6, $\frac{1}{8}$ in. = f/51.875 = 25 secs. That is to say, if No. 1 stop required, in a certain light, 1 sec. exposure, No. 2 would require 1 $\frac{1}{4}$ secs.; No. 3, 2 $\frac{1}{2}$ secs.; No. 4, $\frac{1}{2}$ secs.; No. 5, 1 $\frac{1}{2}$ secs.; No. 6, 25 secs.—**B. DAVIDSON**.

3761. **Lens**.—The relative exposures are as follows: 1, 1 $\frac{1}{2}$, 3, 6, 11, 25.—**P. K.**

3762. **Sensitometer and Plates**.—There is no method of changing the number of times of plates

into the sensitometer number; at least, I should think not. The following table may be of use to "R. E. S." (taken from Wormald's excellent little book "Practical Index of Photographic Exposure") :—Sens. No. 14 may indicate 3 times rapidity of wet-plate; No. 15, 4 times; No. 16, 5 times; No. 17, 7 times; No. 18, 9 times; No. 19, 12 times; No. 20, 15 times; No. 21, 20 times; No. 22, 26 times; No. 23, 34 times; No. 24, 45 times; No. 25, 60 times.—B. DAVIDSON.

3762. Sensitometer and Plates.—The only way of getting the sensitometer numbers of plates is to expose them in Warnerke's sensitometer, price 15s., the illuminant in this case being a luminous tablet. For private comparison the sensitometer tablet, price 4s., and a standard light can be used.—J. G. P. VEREKER.

3763. Copying.—You will not be able to do this unless your camera racks out at least as much as twice the solar focal distance of your lens. Place the carte de visite which you wish to copy, exactly facing the lens, in some evenly-lighted position, preferably the open-air. Expose much longer than if you were taking a portrait, on account of the focal distance of the lens being temporarily increased.—P. K.

3763. Copying.—Is a very simple matter. Look up back answers to this query; it has been so often asked and answered before in this paper. Use a slow plate and small stop, say $f/32$, giving from five to ten minutes' exposure, but it all depends on the light and the subject.—W. A. J. CROKE.

3764. Plates for Copying.—For copying engravings, use a slow plate giving good contrast, such as Mawson's photo-mechanical, but any plate rich in silver will answer. Print on platinum paper, and the result will be found satisfactory if the illumination is arranged so as not to show the grain of the paper.—J. G. P. VEREKER.

3764. Plates for Copying.—Use the plates you are most used to, as any plates will do for what you want. It is only in case of colours when it is advisable to use isochromatic plates. The best paper to print on for engravings is bromide, developed with iron or hydroquinone; of course, different papers suit different subjects.—W. A. J. CROKE.

3764. Plates for Copying.—See answer to 3763. The collodion process is said to give best results. I have, however, got good results in copying line engravings by using ordinary slow plates, developing with plenty of pyro.—P. K.

3766. Eikonogen.—I cannot understand your not getting sufficient density with the above developer. The fault I have to find with it is that you generally get too much. Perhaps you do not make your developer up properly. I have a simple and good formula, which I shall be glad to give you. If you care to have it, insert another query, as it may be useful to others.—W. A. J. CROKE.

3763. Binding Lantern Plates.—I bind my lantern plates by means of strips of black paper and glue, as recommended by the handbooks, and this process gives every satisfaction.—P. K.

3769. Rydsabounds in pretty spots. Here are a few walks along which "Septimus" will find opportunities to expose several plates: (1) Walk along Esplanade by the sea, past St. Olave to village of Spring Vale, back into Ryde by the park. (2) Along Esplanade, passing Spring Vale, along shore to Sea View, along sands to Priory and St. Helen's Bay, and Brading Haven, thence to Brading, take ferry across, and on to St. Helen's Village, then to Nettlestone Green and Fairy Hill, and cross fields to Spring Vale, and back by road to Ryde. (3) To Bembridge, on to Whitecliff Bay and Culver Cliff, on to Yaverland and by a charming line to Yarmbridge, to the right into Brading, and by high road back to Ryde. (4) Through Play Street and Coppin Hall to Haven Street, on to Brook's Heath, Alderman Mill, and Smallbrooke, on to Sea View, Spring Vale, Ryde. (5) St. John's Park to Whitefield Wood, to the right through wood to Ashy Down. (6) Spencer Road Avenue to Binstead Church, on to ruins of Quarr Abbey. These are but a very few pretty walks. "Septimus" should visit Arreton, Godshill, Blackgang, Bonchurch, Shanklin, Carisbrooke, Cowes, Newport, Alum Bay, Niton, Ventnor, etc. Coaches everywhere.—B. DAVIDSON.

3769. Ryds.—The island is full of lovely and interesting objects to engage an amateur photographer's attention. One of the leading chemists, Mr. Tenison Smith, top of Union Street, has a dark-room for the convenience of amateur photographers.—VECTIS.

3770. Hockin's Camera.—I have had one of Hockin's film cameras in use for some time, and it has given me perfect satisfaction. It carries twenty-four exposures (quarter-plate), and the movement for recording the exposures is very ingenious. The camera is very light and strong, and the workmanship is good.—R. W. S.

3770. Hockin's Camera.—I have just commenced photography with one of Messrs. Hockin, Wilson, and Co.'s "Dot" cameras (30s.), and, considering the price, am much pleased with it.—R. P.

3771. Chiswick.—The nearest society for you that I know of is the West London, which hold their meetings at the Addison Hall. Mr. J. A. Hodges, of 87, Chancery Lane, would doubtless give you all particulars, or, failing him, I, as a member, would help you.—W. A. J. CROKE.

EDITORIAL

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

SAM WELLS.—For all-round work we should recommend lens No. 1.

A. CONSTANT READER.—We do not know the particular lens, but have no doubt that it is an English-made lens with the name engraved on the mount. We have not heard of any maker of lenses in Sydney. Both the other lenses you name are of excellent manufacture. The pictures reproduced are selected from those contributed to our "Home Portraiture" competition.

C. L.—For a cheap set No. 1 is very serviceable. You do not mention a sufficient description for us to say anything about No. 2. No. 3 is certainly no better, if as good as No. 1.

ZINKENITE.—We should recommend No. 2. The firm have an excellent cheap plate in the market. Of very little use.

SNIP.—Very glad you are satisfied with our criticism. Certainly, if you can afford it go in for a lens by a first-class maker; you will never regret it.

MEDICUS.—The following order: E, A, B, F, D, C. We cannot really comment upon all these cameras. In E, A, and B you have three types of hand-camera, and we are quite satisfied that with a good lens, and shutter in perfect order, you can do admirable work with either. E has a fixed focus. A has a focussing arrangement, and we believe B can be had with or without. We think you should, before deciding, see all three.

L. CATOR.—(1) Of the three you name we should place B first, C second, and A third. (2) We have seen some very capital pictures taken with the lens. (3) We should prefer, under most circumstances, plates. Films are, of course, very light and handy when travelling, and in trained hands but some little difficulty is met with.

S. R.—The photographs are evidently the work of a beginner, but show considerable promise. Points of view are in almost every case carefully selected. In 3 and 6 you have too much foreground, in the latter especially you have lost the crown of the trees. In No. 4 you have a good photograph, but you could have done better by being a little closer and avoiding all those pews. In No. 2 you will note that your distance and sky line is quite spoilt, because you have too great an expanse of foreground.

H. L. HUDSON.—We much appreciate your kind remarks, and are delighted to find that you speak in such high terms of our PHOTOGRAPHIC QUARTERLY. The Negative Exchange Club presented so many difficulties that it dropped.

W.—We cannot advise you to part with such a splendid lens; for the one you name they are not really to be compared. You should be able to do almost anything with the R. E. you have.

BLUEBELL.—A: A very excellent, well-made, and handy camera. You cannot buy better plates than B in the market.

JOHN HOWSON.—We shall hope to survive the chastisement, but you know it is our custom in such cases to publish name and address.

E. P. (Ipswich).—We should advise No. 2 with ordinary dark-slides.

T. H. R.—A very charming picture, well posed; the vignetting is rather unnecessary, and the detail in sun bonnet is lost, giving the head and face a flat look. Have you a print from the negative which has not been vignettied? If so, should like to see it.

MISS BEATRICE M. WILSON.—We have your letter, and fear it would be hardly fair to other competitors. We are sending you an entry form.

P. G. HUNT.—We have reported to Mr. O. C. Kirby.

B. BUCK.—The lens No. 2 we should advise. **J. ROSS CORMACK, JUN.**—Many thanks for MS., which will be used in due course.

G.—The matter published is certainly of interest to many hundreds of subscribers in the district. Some points in your letter we have noted, and thank you for the suggestion. It is, of course, impossible to please everyone, but we strive to cater for all, and are sufficiently conceited to believe that our efforts satisfy most of our subscribers. We have not the least doubt that you would be as pleased to have your doings chronicled as are Messrs. Brown, Jones, and Robinson, to whom you so satirically refer.

JOHN E. LOWE.—We have inserted as a query.

ENQUIRER.—If you buy either E, F, or G, you will have a reliable lens. We can thoroughly recommend E for all-round work. The camera you mention is, for a cheap apparatus, very fairly made. With the lens E you should be able to turn out very decent work, and we should be glad to see some of it.

M. U. T.—We certainly think, as price is a consideration, you should buy G. They are thoroughly reliable, and are English made. We have seen beautiful work done with them. We do not think that in the harbour steps negative you could have focussed sharply, or it is possible there was a mist over the lens. The vessel is better. You will, however, we feel sure, be satisfied with the lens we recommend.

S. T. P.—The hand-cameras you ask about we place in the following order: 1, 6, 5, 4, 2, 3. If you require a simple hand-camera, we would say No. 1; if one having several adjustments, movable focus, adjustable shutter, etc., No. 3; if a detective or "hideable" camera, No. 6. These are certainly the best, and have each their good points. We shall be pleased to help you further if need be.

SEPTIMUS.—We are afraid that we cannot recall the photograph, but thank you for the particulars.

E. M. C.—"Ladies' Competition." No photograph that has previously been entered in any of the AMATEUR PHOTOGRAPHER competitions is eligible.

R. W. S.—We will study your letter re hand-camera carefully, and write you. Thank you. We had the ticket; in fact, have all the "Galleries" now. Should be pleased to see you when in town. Monday afternoons or Thursday mornings.

INTERROGATION POINT.—The plates will be safe in the original boxes, especially if packed in trunks with wearing apparel. After exposure, re-pack in the same boxes, and place in your trunk. We should advise either b or d—both most reliable plates. Both makers have a quick plate, and you will do best to use them.

H. G.—A is by far the more compact, but with B you can do course use films. It is an excellent piece of apparatus, and unless you are used to the roll-holders we should advise you to try B.

LAX.—Thank you for your interesting and descriptive letter. Space will not permit us to describe to you how best to make a hand-camera out of a quarter-plate ordinary camera. You may be able to do it, but will find the focussing a difficult matter to get over, if you use sheaths. We are sorry not to be able to advise about shutter. We make it a rule not to mention names in this column. You may send us a list if you like, and we will mention by numbers or initial letter the most suitable for your purpose.

W. FENTON JONES.—Thank you very much. Shall hope to settle the matter in a week or two.

J. WALKER.—Sorry you have abandoned the idea. **CARLSBAD.**—Most certainly A. We prefer this R. R.

JOSEPH CHAMBERLAIN.—Will write you later.

TALIESIN JONES.—You did well not to have the lens from the man. Deal direct, and you will be sure to be properly treated. You will have an excellent lens for your purpose if you buy No. 1. All objects are, we believe, in focus at a distance of 12 ft. and beyond.

F. C. BEACH (New York).—Will write you in a mail or two. Very pleased with your capital letter. Will think about your suggestion.

F. PARKINSON (Cadiz).—Very good of you to help us.

E. H. WALSH (Toronto).—We will carefully study your letter, and before the "fall" will see what can be done in the matter.

J. E. STRANGE.—Thank you; we deal with the subject.

G. A. SAVAGE.—You will note that we have called attention to the matter.

PERPLEXITY.—We have, and will return your MS. No. 4 is the only hand-camera we can thoroughly recommend; but should advise an R. R. lens as most suitable for all-round work. Sorry your question should have been overlooked; also the MS. We are really so full of matter that we cannot use it.

C. T. PARKER.—Your solutions are evidently too strong. With this intensifier great care is needed; the crystals of ferricyanide should be washed by pouring water over them for a few seconds before they are allowed to dissolve. In any case the negative is stained a reddish colour, but when properly manipulated it should not be of so dense a ruby colour as you describe. A bright light gradually decomposes the ferricyanide, therefore the operations made with it should not be conducted where this is possible. The solution rapidly deteriorates when being used, and although it can be kept for a short time, nevertheless reliance should not be placed upon it without subjecting it to tests.

PYRO.—The ferrous-sulphate you are using has been oxidised by exposure to air, hence the rust-coloured precipitate. You should use distilled cold water for making the solution, and then the acid will not be required. If, however, you prefer hot water, the acid should be added before the iron. This will prevent the precipitate, but will not stop the effects of oxidation. As it is, the solution should not be used for developing bromide prints. Use pure water and pure chemicals, and the trouble will disappear.

E. T. H.—Under many circumstances a doublet is to be preferred. The focus of the lens should not be shorter than the length of the plate, but there is

no rule in the matter. The longer the focus of the lens the better for artistic purposes. The portable symmetrical excel in definition and flatness of field. The rapid symmetrical of 1½ in. focus is the one recommended. A sharp picture can be obtained with both at f/11. The sharpness of a lantern slide, made from a reduced negative, ought to be as good, if not better, than one made by contact from a negative of equivalent size.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or two ds, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer."—AMATEUR PHOTOGRAPHER, from Oct. 5th, 1888, till Feb. 7th, 1890, all inclusive; what offers?—Arthur Swan, Eastbrooke, Middlesbrough.

Last two vols. AMATEUR PHOTOGRAPHER, perfect. —P. Kinghorn, 110, Cuthbert Street, Gateshead.

Background.—Cloth background, on rollers, 8 by 5 ft., no seams, never been used much; bargain, 12s. 6d.—39, West Ham Lane, Stratford.

Cameras, etc.—10 by 8 Rouch's new long-focus camera, fitted with all possible improvements, three double dark-slides, and canvas bag for carrying same in, price £8 10s.; half-plate portrait lens (by Rouch), good instrument, price £3 10s.; seen any time by appointment. —Hawkins, Manor Estate, Sidcup, Kent.

Lancaster's whole-plate Instantograph, one wood and three Tylar's double dark-slides, with adapter; 56s.—Carless, Dalton Road, Barrow-in-Furness.

What offers for Lancaster's half-plate International camera, fitted with three Blair's feather-weight slides, new last year, and in splendid condition?—51, Fore Street, Ivybridge.

For sale, Lancaster's quarter-plate Meritoire camera, in thoroughly good condition, with lens, three double dark-slides, and tripod stand; cost two guineas; will take 30s.—F. W. Sears, 1, Creed Lane, Ludgate Hill.

Whole-plate Watson's portable square bellows Tourist camera, cross movements to front, 4 double backs and carriers, R.R. Watson's lens, Watson's shutter, carrying case, perfect order, cost £15 10s., price £9; also several good three and four-fold tripods, cheap.—A. Sprague, 35, Darnley Road, Hackney.

For sale, half-plate mahogany camera (by Meagher), double swing-back, rising front, two double slides, with inner frames for quarter-plates; cost £5; will take 45s. —C. Moreland, 71, Portland Street, Lincoln.

Camera, 10 by 8, rectilinear lens, stand, four double backs, and two cases, latest improvements, nearly new; will sell for £12; cost £25. —H. Lewis, 10, King Street, Egremont.

Camera Case.—Leather case for camera (half-plate) and three slides, good lock, straps, excellent condition; 10s.—Miss Griffith, Littlethorpe, Ripon.

Dark Slides.—New Vergara's 12 by 10 finest polished mahogany dark-slides for films or bromide enlarging; 7s. 6d. each; cost 25s.—Blackmore, Coulter Road, Hammersmith.

Finder.—London Stereoscopic Company's Ready finder; 7s. 6d.—Gordon, 1, Albert Street, Grosvenor Place, S.W.

Hand-Cameras.—Hand-camera, Thomas's Wellington, in black solid leather case, six double backs, two finders, time or instantaneous shutter, focusing lever and screen, can be used on tripod, Wray's 5 by 4 rectilinear lens; cost £12; for £7.—McIntyre, Birkdale, Southport.

Stirn's detective camera, with plates; price £1; excellent condition.—Hewitt, Ryhill, Wakefield.

Rouch's detective camera, covered with leather, most compact reliable instrument, holds 12 plates; price £4 10s.; can be seen any time by appointment. —Hawkins, Manor Estate, Sidcup, Kent.

For sale, quarter-plate Beck's hand-camera, first-rate order, very little used, new; cost £12 12s.; take £6 6s.; including some plates, good reason for selling.—H. Holt, Conservative Club, Liverpool.

Talbot and Eamer's Diamond detective camera, nearly new, sent free for 2s., including three dozen plates, 3½ and 2½; cost 32s.—Cecil Wood, Ilfracombe.

Harmonium.—Folding harmonium, rosewood case, four stops, double set reeds; exchange good camera set, complete.—Laker, Queen Street, Deal.

Lenses.—Ross' 10 by 8 orthographic lens, diaphragms; 73s.—4, Beauchamp Road, Clapham Junction.

Ross' 8 by 5 rapid symmetrical lens, excellent condition, 20s.; also Ross' No. 4 portable symmetrical lens, new, 55s.—Bygrave, 15, Canterbury Road, Brixton, S.W.

For sale, cheap, Optimus rapid rectilinear lens, 7 by 5; price 37s.—Wells, 114, High Street, Kingsland.

Whole-plate portrait lens; will exchange for quarter Lancaster's International camera, or sell 20s.—Jas. Brewster, North Quay, Ayr.

Pair Laverne's rectilinear detective lenses, as Ideal camera, stereo or singly, new; 18s. each.—16, Gladstone Place, Edinburgh.

Lens, quarter portrait, excellent condition; £1; approval.—D. 44, Malvern Hill Road, Birmingham.

Ross' 12 by 10 instantaneous doublet, good as new, for large heads, views, etc.; £4 10s.; particulars.—H. 32, Malvern Road, Beeston Hill, Leeds.

5 by 4 R.R. lens, Iris diaphragm, very rapid, quite new; cost 70s.; will take 45s.—Wallis, Iron Gate, Derby.

Ross' No. 3 c.d.v. portrait lens, good condition; price £5; approval; deposit.—N. Abbotfield, Mannamead, Plymouth.

Lenses, etc.—Lancaster's quarter-plate Silver-rising Rectigraph lens, with Iris diaphragm, and instantaneous shutter between lenses, cost 50s., price 33s.; Vever's half-plate R.R. lens, price 32s., excellent definition, the pair for 80s.—F. Arton, The Green, Darlaston.

Lens and Shutter.—New 9 by 7 Optimus rapid Euryscope, with Volute shutter, perfect, 105s.; 8 by 6½ beautifully painted background on roller, river scene, new, only 10s. 6d.; good tripod, 4s. 6d.; good retouching desk, with drawer, 5s. 6d.—Dalby Smith, St. Thomas Street, Weymouth.

Luggage-Carrier.—Luggage-carrier, suitable for carrying camera on Safety bicycle; 2s. 6d.—Reynolds, Witton, Droitwich.

Microscope.—Microscope (by Johnson), inch and ¼ in. powers, in mahogany lock-up cabinet, with accessories, cost £5; exchange good half-plate R.R. lens and shutter or hand-camera, or sell £3.—A. W. Bullen, Guildford.

Printing Set.—Quarter-plate printing set for sale cheap.—Dry, 48, High Street, Dover.

Sets.—Lancaster's half-plate Instantograph, new, with lens, shutter, stand, and one dark-slide, complete and perfect, for 75s.; International half-plate, also complete and in perfect condition, 85s.; quarter-plate Instantograph, with three extra slides (Delicate's), four in all, for 45s.—J. W. Moore, 7, Market Square, Hanley.

Camera, second-hand Lancaster's Instantograph, with single lens, two double dark-slides, and tripod, all in good order; 35s.—Apply, E. H., 47, Brougham Street, Greenock.

Half-plate bellows camera, 6 double slides, tripod, leather case, W.A. lens, lens with spring shutter, focussing glass, good condition; cost £10; offers.—Masterton, Harris Street, Bradford.

Quarter-plate camera, R.R. lens, and stops, 45s.; or with tripod, 50s.; four double backs are included.—J. E. Hardwich, 13, Sadler Street, Wells, Somerset.

Half-plate camera, slides, and stand, double extension, reversing and swing-back; 25s.—Thomas Dukes, Heath Street, Stourbridge.

Brass-bound quarter-plate camera, leather bellows, rising and falling front, double swing, double extension, four double slides, small finder, and folding stand; £2; complete.—C. Pattison, 137, Isledon Road, Finsbury Park, N.

Lancaster's 1888 Instantograph quarter-plate, in excellent condition, exceptionally good lens; price (with accessories, including tripod, focussing clock, three double backs, and shutter) 32s. 6d.—Further particulars on application to G. T. Nichols, Broadway, Peterborough.

Half-plate camera, leather bellows, all movements, three double backs, four carriers, R.R. lens, Iris diaphragm, complete in case, no better set made, quite new; cost £12; will take £9 10s.—Wallis, Iron Gate, Derby.

Quarter plate studio camera, stand, dark-slide, and portrait lens, also Laverne's quarter-plate rapid rectilinear, perfectly new, price for the lot, 50s.; 5¼ in. genuine Humby bicycle, balls to both wheels, price £8.—Bebbington, Old Trafford, Manchester.

Rouch's half-plate camera, swing-back, moveable front, very light, three double backs, Ross' 8 by 5 rapid symmetrical lens, portable telescopic tripod, Kershaw's instantaneous shutter, waterproof canvas case, all almost new, only used a few times; cost nearly £13; take £3.—Skelton, 3, Wells Walk, Ilkley, Yorks.

Half-plate outfit, extra-special camera, triple extension, three double backs, Optimus rapid rectilinear lens, pneumatic shutter, etc.; cost over ten guineas; sacrifice for seven guineas; in perfect order and equal to new. Also portable dark tent, box form, size when closed, 30½ by 18 by 7½; 20s.—Irwin, 66, Serpentine Avenue, Sandymount, Dublin.

Half-plate Sharp and Hitchmough's Universal camera, three double backs, four-fold tripod, Thornton-Pickard time shutter, latest improvements, 3B Suter lens, absolutely new condition, cost £18 15s., price £12 12s.; Facile detective, cost £3 15s. 6d.; price £2 19s., with Taylor's finder.—6, Montford Place, Kennington.

Watson's 12 by 10 Premier camera, three slides, sliding leg stand, rapid rectilinear, as good as new, cost £23, what offers? Also Wray's wide-angle landscape lens (12 by 10), Kodak, quite new, £3; rapid rectilinear half-plate lens, 30s.; half camera, three double slides, tripod, 30s.; cabinet portrait lens, £1 10s.; Stirn's Secret camera, large size, £1 8s.; Marion's metal camera, with 12 backs in case, £1 2s. 6d. (1¼ in. square); Lancaster's International quarter 330A set, unused, £2 19s.—Robert Pigott Capard, Rosensalis, Queen's County.

Stand, etc.—Quarter-plate folding stand, half-plate metal slide (Tylar's), two vols. AMATEUR PHOTOGRAPHER, two half-plate porcelain developing trays; the lot, 7s., or exchange half-plate tripod stand.—Address, J. Kirkpatrick, Helensburgh, N.B.

Tripod.—Ramsden's patent sliding-leg tripod, collapsible head, 15s.; also three-fold mahogany tripod, 8s. 6d.—309, Liverpool Road, Islington.

Violin.—Will exchange violin, with bow and case complete, for Lancaster's quarter-plate set.—H. Green, Micklegate, Selby.

WANTED.

THE "AMATEUR PHOTOGRAPHER" 1890 TRAVELLING STUDENTSHIPS.

PRIZES.

First Prize	£30 0 0
Second "	£21 0 0
Third "	£14 0 0
Fourth "	Gold Medal.
Fifth "	Silver Medal.
Sixth "	Bronze Medal.

The AMATEUR PHOTOGRAPHER Certificate, duly signed by the Judges, will be presented to the Prize Winners.

PLEASURE CRUISES to the LAND of the MIDNIGHT SUN.—The ORIENT COMPANY'S steamships GARONNE (3,876 tons) and CHIMBORAZO (3,847 tons) will make a series of TRIPS to NORWAY during the season, visiting the finest fjords. The dates of departure from London will be as follows, and from Leith two days later:—

June 4th, for 15 days	July 15th, for 15 days
June 18th, for 27 days	July 23rd, for 27 days
June 25th, for 15 days	Aug. 8th, for 21 days

The steamers will be navigated through the "Inner lead"—i.e., inside the fringe of islands off the coast of Norway—thus securing smooth water; those of the 18th June and 23rd July will proceed to the North Cape, where the sun may be seen above the horizon at midnight. The Garonne and Chimborazo are fitted with electric light, hot and cold baths, etc. Cuisine of the highest order. A

Dark Room provided for the use of Photographers.

[PRICE TWOPENCE.]

✿ OUR VIEWS. ✿

To hold as 'twere the mirror up to nature."—*Shakespeare.*

WITH regard to the proposed Photographic Exhibition in Edinburgh, the *Edinburgh Evening News* of the 8th inst. says, "At the monthly meeting of the Edinburgh Photographic Society last night, it was stated that the Secretary for Scotland had authorised the Board of Manufactures to allow the use of the Royal Scottish Academy's galleries to the Society for the purpose of holding an exhibition of photography and photographic appliances. The exhibition, which, as already stated, will be opened in November next, will continue for about two months. A Committee was appointed to strengthen the Council in organising the exhibition. Arrangements were intimated for a guarantee fund, which it is desired should amount to £600. The society decided to issue medals to successful exhibitors."

* * * *

AN amateur photographic society, the Malta Camera Club, has been formed in the Maltese islands. The club will be of great assistance not only to resident photographers, but also to the numerous visitors that yearly flock to the "Fior-del-Mondo." The head-quarters of the club have been fixed in Valetta. Members will, we understand, have much pleasure in affording visitors any assistance in their power. The Hon. Secretary is Mr. J. H. Cooke, B.Sc., F.R.G.S., Ashfield House, Sliema, Malta.

* * * *

THE popularity of photography is rampant on every side. We are pleased to note that Mr. Andrew Pringle had an opportunity last Saturday of instructing and amusing a large audience of Eton boys in the lecture-room at the College. He dwelt at some length upon military photography and its rapid growth. This part of the lecture was much appreciated by the members of the Volunteer Corps of the College. Mr. Pringle urged upon the "boys" the organisation of a society. The Science master, the Rev. T. C. Porter, M.A., expressed himself ready to receive the names of intending members. We understand that there are no less than one hundred of the "boys" working cameras.

THE Belfast Y.M.C.A. Camera Club have been kind enough to send us their programme for summer outings, and under the same cover they give a preliminary notice of classes, etc., for their Exhibition in April, 1891, which appear to be well arranged.

* * * *

WE publish in another column rather an extraordinary letter from Mr. E. R. Shipton, the Secretary of the Cyclists' Touring Club, in which he calls in question our right to use information contained in the "Cyclists' Touring Club Handbook" for the purposes of securing the use of dark-rooms throughout the United Kingdom, for subscribers to the *AMATEUR PHOTOGRAPHER*. As far as we know, the book and all that is in it is public property. We have made an application to every hotel-keeper named who has a dark-room, and have asked them to place ladies and gentlemen we may introduce upon the same footing as members of the Cyclists' Touring Club. We presumed that the hotel-keepers are free agents, and we have yet to learn that they are not. Many, we are pleased to say, have conceded to our request, and by their so doing three things have been accomplished—(1) We have added additional dark-rooms to our list; (2) we have secured an advantage for our subscribers, and (3) shall hope to increase the business of the hotel-keepers.

* * * *

MR. SHIPTON is not concerned as to whether the matter is a commercial one or not. The club of which he is Secretary is well known to be a commercial undertaking. We must also beg him to allow us to conduct our business in our own way, and he may rest assured that we shall always strive to do the best for the greatest number. We do not raise the point, but believe it is possible that Mr. Shipton may find that the securing of "dark-rooms" for photographers was originated in this journal.

* * * *

As the Ladies' Photographic Competition is likely to result in a large number of photographs being entered, we shall be glad if competitors will send in their work as early

LADIES' COMPETITION.—All photographs must be received by Saturday, May 31st, 1890.

as possible. The last day for sending in is the 31st inst., and it will considerably help us if we receive photographs entered before that date if possible.

* * * *

THIS week we add some forty or fifty more "Dark-rooms" to our register, and, like one Oliver, are still asking for more. It is very desirable that our list should include all seaside and touring resorts. In towns on the Thames between London and Oxford, we shall be glad of the use of "dark-rooms," either belonging to amateurs, dealers, or professionals.

* * * *

IN our note on warm tones we omitted to mention the very beautiful results to be obtained upon Alpha paper. The Britannia Works Company have sent us some really excellent results on matt-surface, especially a large photograph of Tinworth's very beautiful frieze "The Release of Barabbas." We shall hope shortly in one of our publications to give an example of work on Alpha paper.

* * * *

IN another column we publish a very interesting account of the meeting of the members of the Birmingham Photographic Association, at which the plans were discussed and the Committee formed for the carrying out the necessary arrangements for the commencement of the Photographic Survey of the County of Warwick. Alderman Stone, the President of the Association, in his address, gave the members some excellent advice which, if acted upon, cannot fail to help the movement.

* * * *

SOME weeks back we sent a special Commissioner to inspect the automatic photographing machine at the works of Messrs. Salter and Co., at West Bromwich, and, as a whole, our commissioner was able to report most favourably upon the machine, as such. This week we see advertised a company with a capital of £100,000 established for the purpose of purchasing the patent rights and working the machine. The price asked for the patent rights, in our opinion, stamps the Company as a most undesirable concern to place money in. The clause in the prospectus referring to the purchase states, "*The price to be paid for the patent rights for the United Kingdom, together with the benefit of all contracts in connection therewith, and the secret for preparing the chemicals, has been fixed at £60,000, payable as to £300 in founders' shares, £39,700 in cash, and the balance in shares or cash at the option of the Directors; this will leave a working capital of £40,000, which will be ample for the purposes of the Company.*"

Yes, ample, if the British public are foolish enough to subscribe the money. It may or may not be desirable that everyone shall be photographed at his or her sweet will for a penny, but we cannot imagine that the public will be foolish enough to give £60,000 for the rights of an untried machine. The profits upon work to be done with it are at present based upon estimates which have been drawn up by the Company's promoter. The Directors, no doubt, are honourable men, but they are unknown in photographic circles. The only gentleman who has any connection with photography is Mr. Ladislav Nievsky, who is advertised as "Chief Photographer, London Stereoscopic Company, Limited, 106-108, Regent Street, W. (Technical Adviser to the Board)." This statement is hardly in accordance with fact, for we notice that in Tuesday's

Standard Mr. S. Clark, the Company's Secretary, advertises that—

"The name of the London Stereoscopic and Photographic Company (Limited) having been published in the advertisements and prospectuses of the above Company, in connection with an operator who is no longer in their employ, the Directors of the London Stereoscopic and Photographic Company (Limited) desire to announce that neither directly nor indirectly have they or their Company any interest in, or connection with, the Automatic Company."

Although we are always delighted to uphold and support all movements for the advance of photography, we cannot counsel our readers to invest their money in the purchase of the patent rights of a machine that turns out, at best, the inartistic "tin type."

* * * *

WE have again received the excellent programme of rambles of the Manchester Amateur Photographic Society for the summer season. This society may be taken as a model in all matters affecting the organisation of photographic societies.

* * * *

WE are asked to state that the Committee of the East Dulwich and Peckham Photographic Society have decided to continue their meetings on the first and third Fridays in the month throughout the year, instead of as last year suspending the second meeting during the summer months. The excursions will be held as last year. The first, to Carshalton, on Saturday, the 17th. At the meeting on Friday next the subject for discussion is "Apparatus." We strongly uphold the holding of informal meetings during the summer months in addition to the "outings," as by so doing members keep "in touch," and are able to compare notes upon work done.

* * * *

WE feel it our duty to caution subscribers against having dealings with firms offering to supply well-known makers' goods at discounts varying from 10 to 25 per cent. We have taken some trouble to trace these matters, and find that it is the regular practice of certain firms to communicate with advertisers in our "Wanted" column, offering to supply the article required, new, at a large discount, causing, in many cases, much disappointment, as, after entering into correspondence with these firms, it frequently turns out that they cannot supply the article, but strongly recommend their own special lens, camera, etc. Complaints reach us by almost every post, not only from the victims, but from manufacturers and dealers, who assure us that they will not have any dealings with such firms, and could not afford to allow them the discounts which they offer broadcast to retail purchasers. To guard against this annoyance, our publishers will be pleased, for a small fee, which will be stated next week, to receive and send on to advertisers in the sale and exchange columns, replies to their advertisements. Such advertisements will be numbered and the address duly registered.

The Sale and Exchange column was established for our subscribers who have apparatus to dispose of, and who are willing to sell or exchange it for other articles, or for making known their wants and requirements. We jealously guard against trade advertisements being inserted, and would ask our readers to co-operate with us in order that the purposes of this special section of the paper may not be violated.

Letters to the Editor.

YELLOW CALICO V. RUBY GLASS.

SIR,—It is interesting to note how regularly this subject crops up for discussion, and how seldom the ordinary amateur photographer will experiment for himself or herself.

To me it appears that the whole matter lies in a nutshell, viz., one make of plates will fog when exposed to the light filtered through yellow calico, whilst another will not, and it may be taken for granted that a plate which will not fog in a yellow light will not do so when exposed to a ruby light.

By expending one or two plates, every one could test this for himself or herself. Provided that in other respects the dark-room was light-tight, all that has to be done is to load a dark-slide, then draw the shutter half way out, and expose the plate for ten to fifteen minutes to the light, ruby, or yellow, or cathedral green, whichever is fancied. While the exposure is going on, a normal developer should be mixed, and a fixing bath poured out; on the time of the exposure being up, the light must be obliterated, and development and fixation of the plate carried out in darkness. If the plate does not fix out quite clean it may be assumed that the light is unsafe.

In my own experience I have adopted this plan, and feel convinced that I have saved many plates by using a proper and safe light. For instance, I use two brands; one I can develop with impunity in a yellow light, the other fogs at once; and in consequence I use two screens, one yellow and one ruby.—I am, Sir, yours, etc.,

A. R. F. EVERSHED.

May 5th, 1890.

* * * *

MONTHLY COMPETITIONS.—A SOCIETY WANTED.

SIR,—I felt highly honoured at receiving the Silver Medal today for first prize in the "Figure Study" Competition. It is, I may mention, the first medal I have received for my attempts in photography.

I am an amateur of less than two years' standing, and may say that almost the whole of my photographic knowledge has been acquired through the medium of your excellent paper.

Unfortunately, as there is no photographic society in the Crystal Palace district, I do not have opportunity for intercourse with other amateur photographers. You have helped to start a good many photographic societies, and I should be heartily pleased if you could assist in the formation of one in this district.

I shall be glad to hear from anyone interested in forming a photographic society in the Crystal Palace district.—I am, gentlemen, yours faithfully,

G. F. ZIMMER.

May 8th, 1890.

* * * *

MR. BULMER.

SIR,—I hope you will excuse my troubling you on a subject which I think is of importance to amateurs.

A certain photographic dealer named F. D. Bulmer, of Wakefield Road, Dewsbury, appears to carry on business in what looks like a dishonest manner. His *modus operandi* is, as follows:—

One of the members of my boys' club (the Gordon Camera Club) advertised in your sale columns for a quarter-plate Lancaster's Instantograph. He received an answer from this man offering him a new one direct from the makers for £1 14s. 6d., the maker's price being £2 2s. We sent the money, and received a reply asking to be allowed "to send one of our Reliable sets at £2 15s. They are far superior to Lancaster's. You can have one down for a week's trial, and we will pay carriage one way if not approved." This we declined, and asked to have a Lancaster's set sent, or the money to be returned. He then sends a post-card, "Dear Sir,—It will be a week or ten days ere our agents can send you a Lancaster's set. *Shall we send or not?*"

To this we replied that we could not wait that time, and asking for the money to be returned.

On the 1st of May we received a post-card stating the money should be sent on the 3rd. We waited till the 6th, and as it had not come I sent a lawyer's letter for it. The money arrived on the 6th, minus 2s. 6d. which had been deducted for expenses. As all the expenses had been two or three stamps, I wrote, expostu-

lating, when I received the following: "May 8th. Sir,—Replying to your letter, we would say that you took upon yourself the right to cancel order for the set, therefore must bear the expense incurred. Your order was duly filed with our London agents [see words italicised above]; we had to cancel same. We may say that we have upwards of twenty clients waiting for sets. If you can see your way to give us an order, we will allow you the 2s. 6d., otherwise we cannot."

I see from your columns that this man has been engaged in a somewhat similar proceeding with Taylor's lenses. Can you suggest some means of putting a stop to or exposing him? For aught I know, he may be making his living out of the half-crowns he deducts for mythical expenses. I am seriously thinking of suing him.

THE GORDON CAMERA CLUB.

My boys' club is a great success. They are all working lads, and are getting very proficient. I have to thank you for inserting my previous "begging" letter, whereby I got a good number of useful articles. Allow me also to say that my own intense interest in the art for the past three years, and whatever proficiency I may have attained, is due very largely to the constant perusal of your most valuable paper.—Yours faithfully,

May 9th, 1890.

SOLICITOR.

* * * *

DISTRICT EDITORS.

SIR,—I am glad to see that "A President" has thought it worth while to reply to my letter, as apparently he himself is particularly affected by the questions raised.

To take his points seriatim: (1) "A President" says, "A journalist is less likely to grasp salient points or appreciate technicalities." If so, why? seeing that one of your qualifications of a district editor is that he should be a photographer.

(2) "A President" suggests that "there is no valid reason why he should be more impartial than any one else." To this I answer, in most societies cliqueism is sure to exist, more or less, and I contend that the Press man being solely representative of the interest of the journal would be outside any party cliqueism and favouritism. The comparison between "Radical reporters" and "Primrosers" seems to be far-fetched, for it has never been suggested that any one having an altogether antagonistic interest should be eligible as district editor. As regards the inference that a journalist would be more open to bribes, I, at any rate, give him credit for something better; besides, too, his conduct in this respect would be more controllable by his employers than would an irresponsible member.

(3) As to the Press man requiring a greater honorarium, that is not a question for "A President" or myself, but rather for the proprietors, who I do not think would withhold a fair remuneration to a fitting person.

What "A President" urges on the other hand is simply a reiteration of his objections to a Press man, being only the same arguments reversed; however, I will continue to treat them seriatim.

(1) The member, "A President" thinks, would be better acquainted with the subject than a journalist. As I said before, the Press man is to be a photographer, and presumably would know his business.

(2) "A President" says, "A member would not be less fair than a journalist." But being dependent upon his society, and heated in his own arguments used in the discussions, a member must necessarily be less impartial than a journalist, who is only concerned to faithfully represent his employers. As to his reports being "open to the criticism of his fellow members," if they are not more so than now, the advantage would be very slight. And as to "the executive of a society using their influence to ensure his impartiality," they would not be more likely to do so than hitherto, but rather the contrary, especially when they would have such a good opportunity of using their influence for self-glorification. Lastly, as to any unfairness being intimated to you, Mr. Editor. This would not necessarily be resorted to, as the modest but sound members would not care to lodge complaints, and would still continue to have their voices drowned by the more noisy but superficial ones.

(3) "The remuneration that would be required would be nominal." It is open to doubt as to whether it would not be a false economy.

With regard to the observation that "the sense of responsibility in a district editor would be far greater than it is in the case of a

quasi-anonymous reporter," I am at a loss to see the drift of the argument, except that if it means anything it is entirely in favour of the Press man.

This, I think, ends my answers to "A President's" objections and contentions; but as to the last two paragraphs of his letter, it seems to me it is here where the shoe pinched, inasmuch as "A President" evidently feels he cannot with fairness, after my previous letter, constitute himself the alpha and omega of his society.—I am, yours, etc.,

A VICE-PRESIDENT.

* * * *

INEXPENSIVE "DETECTIVE" CAMERA.

SIR,—With regard to a cheap and portable hand-camera, I hold the same opinion as does your correspondent "F. G. B." My attention was first directed to the subject on seeing the Demon camera, which of course in its present state is little better than a toy—at any rate, it proved so in my hands. If my ideas are worth anything, I would suggest to the manufacturers of the above-mentioned camera to make an instrument on the following lines:—Retain the back arrangement, which I think is very simple and compact, but make it large enough to take in a $3\frac{1}{4}$ by $3\frac{1}{4}$ plate. In place of the conical tube on which the lens and shutter are fixed, I would have a telescopic sliding tube arrangement, similar to the front of a lantern, and this to have one or two sliding tubes, so as to enable the camera to shut up to one half the length it would be when fully opened out. As to the lens, I think a fairly good one of about $3\frac{1}{4}$ or $3\frac{1}{2}$ inch focus could be supplied and fitted for about three shillings. As regards the shutter, I think a better one might be devised than that supplied with the Demon. The dimensions of such a camera would be approximately $3\frac{1}{2}$ by $3\frac{3}{4}$ by 2 inches when closed up, and when fully extended would be about 4 ins. from back to front. I am supposing it to be made of block-tin, or something similar, but instead of being nickel-plated, let it have a thick coat of japan, so as to be as unobtrusive as possible. I see no reason why an instrument of the above description could not be turned out for fifteen shillings or thereabouts, and be productive of good work. Such a hand-camera could easily go into the pocket when closed, and when wanted for an exposure could be brought into use at a moment's notice.—Yours, etc.,

T. D.

SIR,—Your correspondent "F. G. B.," writing from Trieste, whose letter was published in issue dated May 9th, has done well in pointing out that there is a great want of a portable hand-camera. Although I cannot believe that lenses, if they are worth using, can be made under the prices at present quoted, yet there seem to be unreasonably high prices quoted for some cameras. It is beside the question to state the glass of a lens is procurable for sixpence. A pound of iron, at a cost of a penny, can be manufactured into watch springs; or the reverse, a copy of the AMATEUR PHOTOGRAPHER can be purchased for twopence, but that is no guide to what it cost in producing. As to cameras, the same argument applies.

Why hand-cameras should be made solid, rigid, and immovable as far as outward appearance is about as questionable as why in time past all cameras should be of the same type or model—a wooden box. There is no earthly reason why they should not be made of the bellows body, to slip in the pocket when not in use. Perhaps a tubular form, like a "telescope," would be as well as any. Any manufacturer who brought out a cheap, reliable, and really portable camera and walking-stick stand would, no doubt, as your correspondent points out, reap his reward. S. E. K.

May 10th, 1890.

* * * *

"KODAKS," AND THE LENSES USED.

SIR,—My attention has been called to a discussion which appears to have been started by a Mr. F. T. Norris, and continued by Mr. Fred. Davis, and another, signing himself "F. G. B.," the basis of the discussion being a statement of the said Norris, that the first cost of the Kodak lens was about 6d. each.

As there are in all eight sizes of the series of hand-cameras known as the Kodak, I must do these gentlemen the justice to assume that they are not yet aware of the existence of more than one, and that the first and smallest of the series; but when Mr. Norris stated as a matter of fact that the lens of the Kodak, or of any of the series of Kodaks, costs only 6d., he went quite

away from the facts, and descended to the plane of pure invention.

The object of the Eastman Company in introducing the smallest, or No. 1, Kodak first should now be obvious to any business man. The entire system of film photography at that time was under the ban of popular prejudice, and this prejudice was encouraged and fostered systematically by a large portion of the dealers in photographic goods.

The No. 1 Kodak appealed to a perfectly new audience, and made its way into a field which had never been dreamt of by anyone in the photographic trade, and it was and is capable of making as good negatives as any hand-camera within the scope for which it was intended.

The people who criticise this little instrument, and they all rush into print, do it of sheer ignorance of the crudest elements of optics, for never was a Kodak sold without a manual of instructions, which calls special attention to the angle of the lens, and the evils which would result from an attempt to use it improperly.

If these critics or any of our readers who have been misled by their statements, really care to know the truth, let them examine a No. 1 Kodak lens, and they will find that it consists of two periscopic lenses. If they care to carry the investigation further, they will find that the larger Kodaks are all fitted with double achromatic combinations, and anyone having the slightest knowledge of practical optics would hardly care to venture the suggestion that it would be possible to produce the same at the price mentioned with so much assurance by Mr. Norris.

Your last correspondent, who shelters himself under the initials "F. G. B.," of Trieste, appears to have a withering contempt for goods of American manufacture, and of the poverty of German ideas.

In this connection, I may here state that the Eastman Company gave carte blanche to two of the most respected and successful makers of photographic objectives in Great Britain to produce a better lens for the No. 1 Kodak, and they both, after experimenting, in the one case for a period of six months, and in the other for nearly one year, reported that this was *impossible to do* unless the focus was increased. Quite so, you cannot keep your cake and eat it also—we knew that long before their decision.

As to German scientific knowledge and manipulative skill, no higher compliment need be given than the fact that the most scientific men at present hardly consider their education complete until they have taken either degrees at some German University, or are sufficiently well versed in the German language to read intelligently the scientific and technical productions of this race, which is now admittedly the most scientific and systematic of the age.—Yours truly,

WILLIAM H. WALKER.

* * * *

LIGHT IN THE DARK-ROOM.

SIR,—There appears to be considerable difference of opinion as to the quantity and quality of light which may be safely admitted to the dark-room during the operation of fixing negatives and prints with hypo-sulphite of soda.

Some advocate the same intensity of ruby or orange that would be employed towards the latter end of development. Others again hold that such precaution is quite unnecessary, and advise working by candle, lamp, or even diffused daylight.

It is to the latter especially that I would offer a word of warning; a warning by no means unneeded in these days of "photographic surveys," where permanency is the first desideratum.

Take, for example, the fixing of a gelatine bromide plate in hypo; we have:

This, of course, is as it should be; the AgNaS_2O_3 , being freely soluble in water, is easily eliminated by the usual process of washing; but allow actinic light to reach the solution during fixation, and we at once have a highly insoluble double hyposulphate of silver and sodium formed, the equation being:

It is hardly necessary for me to comment on the danger in-

curred where the formation of this insoluble compound is permitted.

The above equations are equally applicable to the other salts of silver, as AgCl , AgNO_3 , etc.

Should the pseudo successful worker by actinic light feel disposed to question the necessity of fixing in "that stuffy dark-room," I beg to refer him to Captain Abney's "Treatise on Photography," to which I am indebted for much of the substance of this letter.

Trusting that you will consider the above of sufficient interest and importance to find a place in your columns, I remain, yours faithfully,

C. J. DAVIES.

May 12th, 1890.

* * * *

DARK-ROOMS AND REDUCED HOTEL TARIFFS.

SIR,—In common with many other members of the Cyclists' Touring Club, who are also amateur photographers, I perused with some little surprise the editorial announcement in your issue of the 2nd inst., to the effect that you were about to endeavour to obtain—for such of your readers as were willing to remunerate you for your labours—the use of the dark-rooms, and the benefit of the special tariffs of the hotels already secured by the Cyclists' Touring Club.

That surprise was, however, considerably increased by an inspection of the paragraph in your paper of last week, wherein you allege, *inter alia*, that your thanks are due to myself "for the help rendered us."

If this statement be an acknowledgment of your indebtedness to the Club I represent, in that it has provided you in its Hand-book with a published list of hotel head-quarters, and quarters already under legal contract with it, as well as with a reliable list of temperance houses recommended from long experience, as the ground upon which to exploit your purely commercial crusade, that fact might have been made frankly apparent; if, however, it is intended to convey my official, or even my private, concurrence in your plans as now made public, I must, in justice, beg you to allow me to state that, so far from having assisted you in your efforts, I regard the whole scheme as the outcome of plagiarism pure and simple.

Having thus made clear my individual opinion of your recent move, I may, perhaps, be permitted to add that, while I could have wished that greater originality had been displayed, and that your management had possessed sufficient courtesy to inquire whether or not the Council of the Cyclists' Touring Club had any objections to urge against the wholesale circularising of the proprietors of its head-quarters, in which you have recently indulged, I am not such a dog in the manger as to object to others sharing in the benefits my Club has secured for its photographic members as such. On the contrary, I am of opinion that as far as the use of dark-rooms and changing cupboards is concerned, the greater the demand that arises for this accommodation the greater will be the facilities placed at the disposal of all of us. The tariff question, however, stands upon another footing, and the landlord is not a free agent, as the following clauses from the legal agreement into which he has entered with the Cyclists' Touring Club will testify:—

(1) That he will at all times receive and entertain any of the members of the said Cyclists' Touring Club, whether ladies or gentlemen, who may produce upon application a valid ticket of membership for the then current year, and that he will charge them a tariff of prices which shall in no case and under no circumstances exceed the following:—(Here follows tariff "A" or "B.")

(2) That he will charge the said reduced tariff only to the bona fide Members of the Club, but they shall first be required by him to produce their respective and individual tickets of membership for the then current year, and further that he will not accord or admit to any privileges, benefits, or reductions derivable under this agreement, any cyclist or tourist who does not, by producing his current certificate of membership, prove that he is a member of the Cyclists' Touring Club.

It is true that the landlord may, with a view to extending his business, violate both the letter and the spirit of the latter paragraph; but should he consent to give to outsiders the same privileges and reductions as those to which the members of a club some 20,000 strong are entitled—a club which, at very considerable cost and no inconsiderable labour originated and perfected, greatly to the benefit of landlords as a body, the scheme you now coolly propose to bodily appropriate—he

cannot complain if the patronage of his first and best customers is diverted elsewhere.

As an amateur worker I am, I hope, in sympathy with every disinterested movement having for its object the advancement of photography; but I may, perhaps, be excused for expressing the opinion that such movements as the inauguration of institutes, the controlling of exhibitions, including the judging of "pictures," the organising of dark-rooms and hotel accommodation, and all similar matters are better left to photographic or other amateur associations, who, from their very constitution, are raised above the purely commercial element and the desire for self-advertisement. That this view has already commended itself to all the best-known workers in photography is a fact, of which even you must, ere this, have had abundant evidence.—Yours faithfully,

139 and 140, Fleet St., E.C.

May 13th, 1890.

CHAPTER X.

Intensification, Reduction, Varnishing, Preparing the Negative for Printing.

PHOTOGRAPHER.—When your negative is dry, and you do not feel quite sure that it has the right intensity, you may take a print if you like, taking care that you do not use damp paper, which would infallibly produce spots in part of the unvarnished plate. If you find that the image is too thin, you may proceed to intensify it. There have been many methods proposed for performing this operation, but for the sake of clearness I will confine myself to the one I know to be quite efficient, and, as far as the experience of five or six years can tell us, quite permanent. Place the negative in water for a quarter of an hour while you prepare the following:—

Bichloride of mercury (saturated solution)	1 part
Water	2 parts

Immerse the negative face up in a bath of this solution, and watch the effect. The dull grey brown of the image quickly assumes a lighter grey colour, and if left for a longer time would become nearly white, but it will usually be found sufficient to remove it at the grey stage. The plate must now be thoroughly washed, at least one hour as before. The only preventive of stains is thorough washing. The next parts of the process is to place the negative in a saturated solution of common washing soda, where it may remain some minutes; the time is not important, as no further change takes place after two or three minutes. Another thorough washing must follow. You will find that the negative has increased in intensity and is of an agreeable printing colour. It is usual to employ a very weak solution of ammonia, which produces a black colour, for the final bath, but I much prefer the colour given by soda. Both the mercuric and soda solutions may be used many times over; indeed, the mercuric improves by use by losing its rawness. The solution I am using is quite five years old, if any of an old, constantly replenished solution can be said to exist. If the negative is still too weak, the operation may be repeated.

There is just one kind of image that it is impossible to intensify with good effect—I mean the much over-exposed or fogged variety. You will easily see that if the plate is fogged all over, the effect will be to intensify the fog as well as the legitimate image.

If your negative is too intense it may be very easily reduced. There are, of course, many ways of doing this, chiefly with some of the iron salts, but the resulting colour is often yellow and deceptive. I have tried many of them, but never found any to equal the following for simplicity and perfection of result:

Mix, by measure, one part of saturated solution of alum, with two parts commercial solution (it is only sold in solution) of hypochlorite of soda. Filter off from the white gelatinous precipitate. Keep the filtered liquid in a tightly stoppered bottle; it quickly loses strength on exposure to the air. Add one part of the mixed solution to four parts of water, and drop the plate—which should have been previously soaked in water—into a tray of it. With a fresh solution the face of the image quickly changes to a grey colour by the formation of a chloride of silver compound. Throw away the solution, give the plate a good rinsing under a tap, and put it into a bath of about three ounces of hyposulphite of soda to one pint of water for ten minutes. This dissolves the newly-formed silver chloride, and removes evenly some of the density of the negative. Wash and dry. If still too intense, repeat the operation. The one precaution to take is, not to let the negative remain too long in the reducer, for a freshly made solution is quite capable, if given time, of eating the image entirely away, and leaving bare glass only. However, short of that catastrophe, an over-reduced image can to some extent be recovered by re-intensification, but it is not safe to rely much on this.

PUPIL.—Really there seems to be a great deal to do before you bring your negative to perfection.

PHOTOGRAPHER.—You must recollect that it does not follow that every negative should go through all these vicissitudes. Intensification and reduction must be considered as necessary evils which enable us to correct errors; it is nearly impossible to always avoid. I suppose that no photographer always exactly hits the density he desires. But to continue.

When the negative is to your mind, it should be varnished. I know that many photographers hold that this is not necessary. Perhaps they are right when a few prints only are required, but it is a risky and slovenly practice. Varnishing is a simple operation, but not always properly performed, so I may as well show it to you. Warm the plate well, to drive out any moisture that may be in the film, before the fire or over a Bunsen burner on which a piece of plate iron is placed to prevent the flame igniting the varnish, and let it cool. Now take the plate by corner No. 1, dust it with a flat camel-hair brush, pour a pool of varnish on the centre

of the negative, tilt first to corner 1, then round the plate to corner 2, then 3, and drain off into the bottle at 4, giving the plate when upright a slow lateral or rocking motion to cause the lines of varnish to coalesce and prevent crappiness. All these movements should be made with deliberate slowness, and not a drop of varnish will be spilt. The plate must now be held over the burner until quite warm, and the varnish will dry hard and bright. Care must be taken to keep the plate nearly upright until the varnish is set, or a return wave may cause a thick ridge at the edge of the nega-

tive. It should not be used for printing for some hours after varnishing.

PUPIL.—At last the much worried bit of glass is ready for printing.

PHOTOGRAPHER.—Not yet. Not one negative in a dozen is ready for printing right away. We will put this one on a retouching desk and consider it.

PUPIL.—Is this where you put the "inner meaning" into the negative?

PHOTOGRAPHER.—Don't be satirical. The inner meaning of nature is nothing to you yet. You must have some experience—it used to require a lifetime, but three or four years is considered long enough now—before you may hope to have "insight" and use the occult terms of art; and then you must not expect to understand what you mean.

PUPIL.—Does that matter?

PHOTOGRAPHER.—Apparently not, but some think it sounds well. I cannot recommend much interference with a landscape negative. Here are a few spots and pinholes caused by dust; they may be stopped out with water-colour, and here is a "pit" in the film that will require careful filling up or it would print as a dark round spot, which would surely not add to truth. Then the sky is dense, and will print as a mass of blank white paper, which would not help to give a true impression of the scene as seen by an artist. By means of combination printing we may remedy the defect of photography, which only under rare circumstances gives the sky in keeping with the landscape. To do this it is well to have in stock a large collection of skies (of your own taking, of course) all dated and with notes added of circumstances, light, effect of the scene, etc. Those who mistrust their own knowledge of nature recommend that the cloud negative should be taken at the same time as the landscape, for fear of not being absolutely true if taken at a different time, but anyone who has studied the times and seasons of nature, and her appearance under different aspects, is not likely to go far wrong. The clouds must be taken quickly, but not necessarily and of course with a shutter set to work as quickly as possible, as recommended by an inexperienced writer. I much prefer using slow plates and a slow shutter, or the hand. I have exhibited many landscapes in which the sky has been a prominent feature, but never one taken with a shutter.

PUPIL.—Is all this legitimate?

PHOTOGRAPHER.—I consider almost anything legitimate, short of painting on the print, that makes the final result more like nature—or the truth of nature, as some superfluously call it. The difficulty is that any interference with the negative is so seldom well done. Retouching in portraiture has been carried to such a perilous pitch that nature has been forgotten; yet some retouching is absolutely necessary, or photographs would as much err on the side of freckles, exaggerated lines, and other disfigurements as on the side of the petrification of nature as now practised. The fault is that too much is done, of the highest skill, I grant, as regards the delicacy and fineness of manipulation, but with very little heed to nature. In landscape much less is done, because much less is possible. Something, however, can be done, but if unskilfully is worse than useless and brings discredit on the art. I will very briefly mention some of the things that are possible.

If you want to add a sky, and the sky of the negative is not dense enough to print white or nearly white, it may be stopped out with Bates' black varnish, as a rule on the back of the negative, but there are occasions when touches may be given on the varnished side.

If some parts of the negative come too light, a piece of *papier minérale* may be pasted over the back, and when dry the parts that require most printing may be scratched out.

We won't have anything to do with artificial skies, or cotton-wool clouds; they belong to a bygone day.

There are such things as local reduction and intensification of the negative, but we won't interfere with nature to that extent, although I have seen local development recommended by some of those who pretend to truth to nature. A great deal may be done in proper hands with black varnish and *papier minérale*, but I cannot recommend you to go much further in correcting or improving the negative.

(To be continued.)

The Electric Light and Photography.—III.

By T. C. HEPWORTH, F.C.S.

MANY photographers would be very glad to adopt the electric glow lamp, on account of its cleanliness, freedom from smell, absence of danger, and other good qualities, if they only knew the best way of installing it in their dark-room without much expense. For occasional use in changing or developing plates it undoubtedly is most convenient, and there is no reason why it should not be employed for such purposes, even if we are dependent upon some form of battery for its maintenance. But the kinds of battery which are described in the text-books are legion, and it is difficult for one not well versed in the subject to choose between them. The first thing that must be understood is that one battery may be invaluable for a particular service, while it is quite unsuitable, and, indeed, useless for another. For instance, no battery is better for the ordinary electric bell, now so commonly used in houses, than the Leclanché. It will give sufficient current for a short period, but requires intervals of rest so that it may recover its original energy. This is just the treatment which it receives, the circuit being closed whenever the button is pressed, and being left open for the battery to recover itself between times. Where, on the other hand, the current must be a constant one, continuing over many hours, as in the case of electric deposition of copper, silver etc., the Leclanché form of battery would be useless, for it would soon cease to act. For this purpose we must use a Daniell or a Smee. Where, again, we want a current of great power to produce an arc light, we must have recourse to several Bunsen or Grove cells—that is to say, if we are dependent upon primary batteries. Secondary batteries will be considered later on. But for a single incandescent lamp such as would give sufficient light for the purpose already indicated, there are certain newer forms of battery which are far more convenient in use, and which do not give off acid fumes like some of those mentioned. One in particular may be mentioned as affording effective results with little trouble and expense—I mean Schanschiff's battery. It is a single fluid battery, and the charging of it merely means the emptying out of the spent liquid, and filling it up with fresh solution. The liquid is a preparation of mercury, but its exact composition has not been published. The battery can be kept ready for use, provided that the plates are lifted out of the solution when it is idle. Its electro-motive force is constant, it gives a very steady current, and its internal resistance is small. It is durable in use, and the replenishing solution is cheap. One charge of liquid is said to maintain a 2-candle glow lamp for eight hours. The annexed outline drawing shows the various parts of one form of Schanschiff's battery with small incandescent lamp attached. This is for miners' use, but it is obvious that, with one or two slight modifications, including a red screen for the light, it would be useful in a photographer's dark-room. At any rate, the drawing will serve

to indicate the positions of the battery elements, and the way in which they are raised out of the exciting liquid when the instrument is not in use.

The containing vessel A is of gutta-percha, and is divided by walls of the same material into three compartments, which form three distinct cells. The lid or top of this containing vessel, B, is made of hard wood, and fits closely into it. It has a handle, D, by which it can be readily carried about, and the glow-lamp bulb, F, is protected by a thick glass, E, which would be necessary to protect the fragile bulb from splinters of coal, etc., when the lamp was being used below ground. As there are three cells in this form of lamp, there are, of course, three sets of elements provided for them. These consist each of a stout rod of zinc; one only is visible in the drawing, and is marked Z, flanked on each side by a plate of carbon, C. One carbon plate is in each case a little narrower than its fellow, so as to accom-

modate itself to the triangular form of the cell in which it is placed. Returning to the upper part of the arrangement, G is a metal reflector, which half embraces the incandescent bulb, and greatly increases the light which it gives. It remains only to mention the manner in which the plates can be raised from their cells in order to throw the battery out of action. A metal vertical rod projects from the centre of the containing vessel, where the three partitions of the cells meet. It is not visible in the drawing, being hidden by the edge of one of the carbon plates. It is tapped with a screw thread at its lower part, and also at its top, so that the milled disc, H, will engage it in two different positions. One of these is where the plates are immersed in the liquid contents of the cells, and when, therefore, the lid can be securely screwed up, and the other position is that shown in the drawing, where the plates are raised from the cells and all electrical action ceases.

I have had another form of this battery in use for some time with satisfactory results. In this arrangement the plates are at one end of a long and closed receptacle, and the mere act of inverting the arrangement puts it into action. When it is required no longer, it is again turned upside down, the liquid leaves the plates, and the light is quenched.

One of the most useful forms of battery is the bichromate, but constancy of current must not be expected from it. It is a most handy form of battery for the laboratory, for it can be put into and out of action in a second. It gives off no fumes, and the solution employed is quite inexpensive. Its most common form is that of a bottle with a vulcanite top. From this top depend the plates, two of which are carbon, and fixed, while the zinc plate slides between them, and is fastened to a brass rod which projects through the lid. The exciting fluid is a saturated solution of bichromate of potash, made with hot water, with 20 per cent. of sulphuric acid added to it when cold. The addition of the acid causes the development of much heat, and the solution must be allowed to cool before it is poured into the bottle. There are several modifications of this form of battery which may be made very useful in the photographic dark-room; and where the amateur is possessed of sufficient ability to construct apparatus for himself, this is the kind of battery which he will have no difficulty in producing without outside help.

(To be continued.)

The Stereoscope.—II.

BY VALENTINE BLANCHARD.

THE increased facility of production furnished by the collodion process really gave the stereoscope its far-spread popularity, for the cost of the slides was at once reduced enormously. So rapid became the demand, and so eager the demand for novelty, that the energies of the first workers were severely tried. Photographers were sent to all parts of the world, and every building of historical importance or architectural beauty was made to lend its "counterfeit presentment" to show forth the wonders of Brewster's new instrument.

It will be interesting to many old photographers to know that T. R. Williams, so well known as the first photographic portraitist of his time, commenced his photographic career as a producer of daguerreotype slides. He began with still-life subjects, then so much in demand, and drifted into portraiture in furnishing novelties for the stereoscope. The portrait slides of Williams, Claudet, Mayall, and others were always to be seen at the Photographic Society's early exhibitions, but in the estimation of the photographers of that time the first place was taken by T. R. Williams.

Mr. W. England, who is fortunately still with us to give to modern workers the benefit of his varied experience, was also a large producer of daguerreotype slides, but he also was one of the first to take up the collodion process, for with practical eye he saw the importance of the increased facility of production furnished by it. After making a series of castles and abbeys in England, he went to America, and was fortunate in securing a picture of Blondin crossing the Niagara on the tight-rope. So little was known of the possibilities of photography thirty years ago, that when he sent a copy to the *Illustrated News* they refused to engrave it, fully believing it to be a hoax, and were vexed afterwards to find they had missed an opportunity. It will astonish many amateurs to know that his instantaneous street views of Paris for the stereoscope, taken about 1860, have never been surpassed, notwithstanding all the advantages offered by

the present method of working. An old photographic joke of this period in connection with his name may be mentioned here:—"Have you heard the news? England has taken Paris."

To satisfy the craving for novelty which marked the fever-point of what may now be called the stereoscopic craze tasked the ingenuity of the slide producers. The eager public were not content with the wonders of the world brought home to them to be looked at through the marvellous little instrument; they wanted the impossible, and made-up pictures. That is to say, copies of well-known sentimental pictures where painted backgrounds and dressed-up living models were employed to enact the drama or tell the story, became the rage. As a consequence we had "The Last Appeal," "The Prisoner's Release," and many other similar subjects, a long way after the originals by Frank Stone, Millais, and others, as may be very well imagined.

For a time domestic scenes became more in constant demand, and tea parties, dinner parties, weddings, christenings, etc., were to be seen in every shop window where slides were sold. The late Mr. Spooner, the well-known publisher in the Strand, told the writer some time ago, with some pride, that at the request of a popular manufacturer of slides he had consented to take the part of the clergyman in many of these scenes. Those who remember his genial Pickwick-like face will see the fitness of the selection. "Yes," said he, "few people who come to buy photographs know what a large business I have done in the marrying and christening line. Mr. — wanted so many negatives that for several days I did nothing else—one day marrying all day long, and next day christening all day long, till I was quite tired of the fun."

Elaborate historical scenes were attempted, and studios of immense size were erected to make them possible. An early riser passing Burlington House, now the home of the Royal Academy, was startled by an amazing and most unusual sight. In front of the house in Piccadilly adjoining old Burlington House was to be seen a horse suspended in mid-air between the glass-covered roof and the pavement below. Yes, a horse, but not a live horse, only a stuffed one, which was finally hauled with great difficulty through the open window of the studio above. We saw the horse under more favourable circumstances shortly after, doing duty under the weight of Joan of Arc armed cap-a-pie and surrounded by her followers. The patient animal bore many other riders besides the devoted Joan, and, to judge by its stolid expression, did not seem to mind the work.

It need scarcely be said that very few of these ambitious attempts at picture making could be regarded as successes. The self-consciousness of the models invariably spoiled even the best of them. They satisfied the whim of the time, however, and are now interesting curiosities.

French taste took a somewhat different form in the production of groups in the stereoscope. Small wax figures were carefully modelled, and whole scenes from operas were elaborately built up, and such subjects as the grave-yard scene from "Robert le Diable," and the Walpurgis Night from "Faust" startled and fascinated the eager buyers; for besides the immense number of figures employed the effect was heightened by high colouring both in front and back, for the paper photograph was made transparent by soaking in wax, and was mounted like glass transparencies. To still further increase the horror of the supernatural scenes, a cut-out moon, made sickly by backing with pale yellow gelatine, and picked-out lights for fires and reflections gave a lurid or a corpse-like hue, according to the colour of the gelatine employed for the desired effect. A supper party of skeletons will be probably remembered by many. Some of the subjects were very French indeed, and more need not be said here to de-

scribe them. It must be said of them all, however, that they were wonderfully carried out, and were far more complete as pictorial representations than the English productions with live models.

A notice of French productions would not be complete without mention of the glass transparencies of Ferrier, for these had a perfection that has been rarely equalled and certainly never surpassed. To describe the tone of a modern gelatine transparency we still say it is *nearly* the colour of a Ferrier slide.

In landscape and more especially instantaneous photography, Wilson, of Aberdeen, stood for years pre-eminent; but, as we shall have occasion to mention some of his methods of working when we come to the practical part of our subject, we need not dwell further on his work at this point.

(To be continued.)

How to be Photographed.

BY J. HUBERT.

In these days of keen competition, when the intending sitter cannot always feel sure that the photographs he may admire in a window or show-case are of the same quality as he could reasonably expect to obtain there—a great many dishonest men even going so far as to exhibit work not their own—it is a long-felt want to have some guide which will enable the sitter to make a suitable selection of the particular establishment which is most likely to give the greatest satisfaction.

The question of expense is, as a rule, an immediate attendant upon the desire to possess a work of art and a commemoration of pleasant hours spent in the company of dear friends, or reminiscences of scenes which but for photography would not even have left their shadow behind them.

There is not the least doubt that it is more than difficult to convince some people that it is quite possible to obtain the highest class of work at moderate prices. On the other hand, there are those, especially such whose friends practise as amateur photographers and communicate to them the cost of material, who think that cheapness is the desideratum which should, if not precede, at least have an equal share in the determination of their choice.

As a badly made dress of the finest material is a perpetual eyesore, so an inartistic photograph, made with the best chemicals and first-class instruments, is always distasteful. There are few dressmakers who fit well, and those who do so command a good price, how then can a photograph, which requires infinitely higher art, be executed at such prices as 3s. 6d. or 5s. 6d. per dozen?

Some folks often say that they would on *no account* go to such a cheap place, advertising 3s. 6d. per dozen, emphasising it by "What can you expect there?"

They go to the medium man at 5s. 6d. per dozen, and call the one who charges 7s. per dozen dear, but it stands to reason that photographs at less than 7s. per dozen in the suburbs, where rents are cheaper, and 10s. in the City and West End, where they are dearer, cannot be profitable enough to warrant special effort. It is quite certain that those who pin their faith upon the 5s. 6d. per dozen exponent might just as well go to the one whose prices are 3s. 6d. per dozen, and who more often than not exhibits other people's work as an inducement to get custom. But as the most expensive milliners are not at all times the best, so the dearest photographers are by no means always A1.

Upon whom then shall our choice fall? I say most emphatically the best *local* artist. Why so? Because such an one has the highest interest to serve those well who,

living in his neighbourhood, are a certain and continuing testimony to his skill, whereas the distant photographer seldom cares to take exceptional trouble with people whom he knows not, and may never again set eyes upon.

Furthermore, to make sure of the best man, look into his show-case. He will generally exhibit local men, who are well known to you. Examine the likeness, see whether the position is natural and the expression is life-like and pleasing. If he is established a good many years, so much the better.

If you are a stranger, and cannot trust your own judgment, ask not one, but *several* neighbours, who the best photographer may be. Although every successful man makes some enemies, the voice of the majority cannot be far wrong.

Having determined where to go, it will be well to make sure what atmospheric conditions suit our purpose best. Do not entirely trust the man who advertises "Weather no object. All photographs taken instantaneously." He may be the one who would take your money, but *little* trouble forsooth.

If it is at all within the range of possibilities, the sitter should come in the morning, not because it is impossible to be photographed in the afternoon, but he generally feels in a better mood then. His or her daily cares have not as yet stamped their impress upon the brow, that should be particularly fresh, and free from pain of any sort, to be in the best condition for what some unnecessarily think a trying ordeal. Moreover, the morning light is better than that later in the afternoon, which, although it may look precisely the same to the untrained eye, is not nearly so rich in those rays which form the photographic image, it being well known by spectral analysis that the bright-coloured yellow or red rays are the least useful for the purpose of photography. For instance, the ordinary observer sometimes reasonably imagines that when the sun just begins to set it is still light enough for the (*rapid*) drawing by means of light, which is the meaning of photography, but the scientific observer notes the peculiar yellow or redness of the luminant, and finds also that the light which reaches us through the medium of a fog is of the same yellow colour, inactive to photographic chemicals. The beautiful colours of the rainbow, so familiar to us, afford a striking example, to convey the meaning of the spectrum to those who are not acquainted therewith, because the light of the sun in its passage to our orb passes through one mass of great prisms, composed of rain-drops, which serve to subdivide the white light of Mother Sol into its constituent rays, so forming what are called the colours of the spectrum, the principal of which are blue, green, yellow, and red.

This range of colours, with its intermediate tints, is the same as that thrown on to the opposite wall of a darkened chamber, on the one side of which a hole is made to admit a ray of sunlight, which in turn is made to pass through a triangular-shaped piece of cut glass, called a prism; this, if photographed upon a sensitive plate placed into its focus, will prove that the yellow, orange, or red colours have left no impress on the film, whereas the violet and blue show a very marked blackening, from which fact it will be seen why these latter are termed chemically actinic rays. This explains also how it is that a yellow, orange, or green dress photographs a dark shade, and a violet or blue one appears light.

A clear, rainy morning, with light clouds without sunshine (unaccompanied by fog, however), is most suitable for photography, because, as will be manifest to the thoughtful, the rain acts somewhat like a condensing lens; instead of obstructing, it rather intensifies the light. Were it, therefore, not for the drawback of soiling one's attire (which, however, can be obviated by employing one of the multi-

tinuous conveyances plying everywhere in the metropolis and suburbs), such a rainy day is often better than one on which the sun gratifies us with one of its rare and uncertain visits; that is, if we can contrive to banish the weather clouds which are usually exhibited by sympathetic men or women, when the skies are weeping.

Again, the morning is best for babies and children, who, after a refreshing sleep, may be said to be in first-class condition to be operated upon at a time when the brightness of the light permits of a very short exposure.

I carefully avoid the hackneyed and misleading expression instantaneous, for any honest and scientific photographer knows that instantaneous photographs cannot be taken in an art studio (although they may be taken by the instantaneous process), but bringing babies, young children, old people, and invalids in the morning, the time of exposure—thanks to latter years' improvements—is reduced to half, one, or two seconds, whilst with the most artistically lighted cabinet and whole-plate portraits, four to six seconds' duration is seldom exceeded.

Through non-observance, or the dexterity of the artist, this time is not generally distinguished, and thus it comes that the word instantaneous is totally misunderstood.

At first sight it may seem superfluous to acquaint the customer with the niceties of the distinction, but when the photographer is confronted with such exclamations, by a sitter entering the studio during a fog, as, "But, Mr. Camera, I thought you practised the instantaneous process, and the weather is immaterial," it becomes imperative to analyse the meaning of the word. Pictures practically taken instantaneously are open-air productions, secured, for the most part, during sunshine or by artificial light, with which the writer has made such experiments as to be able with certainty to take fairly good instantaneous photographs. At present he cannot, however, for various reasons, advise the process unless daylight is quite unavailable, in which latter case it is indeed a good thing when done by a *specialist*, which the writer professes to be, having a method of his own with which he produces work which could not be distinguished from good daylight. When the sky is overcast with white clouds the light is better than on a sunny day with a clear blue firmament, because the illumination of earthly objects is principally caused by reflected light of the sky, hence it follows that the white cloud reflection is more powerful than the blue sky (always, of course, considering studio portraiture). For similar reasons, the light is good when the snow lies on the ground. There is another most important reason why people who can possibly do so should choose the morning, it being the photographer's least busy time. Waiting irritates, which is detrimental to a good expression. To avoid which delay it is advisable to make appointments with the artist.

The question of dress, which I have purposely left to the last, claims our serious attention.

First of all, it is exceedingly unwise to be attired in a totally different style to what we are accustomed to, which is especially noticeable with regard to ladies' headgear, which alters the likeness even sometimes.

A well-fitting dress is a great advantage, but it really matters not of what colour it may consist, unless the sitter requires a speciality. A white or delicate cream-coloured dress in the hands of an artist gives a splendid effect, the gradation of light and shade looking particularly beautiful, besides facilitating the production of a harmonious picture. With children, white or pale cream dresses are the best in all cases.

It must not be imagined, however, that the dress need be newly washed and starched. A soiled one is to be preferred, and is never a drawback unless excessively creasy.

It should be noted that a pale complexion is intensified by the contrast of a dark attire. White or delicate hues are always suitable for pale complexions. It has been mentioned that green, yellow, orange, or red stuffs come out either a lighter or deeper black, according to the above order.

With this knowledge then it is easy to blend colours to attain any desired contrast. Thus gold or yellow coloured ornaments show little upon a dark-ground; the same can be said of silver upon a white one. Red hair should be powdered, or else will photograph abnormally dark.

When it is absolutely requisite or desirable to possess a photograph which will render colours more correctly—such as we see in nature—that is, the yellow of a lighter shade than blue—that may be done if the photographer is made acquainted with the wish. The author does not think it an advantage at the present to use the process exclusively, because the kind of plates he prefers for studio work are not so prepared, besides other difficulties standing in the way.

In conclusion a few other hints may not be unacceptable, and it can be taken as a maxim that a person compelled to wear spectacles should not take them off when photographed, as the result would be unlike in consequence of the altered focus of the pupil of the eye.

Babies should never be brought late in the afternoon. They are generally at their best after a refreshing sleep. As a rule, fathers should not bring young children, as they are very apt to become impatient, and lose their temper with them.

It is essential that mothers should leave all arrangements to the artist, as if such an one is what he professes to be, he will be able to manage the baby or young child, for the time being, better than the best of mothers.

The mother or attendant should in *no case*, as is done in most instances, take in hand or play (for children's amusement) with any of the toys found in the studio, as the photographer uses them as a valuable reserve to gain the attention of the little one. For if the child is once allowed to see or play with them they are entirely useless for the photographer's purpose.

It is also very important indeed that the attendant abstain from giving any directions or advice of any sort to the child whilst in the operating room, for in almost every case the child will be found to do exactly the opposite of what it is told, or follow the advice in an exaggerated degree, pressing its lips tightly together when asked to shut its mouth, and so forth; therefore the child must never be coerced into anything. It should not even be persuaded to sit quite still when in the studio, for as soon as a child endeavours consciously to follow such instructions, all natural grace is gone.

In consideration of the state of unrest in which children generally are found when in an animated or expressive position, it will be evident that to obtain works of art in that branch the artist must not be limited to prices which only admit of the expenditure of one plate and certainly do not provide for the often necessary jumping, barking, laughing, singing, and conjuring performances to be gone through by a photographer, whose aim it is (if he has received a thorough art training) not alone to please his customers but to satisfy his ambition, without which no man ever dares to hope for certainty to take satisfactory photographs in this progressive age of ours. There are, unfortunately, some customers whom the local photographer can never hope to attract to his studio, viz., those aspiring but not really belonging to the highest society. That particular class require the West End trade mark on the back of their cartes, scorning to go outside that locality,

even though the local artist may execute the best work. This is, however, somewhat compensated for by the patronage of the few of the élite of society, who can afford to visit the local establishment without loss to their dignity.

Our Contemporaries at Home and Abroad.

THE *Photographic Times* (New York) gives the following amongst others of Mr. Cramer's formulæ:—

"EIKONOGEN DEVELOPER.

No. 1.

Distilled water ..	40 ozs.	1,000 c.c.m.
Sulphite of sodium crystals ..	2 "	50 "
Eikonogen, finely powdered ..	1 oz.	25 grammes.

Keep the solution in a well stoppered bottle.

No. 2.

Water ..	10 ozs.	300 c.c.m.
Carbonate of potassium ..	1 oz.	30 grammes.

No. 3.

Water ..	10 ozs.	300 c.c.m.
Bromide of potassium ..	1 oz.	30 grammes.

For Use.

Solution No. 1 ..	3 ozs.	120 c.c.m.
Solution No. 2 ..	1 oz.	40 "
Solution No. 3 ..	.6 to 12 } minims (or drops)	$\frac{1}{2}$ to 1 c.c.m.

When the developer is quite new, it will be found necessary to add a little bromide solution (No. 3) in order to make it work perfectly clear. The addition of old developer will answer the same purpose. The developer can be used repeatedly by occasionally adding more of solutions Nos. 1 and 2, omitting the bromide. It produces plenty of intensity by simply leaving the plate in it long enough. Any degree of softness can be obtained by diluting with more or less water, which is also recommended during hot weather and for under-exposures. Over-exposed plates restrain by adding more solution No. 3. The following fixing formula is especially recommended:

Water ..	1 quart	1 litre.
Sulphate of sodium crystals ..	4 ozs.	120 grammes.

After being dissolved, add

Sulphuric acid ..	$\frac{1}{2}$ oz.	15 c.c.m.
Chrome alum, powdered ..	3 ozs.	90 grammes.

Dissolve, and pour this into a solution of

Hyposulphite of soda ..	2 lbs.	1 kilo.
Water ..	3 quarts.	3 litres.

This bath combines the following advantages:—It remains clear after frequent use, it does not discolour the negatives, and forms no precipitate upon them. It also hardens the gelatine to such a degree that the negatives can be washed in warm water, provided they have been left in the bath a sufficient time. The plate should be allowed to remain in the bath five to ten minutes after the bromide of silver appears to have been dissolved. The permanency of the negative and freedom from stain, as well as the hardening of the film, depend upon this." Articles: "A Photographic Trip in the Torrid Zone," "Orthochromatic Photography," "Origins and Progresses of Photo-Engraving," "Living Organisms as Photographic Negatives," etc.

Wilson's Photographic Magazine (New York) says, "If the invention of Mr. W. J. Norton, of Pittsburg, fulfils its promise, says the *Chicago Journal of Commerce*, there is a dangerous rival of the electric light in the field, if not of petroleum. He has invented what is alleged to be the cheapest light ever known, and yet 'a light as intense and as accurate in its illuminations of colours as the sun at noonday.' It is claimed that 500-candle power light of the kind in question can be run at the nominal cost of 1 cent an hour. Mr. Norton has for years been engaged in developing this light. The undertaking has been very quietly conducted. Recently he permitted a few capitalists from Beaver County to witness experiments with his device. These tests proved so successful that a temporary and private company was

soon formed to patent and develop the brilliant idea. The light in question is essentially a chemical discovery rather than a mechanical idea, and consists of a peculiar tape that is fed by a simple clockwork. While it is peculiarly adapted to street or other stationary purposes of illumination, yet it is said to be also applicable to portable or hand-lamps; and in point of intensity it is not surpassed by electricity, its light is much softer, and far easier to the eyes. It feeds itself, requires neither pipes, wires, or other connections, and in size may be produced from 300 to 7,000 candle-power. It is absolutely non-explosive, emits no smoke or objectionable vapour, is applicable to any purpose, and can be handled with an equal safety by a child as by an adult. We should imagine this light will open up new possibilities in our art." Articles: "Group Photography," "The Screen Plate for Phototypography or Zinc Etching," "Practical Points for the Studios," "Facts and Fancies," etc.

Anthony's Photographic Bulletin (New York) says, "Last week it gave us pleasure to note a matter of photo-historical interest to ourselves, and one which we think will be of equal pleasure to our readers, regarding Daguerre. On the occasion of a farewell dinner which was given to Colonel Gouraud, who was about to return to England, carrying with him General Sherman's reply to the speech of the 'Grand Old Man,' Gladstone, to bring which to this country was one of the main objects of his coming, Colonel Gouraud took occasion to refer to photography, and stated that at the time of the discovery by Daguerre, he (Daguerre) and Colonel Gouraud's father were intimate business friends, the former in France and the latter in America; that Daguerre sent to the elder Gouraud the first instrument for making daguerreotypes which ever came to America, and the first picture ever made with the instrument, and consequently the first daguerreotype made in this country was made by him, and the sitter was his wife and the mother of the speaker, who further stated that the picture was still in existence, and naturally highly prized by his family." Articles: "Albumen Paper and the Tariff," "On the Development of Gelatine Dry Plates," "Preserving Ferrous Oxalate Developer," "Addition of Formaldehyde-Bisulphite of Soda to the Gelatine Emulsion and to the Developer, etc."

BRIXTON AND CLAPHAM CAMERA CLUB.—At the meeting of the Club to be held to-night (Friday), a paper will be read by Mr. J. Gale, entitled, "Photography as a Pastime." The paper will be illustrated by a selection of his well-known slides, shown by the oxy-hydrogen lime-light. Visitors are invited.

HOLMFIRTH AM: PHOT: SOC:—Mr. J. Roberts, of 1, Victoria Square, Holmfirth, writes us:—"We are reorganising the Amateur Society in this town. I shall be greatly obliged if you will kindly make it known through the medium of your valuable paper that anyone who may feel disposed to join us, if they will communicate with me can have all particulars."

GOVERNMENT RECOGNITION OF ZOOLOGICAL PHOTOGRAPHY.—The British Museum (South Kensington) authorities have just ordered a large number of the animal studies from life, and skeleton series, taken by Mr. Gambier Bolton, F.Z.S. (of the Camera Club) to be framed and hung in the galleries of the Zoological Section. This is believed to be one of the first instances on record, and shows that photography is slowly, but surely, making its way upward in the scientific world.

CAMERA CLUB.—On Thursday, May 8th, there was a special lantern-slide exhibition at the Camera Club, photographs taken on recent tours in Egypt being shown by Messrs. Rodgers, A. Collins, and Major Nott. Amongst the transparencies were many of excellent quality, and the collection contained a great variety of interesting illustrations of present life and manners in Egypt, with original views of the Pyramids and other remains and public buildings. Mr. Elder exhibited a large number of photographs recently taken in Madeira and Tenerife, Mr. Andree gave some interesting views of volcanoes in action and other subjects, Mr. Ferrero landscapes taken on club excursions, and Mr. Crookes some charming pictures of Ightham Moat-house; other slides by Messrs. FitzPayne, Carnell, and Sands were exhibited. On Thursday, May 22nd, Mr. Shipton will read a paper on "Cyclo-Photography—Some Recent Developments, including an Ideal Cycle."

Science Notes.

At the meeting of the Royal Microscopical Society, on April 16th, Mr. J. Mayall, jun., exhibited a spiral ruling on glass, sent by Mr. P. Braham, of Bath, which had been produced in an ordinary lathe, the diamond point being adjusted on the slide-rest. A series of photo-micrographs, by Mr. T. Comber, were of special interest, since they had been produced by the aid of sunlight, by which the maximum resolving power of the objective is obtained.

The grand 26-inch refracting telescope, one of the largest in the world, bequeathed by the late Mr. Newall to the University of Cambridge, was of doubtful use without funds for its maintenance. The difficulty has been solved by the son of the donor, Mr. H. F. Newall, of Trinity College, volunteering his services as observer, and also finding the necessary money, £500 for initial expenses, and £200 per annum for five years. We trust the Newall telescope will prove a worthy rival to its great 36-inch brother, the Lick telescope, in California.

The Photographic Society of France has lost its President, the distinguished chemist, M. Eugène Peligot, who was seventy-eight years of age. He had been attached to the French Mint for over forty years, and was a pupil of Dumas.

A contributor to the *English Mechanic* writes that he found his gas-bags leak, but could not detect the points at which the gases escaped. At last he filled the bags with water, and suspended them. He then found that the material of which the bags were made gradually became wet all over, showing that the leakage was general. Either those bags had worn very evenly or they were made of poor stuff to begin with.

At the meeting of the Linnæan Society, on May 1st, Mr. Sherring exhibited a series of excellent photographs which he had taken near Falmouth, and which showed the effects of climatic influence on the growth of several subtropical and rare plants cultivated in the open air.

It is reported that the Benchers are about to remove or rebuild, or do something in the iconoclastic style, to the fine old gateway of Lincoln's Inn. The *Athenæum* says that "the Inn is unfortunately rich just at present, and Lord Grimthorpe, having pretty well destroyed everything of historical interest at St. Albans, is longing to destroy some other relic of the past, and display his incompetence as an amateur architect." Well, we trust that some "amateur" photographers will see that a good record of the gateway is ("negatively") preserved.

A small committee of those most interested in the work of Alfred Stevens are about to issue a volume (Autotype Company) which will contain about sixty photographs of his principal works. Mr. Holford has given facilities for photographing the chief works by Stevens at Dorchester House; and the Marquise de Santurce, the drawing-room of whose house in Kensington Palace Gardens contains ten fine figure-paintings by Alfred Stevens, has been equally courteous.

The *Graphic* for May 10th contains an illustration of a group of slave girls recently captured at Cairo. The picture is from "a negative of a photograph" sent to England by the English matron of the home to which the girls were brought. This voucher for the truth doubles one's interest in examining the illustration.

On April 26th, a fine poplar standing near the village of Playford, in Suffolk, was struck by lightning, and portions of the branches, bark, etc., were spread over a space of two acres! The tree was "completely barked all round, with one half literally riven into fibre, leaving the other half of the trunk a whitened stem, still standing as a forty-feet shaft to be seen a mile away." We trust that some photographic records of this effect of electricity have been, or will be, secured. We believe the spot is not far from Ipswich.

The Smithsonian Institution has had two plates prepared, containing nine photographs of the total eclipse of the sun on the 1st of January, 1889, and distributed them among astronomers.

F. G. S.

Notes from the Liverpool Centre.

(By our District Editor.)

A BREAK in the weather rather interfered with the out-door excursion arranged for in this meridian last Saturday. Still, both the Wallasey Society and the Formby Society turned out, and their errand was not fruitless. Each contingent visited the Manchester Ship Canal works at Eastham, but here they were interfered with by the resident authorities of the Canal works, who strongly objected to the photographer and all his belongings. A special permit had been secured from head-quarters in Cottonopolis to "inspect" the Canal works, but it was contended that "inspect" did not mean or include "photograph;" in fact, orders had been given that photographers were to be warned off. It would puzzle half-a-dozen Philadelphian lawyers to explain how cameras and lenses can injure the great waste of earth and masonry in question; but in future prospecting photographic parties who intend operating on the Ship Canal will do well to remember last Saturday's objections.

The Liverpool exhibits, shown first at the Crystal Palace and afterwards at Newcastle-on-Tyne, are expected home this week, and will be hung for inspection in the Liverpool Association's rooms, Lord Street. The subject for practical demonstration last night, Wednesday, was "Silver Printing and Toning," by Mr. H. H. Williams. Applications for space in the exhibition next year are, I hear, very numerous. Mr. Paul Lange, at the late Golf Tournament, Hoylake, Cheshire, got ten excellent pictures of several of the leading players "in action." During last week the results were seen by several hundred golfers, who pronounced them the finest yet produced. Certainly Mr. Lange was most successful with his "lightning" shots.

Lancaster Photographic Society.—The late "lantern night" was attended by upwards of sixty members and friends. Mr. H. L. Storey presided, and announced the nomination of six new members. Fifty-six slides made on Alpha lantern plates, lent by the Britannia Works Company, Ilford, and slides by members and friends were shown by Mr. J. W. Pickard. Mr. H. J. J. Thompson and Mr. S. Fawcett brought slides made from negatives taken with the Kodak camera; Mr. Ransome, views of Lancaster taken thirty years ago by the collodio-albumen dry-plates and calotype or paper negatives. Messrs. Jumeaux and Dargue also contributed. As a whole, the assortment of slides was excellent; technical work, very good. A "Field Day" is to be held on Whit Monday, when it is hoped that the Lancaster and Kendal Societies will go out in company.

Walton Photographic Society.—On Wednesday, the 7th inst., the Society held their ordinary monthly meeting, the President, Mr. H. E. Burn, in the chair. Messrs. Charles Henry Bennett and M. Mawer were elected to membership. Subsequently Mr. Frank Vaughan's paper, "Photo-zincography," was attentively listened to and his demonstrations closely followed. At the next meeting, on June 4th, an exhibition of hand-cameras, with a discussion thereon, is to take place. At this exhibition Messrs. G. Latimer and Sharrock, both members of the Walton Society, will show hand-cameras of their own invention. I am given to understand that each apparatus is very ingenious.

The Liverpool University College Photographic Society is resting for the next four months. The members are photographers more as a matter of science and research than of pleasure. They have done valuable technical work since the organisation came into being. Dr. C. A. Kohn, the President, is uncommonly clever and experienced.

ADDRESS WANTED.—Will "Q," in "Answers and Queries," please forward us his address, as we have letters for him?

THE "FACILE" CAMERA.—In our notice we quite neglected to draw attention to the fact that the new sheaths are the invention of Mr. Frank Miall, and that he has secured them by Royal Letters Patent. Mr. Miall has spent much time in the perfecting of these sheaths, and it is only fair that he should have the credit due to him.

EXHIBITION OF THE GUILDFORD ART ASSOCIATION.—Mr. T. W. Brownrigg writes us, and says that "in your report it is stated one of the exhibitors was favourably commended, but while it is mentioned that I am exhibitor, the fact that I got first prize, the silver medal, is omitted, and also that Mr. Wainwright got the bronze medal."

A NEW SOCIETY.—Mr. Isaac Cohen, of 26, Wendover Road, Harlesden, N.W., writes us:—"I am desirous of forming a photographic society for Harlesden and district, and should be glad to know of any gentlemen who would communicate with me and assist in forming the same. I should be pleased if you will give this publicity in your next issue."

Birmingham Photographic Society.

A MEETING of the above Society was held in the Club-room at the Colonnade Hotel, New Street, on Thursday evening, May 8th; Alderman J. B. Stone, J.P., F.L.S., F.G.S., in the chair. There was a large attendance of members. Eight new members were elected. A letter from the Secretary of the Camera Club was read, enclosing a copy of their new rules for exhibitions. The Curator of the Municipal Art Gallery (Mr. Whitworth Wallis) sent a communication acknowledging the receipt of the National Challenge Cup (won by the Birmingham Society at the Crystal Palace Photographic Exhibition in March last), and asking for examples of the pictures which won the cup, to be exhibited with it in the Art Gallery. A vote of thanks was passed to Dr. P. H. Emerson for a copy of his valuable work on "East Anglian Life," which he had presented to the Society's library.

THE PHOTOGRAPHIC SURVEY OF WARWICKSHIRE.

At the close of the ordinary business, Mr. Stone announced that the meeting had been called especially to discuss the proposed photographic survey of Warwickshire. He said—

"We are assembled here upon a matter of very considerable interest, which has now reached a point when it is important to ask your very serious consideration as to what course is to be pursued. I take it for granted that every member of this Society is deeply interested in this proposed photographic county survey. Every one, I suppose, desires its success; every one also, I apprehend, is fully alive to the fact that there are difficulties to be overcome. If everyone is prepared to render assistance to get rid of these difficulties, depend upon it they will easily melt away; if we were to give way to the difficulties of the world, we should never accomplish anything. Reverting to my first observation as to its being a critical moment in the proceedings, you are called upon to-night to decide whether this survey shall be a success or otherwise. There are two distinct ways in which you can deal with the matter; one is by taking it in hand yourselves, and setting to work out the whole problem, taking credit for the result of your labours, keeping the control of the whole undertaking, and carrying it out within your own limits. That you are perfectly justified in doing, if you so desire. If you take this view, it will be your duty to set about a scheme within your own means and within your own numbers. This, of course, is simply within the range of any society; in other words, any society has a perfect right—indeed, you may go further and say that any single individual has a perfect right, who can command means, of doing within his own scope something towards obtaining the same object that you have in view. As a society you may succeed more or less, but such proceedings within yourselves, would not be sufficiently large, I apprehend, to correspond with the scale you have already contemplated.

"You have at this moment an opportunity to distinguish yourselves as a Society, because you have hit upon a brilliant idea which all the world is prepared to give you credit for; and that idea worked out will be not only for your good reputation, but will be a beneficial example to the whole country. If you take a good lead you will be followed by others, and if you take a narrow view, and you permit jealousies to exist amongst yourselves or in respect to other people, you will damage the whole thing, you will earn a bad reputation, and in point of fact you might make yourselves ridiculous. If you can decide upon broader lines, which I recommend, you will at once offer to the whole world a good idea, and appeal to the co-operation of everyone interested in it to contribute towards its success. For this you must go outside your own Society.

"It appears to me that if you do (and I hope you will) you will obtain considerable support, pecuniary and otherwise, from the county generally. You must present to the public a broad scheme that will invite confidence and that will attract support.

"You cannot propose any kind of council or committee limited to yourselves; you must begin by proposing a representative council for the photographic survey, and must state frankly that you are prepared to send representative members, and to render every assistance. There would be, of course, elected representatives from other districts and other societies; and I suggest also co-optative members, useful to you in many ways, and men sufficiently known to ensure the confidence of the city of Birmingham and the county generally. Then depend upon it

your projects will succeed, and you may almost believe that your scheme is an accomplished fact."

Mr. W. Jerome Harrison, F.G.S. (Vice-President), said he had listened with great pleasure to the very able speech made by Mr. Alderman Stone, with which he was in the main agreed. Their President advocated the establishment of a County Council or Committee, by which the photographic survey of Warwickshire should be directed; and, considering that there were several photographic as well as many scientific, artistic, and literary societies in the county, he agreed that such a guiding body was desirable. Such a Council should consist of representatives of all the societies willing to promote the work of the photographic survey. It was not less the duty than the right of each society to aid in carrying out and completing so desirable a task. But he (Mr. Harrison) did not think that it was necessary that their own Birmingham Society should sink their identity with the task they had resolved (at a previous meeting on December 11th) to undertake. The Council of the Birmingham Photographic Society had been carefully considering the question, and they had unanimously passed the following resolution:—"That it is desirable to form a Photographic Survey Section of the Birmingham Photographic Society, with separate officers and a separate subscription, to commence and carry out a photographic survey of Warwickshire." He trusted that the meeting would endorse that resolution, and that everyone in the room would join the Survey Section which it was proposed to form. The section could then invite the co-operation of other workers in the county, and form the county council to which Mr. Stone had alluded, by which the work to be done by each Society should be pointed out. As there would necessarily be certain expenses incurred, it would be needful to charge a small extra subscription to the section. He hoped they would also invite gentlemen to join the survey section who, though not photographers, felt an interest in the work, and for them the subscription should be somewhat higher. Such gentlemen could thus join the survey, and assist in its work, without becoming members of the photographic society. He trusted that the meeting would first discuss the resolution from the Council which had been read, recommending the establishment of a Photo-Survey Section of the Birmingham Photographic Society; after which the consideration of the county council, as urged by Mr. Stone, would naturally follow.

On the motion of Mr. B. Karleese, which was seconded by Mr. S. G. Mason, the resolution referred to by Mr. Harrison was carried unanimously and with much applause.

It was then resolved "That the subscription to the Photo-Survey Section shall be half-a-crown per annum for members of the Birmingham Photographic Society; and half-a-guinea per annum for all others."

Thirty-eight gentlemen then gave in their names as members of the new section.

The officers of the section were elected as follows:—Chairman, Mr. J. B. Stone; Vice-Chairman, Jethro Cossins, Esq.; Curator, Mr. B. Karleese; Treasurer, Mr. S. G. Mason; Hon. Secretaries, Messrs. J. H. Pickard and W. Jerome Harrison.

The question of a governing body to direct the general work of the survey was next considered. The following resolutions were then passed:—(1) "That the Council should consist of representatives elected by the various photographic and scientific societies of Warwickshire, with co-optative members who may be of service in developing or aiding the work of the survey."

(2) "That the photographic, artistic, scientific, and literary societies of Warwickshire be invited to send representatives to a general meeting on May 22nd at St. Edmund's College, Edmund Street, Birmingham, for the purpose of electing a Council to direct the Photographic Survey of Warwickshire."

It was decided that the members of the Birmingham Photographic Section should meet on Tuesday evenings at the Club Rooms, to discuss the work of the survey.

PHOTOGRAPHIC SOCIETY FOR CAMBRIDGE. — An adjourned meeting was held on the 7th inst., Mr. F. H. Sanderson in the chair. The rules as drafted by the *pro tem.* committee were discussed, and, with slight alterations, adopted. The election of officers then took place, with the following result:—President, Mr. F. Morley; Hon. Treasurer and Secretary, Mr. F. E. Brown; Committee, Messrs. F. H. Sanderson, S. S. Beall, G. H. Potts, and D. Greenwood. It was decided that the Association should be called the Cambridge Camera Club, and that persons joining on or before the 1st June will be exempt from entrance fees.

Register of Dark-Rooms, 1890.

THE following "Dark-Rooms" have been placed at our disposal.

We class them in four divisions, *i.e.*, *a* amateur, *d* dealer or professional, *h* hotel, and *s* photographic society.

In our letter of introduction full particulars are given as to owner, address, charges (if any); plates, chemicals, etc., kept by dealers; terms for temporary membership of societies; hotels; distance from station, etc., etc.

Every application for letter of introduction must be accompanied by SIX PENNY STAMPS. The owner of "Dark-Room" will be advised by same post as the applicant.

Societies' Meetings.

NOTE.—In this column the Editor can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editor will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BELFAST CAMERA CLUB.—On Saturday, the 10th inst., the members went to Lisburn, and from thence proceeded to Dunmurry, via the beautiful Hillhall Road. Many plates were exposed.

BIRKENHEAD PHOT. ASSOC.—The ordinary monthly meeting of this Association was held in the Hamilton Rooms, Price Street, on Thursday the 8th May, the President, P. H. Phillips, Esq., in the chair. A vote of thanks was proposed to Dr. Emerson for his "Pictures of East Anglian Life." Mr. W. Faltin exhibited Anshutz's tripod for hand-cameras, which was much admired. Mr. H. E. Burn, the President of the Walton Photographic Association, delivered a paper on "Daylight and its Variations." Mr. Burn drew attention to the fact that while records were being kept, by meteorologists and others, of the rainfall, the wind pressure, the pressure of the atmosphere, etc., no notice was taken at all of the amount of light from the sun, without which existence would be impossible.

Some scientists, he stated, did endeavour to arrive at an estimate of the heat evolved daily, in a very crude manner by the use of a burning glass, but as to the actinic property of the light, the property which is of such vital importance to the photographer, and which is of such variableness, no record is kept, and little or no attention paid to it. In suggesting the desirability of keeping a record of the variations in the actinic property of light, and the comparing of results of investigations in different parts of the country or world, he dealt at some length with the difficulties attending the fixing of a satisfactory standard, and stated that such could only be arrived at by the co-operation of scientific students, who would, with a perfected actinometer, at some convocation fix on a unit upon which to base their calculations. Mr. Burn, in the course of his remarks, described several actinometers, pointing out the errors and deficiencies which were too obvious even in the most perfect. The annual out-door competition takes place at Bidston on the 31st instant; meeting place, Bidston Church gates at 3 o'clock.

BRAMLEY AND DISTRICT PHOT. SOC.—This Society held its monthly meeting on the 6th inst. The Rev. S. W. Cope, M.A., was unanimously elected President. A syllabus for the year's work was formulated. An excursion was arranged to take place on Saturday, June 7th, to Ingleton. The next meeting, Tuesday, June 3rd, will be occupied by the exhibition of work done during the Whitsuntide holidays, and by a talk on "Exposure," led by Mr. J. W. Nicholson, of Rodley. The Society decided to institute a public album for the exhibition of members' pictures. Several new members were added to the Society, and it was intimated that several ladies were about to join. Members showed negatives and corresponding prints on the set subject ("Childhood"). The Society's room being near to Kirkstall Abbey (one mile), tourists visiting this place during the season will be heartily welcomed at the Society's meetings.

BRECHIN PHOT. ASSOC.—The ordinary monthly meeting was held on the 7th inst., Dr. Anderson, Vice-President, in the chair. Mr. Davis Ferrier, F.C.S., President of the Montrose Association, gave a lecture and demonstration of "The Autotype Process." Mr. Ferrier, in his lecture, first enumerated the various patents which had been taken out for the working of this process, and the purchase of these by the Autotype Company. Several sheets of tissue, previously exposed, were developed and mounted before the audience. A print previously mounted by double transfer was stripped. The whole of the experiments turned out very successfully and gave great pleasure to a pretty large audience. The demonstration was followed with the keenest interest, and was highly appreciated by all, this method of printing being new to most of the members. The lecture was illustrated by samples of the various tissues kindly sent down by the Autotype Company. These included specimens of fine art reproductions, which were very much admired. The Secretary intimated that he had received from Dr. Emerson a copy of his "Pictures of East Anglian Life." Mr. Ferrier also, on the motion of the Chairman, received the thanks of the meeting, and a number of the members on the spot arranged to order a supply of carbon tissue, the best thanks the lecturer could receive.

BRIXTON AND CLAPHAM CAMERA CLUB.—The usual fortnightly meeting was held at 35, Bedford Road, Clapham, on Friday, 9th inst. A letter was read from the Hon. Secretary of the Toronto Amateur Photographic Association (Canada), proposing an exchange of lantern slides, etc., later on in the year; and in response it was decided, after discussion, to devote part of the summer to preparing negatives for a set of slides illustrating objects and places of interest in and around London. The remainder of the evening was occupied in inspecting the handsome volume recently presented to the Society by Dr. P. H. Emerson. The excursion to Greenwich was postponed to the 17th inst., members to meet on the promenade above the pier at 3 p.m.

CROYDON CAMERA CLUB.—On the 3rd of May the Hon. Secretary, favoured by magnificent weather, conducted a party of members on an excursion to Wickham Court. Some fifty plates were exposed. The ordinary meeting at the Public Hall, Croydon, was held on the 6th inst. Some additions to the rules were approved. Steps were taken to form a technical library, and members and others invited to contribute books. Several members present offered books. Arrangements were made to hold elementary demonstrations on exposure, development, and printing, for the benefit of beginners. The first batch of six members were to meet on Wednesday, 14th, when Mr. White will

show and explain the process of development (Beach's formula). Members, or would-be members, can, on writing to the Assistant Secretary, Mr. A. Underhill, 23a, Clarendon Road, join the second batch of students, who will begin work in about a week's time. The election of members was next proceeded with. The President announced that he had much pleasure in proposing that Mr. Charles W. Hastings be elected honorary life member of the Society, for the valuable help given to Mr. Maclean in founding the Society, and since it has been established. The President explained that but for the AMATEUR PHOTOGRAPHER many gentlemen would not have heard of the efforts which had been made to form their club. The proposition was seconded and carried unanimously.

DEWSBURY AM. PHOT. SOC.—The monthly meeting was held on the 8th inst., Mr. J. Taylor in the chair. The Secretary laid on the table a presentation copy of Dr. Emerson's work entitled "Pictures of East Anglian Life." The evening was spent in discussing photographic topics.

HACKNEY PHOT. SOC.—The annual meeting was held on the 8th inst., when the following gentlemen were elected officers for the next session: President, Dr. Gerard Smith; Vice-Presidents, Dr. W. Ambrose Kibbler, Dr. Roland Smith, J. Hubert; Treasurer, Frank Jolly; Curator, A. Dean; Secretary, W. Fenton Jones (12, King Edward Road, Hackney); Council, H. Burton, H. J. Beasley, W. L. Barker, J. O. Grant, F. Houghton, and Dr. White. A satisfactory report and balance-sheet was read and adopted. It is pleasing to note that the membership of this young Society (established in May last year) is just on the century. The Society meets in Morley Hall, and various elementary papers are promised during the ensuing season.

HOLBORN CAMERA CLUB.—A meeting was held on the 9th inst. at the club. The President, Mr. T. C. Hepworth, F.C.S., delivered a lecture, illustrated by lantern slides, on photography as applied to the illustrated journalism of the day, as exemplified by the *Daily Graphic*. Messrs. E. Thorpe and W. R. Ramsay were proposed as members. A vote of thanks was proposed to Dr. Emerson for his gift of "Pictures of East Anglian Life." On Saturday ten members proceeded to Carshalton and Beddington. To-day (Friday) Mr. Cobb will give instruction to beginners on silver printing, toning, and mounting. Beginners in photography are specially invited to come.

LEWES PHOTOGRAPHIC SOCIETY.—The meeting was held on the 6th inst. The "business" part of the proceedings consisted of arranging a suitable date to meet the members of the Hastings Photographic Society, it being decided to fix it for Wednesday, June 4th, as being most agreeable to the majority of members of both societies. A vote of thanks was passed to Dr. P. H. Emerson for a handsome gift to the Society of a copy of his work on "Pictures of East Anglian Life." Mr. J. J. Hollway then proceeded to read his paper on "Cloud Photography," and handled his subject in a most entertaining manner. Mr. Hollway exhibited specimens of his own cloud photographs, and by this means showed how greatly the general effect of a photograph could be improved by the judicious introduction of clouds. He also explained how artificial cloud negatives could be manufactured, and the best means of printing them into the pictures. The paper was listened to with great attention, and a cordial vote of thanks was passed to Mr. Hollway for his kindness in preparing and delivering it.

LEYTONSTONE AND EPPING FOREST PHOT. SOC.—The second monthly meeting was held on the 7th inst., the Rev. J. Bradford presiding. After business, Mr. C. E. Webber read a paper on "The Platinotype and Carbon Processes," and developed several prints produced by each method. The Secretary announced the receipt of Dr. Emerson's book, "Pictures of East Anglian Life."

NORTH LONDON PHOT. SOC.—The ordinary meeting was held on May 6th; Mr. Groundwater in the chair. The Secretary reported that Dr. Emerson had presented to the Society through Mr. Fox, the late Secretary, a copy of his book, "Pictures of East Anglian Life." A copy of "The Year-book of Photography" for 1890 was also presented to the Society by the publishers. This being a technical evening, Mr. F. W. Hart exhibited his new portable stand for flash-lamps, photographic backgrounds, magic-lantern screens, etc. It is constructed of bamboo canes, screw jointed, so as to enable the operator to arrange the stand for any desired height or width. The standards are supported on tripod bases; these are made specially firm and rigid by braces, so firm that it seems almost impossible to overturn the structure. The whole of the frame-work and fittings when packed can be

easily carried with one hand by a lad. Mr. Hart placed a few lamps on the stand to illustrate the various motions, and stated that such a stand as shown would accommodate from thirty to forty lamps. A discussion afterwards took place, in which many members joined, and it was generally agreed that the stand was a novel invention, and likely to prove most useful both in flash-light and ordinary photography, and for many other educational purposes. Mr. Parfitt then exhibited a new hand-camera, which he had patented, and described its various parts and actions. Mr. Dando, an old member of the Society, exhibited some splendid negatives of views in Paris, including "The Eiffel Tower," both half-plate and stereoscopic, and also some beautifully printed platinotype pictures with cloud effects, from the negatives. A vote of thanks was passed to the Chairman, and the Secretary announced that the next meeting, on May 20th, would be the last lantern night of the season, when members were requested to bring as many new slides as possible. Mr. Parfitt in the chair.

PETERBORO PHOT. SOC.:—At the monthly meeting held on the 5th inst., a copy of Dr. Emerson's "Pictures of East Anglian Life" was kindly presented by him to the Society. It was arranged that the Society should, as far as possible, make a local survey of objects of interest, especially those in the domain of archæology. A local competition for instantaneous work was also proposed, and an excursion arranged for Whit Monday. Several members also showed specimens of their recent work.

SHEFFIELD PHOT. SOC.:—The monthly meeting of this Society was held on the 6th inst. Mr. J. W. Charlesworth gave a very lucid and interesting paper—subject, "Hand Camera Work." He began by describing a hand-camera made by himself, and showing the most minute details of the same. There were also laid on the table hand-cameras by Swinden and Earp, the Griffiths guinea camera, the quarter-plate Kodak and the original Kodak, two by T. G. Hibbert, viz., Turnbull's and Rouch's; also the Demon, a toy. It was announced that Mr. Chadwick, of Manchester, had promised to give a subject at an early date. A copy of Dr. Emerson's book, "Pictures in East Anglia," given by the doctor towards the library, was on view.

STAFFS, POTTERIES AM. PHOT. SOC.:—The ordinary monthly meeting was held on the 6th inst. The work done by members was shown and criticised, after which Messrs. Powell and Porter, who had exposed plates previous to the meeting, developed them, explaining their modes of development. On the 8th the members visited Trentham, and exposed a number of plates.

WEST SURREY AM. PHOT. SOC.:—On Wednesday, May 7th, Mr. Davison gave an address on "Platinotype Printing Processes," accompanied by a demonstration. Mr. W. Winsford occupied the

chair. Several new members were nominated. The attendance was large, about fifty being present. Mr. Davison having recited the advantages of the processes, and given briefly the theory of the formation of the platinum image, explained the distinction between the hot-bath, cold-bath, and printing-out methods respectively, and proceeded to develop a large number of proofs showing the ordinary details of practice as well as the variations in colour obtainable by the use of the sepia papers, and by the addition of mercuric chloride ($\frac{1}{2}$ drm. to 1 drm. per ounce of hot oxalate solution) to the developer. Cold-bath prints were also developed, specimens of all the variations being handed round upon glass plates, as also mounted examples of platinum prints on fabrics, rough papers, etc. It was decided that the next out-door meeting of the Society should be to Carshalton and district, and that the subject for the first Wednesday in June, evening meeting, be "Gelatin-Chloride Emulsion Papers." Mr. James agreed to treat this subject.

WOLVERHAMPTON AM. PHOT. SOC.:—At the usual monthly meeting of the above Society held on the 6th inst., Mr. G. Phoenix read a paper on "Art in Photography," which was illustrated by some two or three dozen transparencies showing the contrast between the "raw" and the "polished materials." The lecture was most instructive. The President (Mr. T. Ironmonger), in a lengthy and eulogistic speech, proposed a hearty vote of thanks to the lecturer. This was seconded by Major Hay, and carried with acclamation.

WORCESTER AM. PHOT. SOC.:—The first excursion of the Society took place on the 6th inst., under the leadership of Mr. T. J. Hobson. Mrs. Isaacs, of Boughton, near Worcester, kindly placed the whole of her beautiful park and gardens at the disposal of the members, and many plates were exposed.

YORK PHOT. SOC.:—A good number of members were present on May 6th, when after the preliminary business Mr. F. G. Benson read a paper on "Exposure," a full report of which will appear in the REPORTER. At the conclusion of his paper he exhibited a number of very beautiful views, to practically illustrate the principles he had been setting forth. Mr. G. Pawson since the last meeting has been awarded a silver medal for the best "Interior," by the proprietors of the Camera. This being the third medal won by members of the society in a very few months, a vote of congratulation was passed to the three gentlemen (Messrs. Pawson, Benson, and Ogden) who by their efforts had brought honour to themselves and credit to the society. A vote of thanks was accorded to Dr. P. H. Emerson for the gift of "Pictures of East Anglian Life." Communications from the Camera Club, and the Yorkshire Naturalists' Union with regard to geological photographs were considered.

To Correspondents.

THE insertion of **QUERIES and ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3797. **Vignette.**—What colour material makes best vignetting background? Could any amateur oblige?—FOURTH CENTURY.

3798. **Background.**—The yard in which I take photographs has four whitewashed walls, looking rather strange behind a pretty face. Could any

brother suggest anything cheap that would make a suitable background? If it entailed a little labour it would not matter.—PRISON YARD.

3799. **Fixed Focus.**—I use a 10½ in. focus lens. How must I adjust it so that all things beyond a certain distance shall be in focus, for hand-camera purposes? What would that distance be?—PUZZLED.

3800. **Lens.**—My lens is of 4 in. focus, and the stops are marked 4.9, 7.35, 9.8, 19.6, 39.2, 78.4. Will Mr. Davidson or some other reader kindly inform me what are their focal equivalents, and what their relative exposures are?—VENGEANCE.

3801. **Platinotype.**—Can any brother amateur kindly tell me where I can get platinotype and bromide papers in Spain made by English companies, as I always have to send to England for them? Also please state prices, etc.—T. K.

3802. **Exposure.**—Would you kindly tell me where I can get "The Practical Index of Photographic Exposures," by A. R. Wormald, and how much would it cost? Also what is the equivalent exposure in Spain for 5 secs. in England?—T. K.

3803. **Jersey.**—Can any brother amateur recommend Jersey to spend a week at? Also give places of interest, etc., and where Ilford plates can be purchased?—SEYJER.

3804. **Lens for Hand-Camera.**—Wishing to use my 5 by 4 Optimus R.R. lens for hand-camera, in what way can I focus from the outside? Can anyone give me scale?—M. R.

3805. **Whole-Plate Lens.**—My lens is half-plate, 8 in. focus R.R. By unscrewing the front lens, could it be made to cover a whole-plate, using the back lens only?—MISTOG.

3806. **Isochromatic Plate.**—Will some amateur brother send me a portrait or landscape taken on an isochromatic plate, as I should like to see one before buying plates? I will return picture and pay postage. Address with Editor.—WILLIAM ARMITAGE.

3807. **Quinol (Ilford Formula).**—The other day I made two bottles of the Ilford hydroquinone de-

veloper, and a week after, having occasion to develop a few plates, I found out that it absolutely refused to act. Could any other amateur inform me if he has had a like experience, and what is the cause? I have not met with this in other quinol developers.—PHILOS.

3808. **Norway.**—I am visiting western Norway this summer, and shall be glad to hear best parts to visit, exposure, etc.? Also, particularly, if the late daylight prevents changing plates in bedroom at night, and best means of packing plates to avoid breakage when luggage is strapped at back of carriages and other similar conveyances? I am taking hand-camera, and a gross of quarter-plates.—KERRY HEWLAN.

3809. **Diaphragms.**—Can anyone kindly inform me if I can buy a set of diaphragms for a lens, and where? If not, could I make them myself, as I have a lens which is almost useless without them? Any hints would oblige.—RUDIMENTS.

3810. **Photometer.**—How can I make a photometer on the same principle and style as Decoudun's?—MILLY W.

3811. **Plate-Rocker.**—How can I make a cheap and efficient plate-rocker?—MILLY W.

3812. **Lens.**—Will some one tell me what lens to have for all-round work, as I am greatly in want of one?—MILLY W.

3813. **Dark Slides.**—Will any brother photographer oblige me with the use of some of Tylar's metal dark slides, quarter-plate, for use on Whit Monday? Please write to me, stating terms, as early as possible. Address with Editor.—W. ULPH.

3814. **Stereoscopic Effect.**—If the images from a pair of stereoscopic lantern slides were thrown alternately for very short periods on a screen, would the effect be stereoscopic?—W. E.

3815. **Basket Work Camera Cases.**—Can any of your readers tell me where these are to be got, and how they compare in weight, durability, and cost, with the solid leather cases?—MUWA.

3816. **Lantern Slides in India.**—I am taking an optical lantern back to India with me. Can anyone

tell me whether slides can be hired in Bombay, and whether the charge for hiring is much higher than in England?—R. V. G.

3817. **Developers.**—Will hydroquinone and carbonate potash alone make a developer, and, if so, what are best proportions? Also the same, but with washing soda only?—M. U. T.

3818. **Films.**—How much washing do these need after fixing, and what is the best way to do it? as the plate-rack washers do not seem suitable.—M. U. T.

3819. **Brighton.**—Any hints respecting Brighton would greatly oblige. Have not been for many years, and am going shortly with camera. Could undisturbed use of dark-room be obtained one hour a day for a fortnight?—J. G.

3820. **Platinic Chloride.**—In issue April 25th, 1890, of AMATEUR PHOTOGRAPHER I see toning with platinic chloride is as easy as with the platinum salt. Mr. F. Perrins says, "Add to a slightly acidulated solution of platinic chloride a crystal of sodium sulphite, brush over a well washed silver print on plain paper to bring about the immediate displacement of silver by the platinum." Will someone kindly tell me what would be the effect on silver albumen paper?—H. F. LINGING.

3821. **Watch Camera.**—Can anyone recommend Lancaster's watch camera as being reliable and practical? Are the dark slides light-tight and well made?—ORSE READ.

3822. **Luggage Carrier.**—Would some cyclist and photographer kindly tell me where I could get a luggage carrier for Safety bicycle to carry whole-plate camera, etc.? Full particulars and probable cost would oblige.—HERCULES.

3823. **Elkonogen.**—Will a reader kindly give me a formula of the above that will give results equal to pyro?—A. C.

3824. **Toning.**—Will someone kindly say why, when I add the gold to the sulphocyanide of ammonium solution for Obernetter paper, a yellow precipitate is formed? I have tried adding chalk to the gold, but all to no purpose.—PUZZLED.

3825. **Backed Plates.**—Where can I buy plates ready backed for taking interiors?—FATHER PHIM.

3826. **Enlarging.**—I wish to enlarge from quarter-plate negatives (up to, say, 12 by 10) with limelight lantern. Would any brother amateur please say how I should proceed? What book can be recommended on this subject?—ARLINE.

QUERIES UNANSWERED.

21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3612, 3613, 3614.

28th.—Nos. 3634, 3636, 3637, 3638, 3640, 3641, 3643, 3653.

[April 4th.—Nos. 3661, 3664, 3674, 3677.

11th.—No. 3694.

18th.—Nos. 3703, 3708, 3718.

26th.—Nos. 3727, 3731, 3735, 3736, 3742, 3744, 3747.

May 2nd.—Nos. 3758, 3767.

9th.—Nos. 3788, 3790, 3793, 3795.

ANSWERS.

3530. **Elkonogen and Quinol.**—Have never tried this developer myself, but have heard it highly spoken of. It is said to combine the speed of elkonogen together with the sustaining energy of quinol. You will be pretty safe in trying it.—H. LEACH.

3531. **Reducer for Bromide Prints.**—Don't bother reducing bromide prints, but make a fresh print. The results after reducing are never so satisfactory as otherwise, and the paper, etc., is cheap enough.—H. LEACH.

3566. **Toning, etc.**—Splendid tones are produced by this bath. I should fancy that the prints would be even more permanent than others if anything.—H. LEACH.

3601. **Lantern Slides.**—Messrs. Thomas and Co. recommend the following for their plates:—

Alum	...	...	...	3	ozs.
Ferrous sulphate	...	...	...	2	"
Citric acid	...	...	...	3	ozs.
Water	...	...	...	20	ozs.

You might also try the Ilford formula. I prefer the ordinary ferrous-oxalate developer to any other. Carbonate of soda and hot water will clean the cover glasses very well.—H. LEACH.

3610. **ColloTYPE.**—The subject is far too extensive to treat of in these columns. Get Burton's "Photo-Mechanical Printing" and read up the process. I am afraid you will not be able to practice it satisfactorily at home.—H. LEACH.

3620. **Ventilating.**—Make two or three tin tubes of this shape, Z, and fix them in the wall of your room. Paint them dead-black inside. The tubes should be about two or three inches in diameter. This form of ventilator is both cheap and efficient.—H. LEACH.

3629. **Clark's Platinum Process.**—This process is rather more expensive than ordinary gold toning, but the superiority of your resulting prints will amply repay you.—H. LEACH.

3630. **Iron Precipitate.**—I should think that this

would be owing to excess of ferrous sulphate being present. It will not do any harm.—H. LEACH.

3633. **Shutter.**—The Thornton-Pickard time and instantaneous is one of the best shutters out, and you will never regret purchasing it. Messrs. Underwood's new shutter, the Instantolux, is a capital made instrument, very efficient, and moderate in price. If you get it, it will be sure to satisfy you.—H. LEACH.

3650. **Taylor and Hobson's Lenses.**—This firm make capital instruments, and your selection would be a very judicious one, as you would be able to do any kind of work that would ever come within your scope. They will work all right with the camera you mention.—H. LEACH.

3652. **Alum.**—Alum and chrome alum are used for same purposes. Solution of chrome preferred. Colour non-actinic, and easily distinguished from other clear solutions.—ALBERT DAVID.

3709. **Musty Album.**—Scent it with lavender water, or try any other perfume.—H. LEACH.

3711. **Copying.**—Place print in a good diffused light (near a window is suitable); stop down to f/32, and give 30 seconds. It would be better to unframe the print.—H. LEACH.

3715. **Silver Solutions.**—Your old solutions will be no good for sensitising albumenised paper. A solution of nitrate of silver, 50 grs. to the ounce, is used for that purpose. Float the paper for two or three minutes on this solution, and then hang up to dry.—H. LEACH.

3752. **Exposure.**—A difficult question to answer, but probably about two seconds with f/22, and about one with f/16.—H. LEACH.

3753. **Saloon of Ship.**—I am afraid that you could not do this with success.—H. LEACH.

3754. **Hand-Camera in an Exhibition.**—If you use a large stop and a very rapid plate, you might manage to get some sort of negative. If you could give a time exposure, you would manage it all right.—H. LEACH.

3759. **Isle of Man.**—Give about a quarter less exposure for the interior of the island than given in Wormald's tables. At midday, sunlight, in Douglas Bay, you could give one-fortieth of a second with f/10.—H. LEACH.

3760. **Focus of Lens.**—With f/10, probably about 19½ yards. Rule: "Multiply 2·7 by the square of the focal length, and by the fraction expressing the diameter of the diaphragm aperture." It would be an easy matter to test the lens.—H. LEACH.

3765. **Adapting Camera.**—It is difficult to understand what you mean. If you want to know whether you can fix a half-plate dark-slide to a quarter-plate camera, most certainly not. Another time please be more explicit.—H. LEACH.

3772. **Scratches on Burnisher.**—I fancy it is the inferior quality of the bar that makes it so liable to scratches. Of course you lubricate your prints with castile soap and spirits. See that there is no dust on them. Grind some fine emery into a paste with oil, and repolish the bar with it.—H. LEACH.

3773. **Instalments.**—Messrs. Goy, 21, Leadenhall St., London are the only firm who let you have photographic apparatus by instalments that I know of. It is better to buy your apparatus outright.—H. LEACH.

3774. **Development of Instantaneous Printing.**—See page 614 of the "British Journal Almanac" for a good method of developing instantaneous exposures.—H. LEACH.

3775. **Glass for Dark-Room.**—I should scarcely advise you to work in the light you mention. I, however, often work in a light filtered through what is known as canary medium, and have found it quite safe.—H. LEACH.

3776. **Demon.**—This camera is properly named, being only a snare and delusion to everybody.—FRED DAVIS.

3778. **Demon.**—It is a very interesting toy; well worth the money.—SUNLIGHT.

3779. **Demon.**—A mere toy, made to sell. What more can be expected?—H. LEACH.

3777. **The Camunilux.**—A very ridiculous question. See my answer to 3776.—H. LEACH.

3778. **Dark-Room Gas Lamp.**—I have found Perken and Rayment's lamps for gas or oil excellent. Choose a large one, with a flashed orange glass and canary screen. The light is brilliant, and perfectly safe for all plates, except isochromatics, which require the substitution of a sheet of dark-ruby glass for the above.—E. F. C.

3775. **Dark-Room Gas Lamp.**—The Optimus is the best in the market, and is a really splendid article.—H. LEACH.

3779. **Labels.**—Varnish with copal varnish.—H. LEACH.

3779. **Labels.**—Varnish over your labels with any ordinary transparent varnish; they will never come off then.—W. A. J. CROKE.

3780. **Weymouth.**—If "G. P. W." would call at Smith's Supply Stores on coming to Weymouth, he would get all information required, also can there get plates, paper, or anything required at same price as in London.—AMATEUR.

3781. **Tone.**—I must apologise to "Stillingfleet" for my grave error in my answer to his query re tone. The formula should have been:

Hypo	...	...	...	2	ozs.
Chloride of gold...	...	...	...	3	grs.
Water, to	...	...	...	10	ozs.

The reason I recommend this bath for Aristo pape is to enable him to get the tone he requires, which other baths, I think, will not give, as they tone to purples, while this ranges from yellow to brown.—Q.

3782. **Burnishing.**—Mount your prints in the ordinary way with starch, and when they are quite dry rub a little dry Castile soap over them, which apply with a tuft of cotton wool. The sooner they are burnished after mounting, the better. Then run them through the burnisher in the ordinary way, once or twice.—W. A. J. CROKE.

3782. **Burnishing.**—The prints should be dry, and mounted. Dissolve 5 grs. of castile soap and smear over print, and allow to dry. The bar should just be hot enough to be held comfortably in the hand. When once in the burnisher, the print must be passed right through without stopping, otherwise lines will appear on the print.—H. LEACH.

3782. **Burnishing.**—The prints must be allowed to dry after mounting. Castile soap, applied dry by rubbing a piece of flannel on it and then over the print before passing through the burnisher, is as good as anything. The surface obtained depends on the temperature of the bar, and the number of times the print is drawn over it. The heat is about right when ascertained in the same manner as a laundress tests a flat iron.—E. F. C.

3783. **Havre.**—I crossed to Havre last summer, taking with me a large stock of plates. I had no difficulty at all at the Custom House at Havre, nor on my return at Southampton. I should advise "Terwalk" to cross over to Trouville. There are steamers every day, generally two. There is plenty of food for the camera on the beach and in the harbour. I was there at the beginning of July, and found very short exposures were required.—F. M. G.

3784. **Clark's Platinum Process.**—A pinch or two of sodium carbonate to, say, a pint of water will suffice to neutralise any acidity carried over from the toning bath.—E. F. C.

3785. **Hypo.**—The solubility of hypo is 1 in 1·5 of cold water; consequently two-thirds of an ounce of hypo will form one ounce of saturated solution.—H. LEACH.

3785. **Hypo.**—Each 1 oz. of saturated solution of above will contain 7 drms. of dry hypo.—FRED DAVIS.

3785. **Hypo.**—About ¾ oz. I put about 12 ozs. hypo into 20 ozs. water. When it is all dissolved, the solution will measure about 25 ozs. For use, take 1½ ozs. saturated solution, and add 1½ ozs. of water. The strength will then be 1 to 5.—SUNLIGHT.

3786. **Carbonate of Soda.**—About 1 oz.—SUNLIGHT.

3786. **Carbonate of Soda.**—Here the object of the sodium carbonate is to neutralise the acidity that exists in most ready sensitised papers. A teaspoonful to two pints of water will suffice, or ½ oz. saturated solution. The proportion need not be very exact.—E. F. C.

3786. **Carbonate of Soda.**—I use 60 grs. of carbonate of soda to 1 pint of water, keeping the prints in this solution for about five minutes.—GUM TREE (Rome).

3787. **Stirn's Secret Camera.**—I develop in a cheese plate. Out of twenty-four exposures I have obtained about two good negatives. To trim, procure from a turner's a metal disc of suitable size, hold print against same, and trim. Apply to Hockins—see advertisement AMATEUR PHOTOGRAPHER.—FRED DAVIS.

3787. **Stirn's Secret Camera.**—I cut the plates in half, and develop them in a half-plate dish with pyro-ammonia. You will have to practice a good deal with the camera before you can turn out good negatives. You will have no difficulty in cutting the prints out if you use a shape and a swivel wheel trimmer. Everything requisite for these cameras can be obtained at Perken, Son, and Rayment's.—SUNLIGHT.

3789. **Instantaneous Lens and Shutter.**—A rapid rectilinear lens by a reputable maker, and a Newman's shutter.—SUNLIGHT.

3791. **Toning.**—Most probably result is due to using stale paper. Get a fresh lot. Durand's is very good.—FRED DAVIS.

3791. **Toning.**—I have found the following give a purple tone: Wash the prints slightly, and then put them in a solution of 1 oz. of washing soda to a gallon of water for 5 minutes, give a final wash, and tone with acetate. See Burton's "Modern Photography," page 113.—A. H. M. GREENHILL.

3791. **Toning.**—Print a fair depth. Put prints in water, "having two dishes," so as to remove when changing water. About six changes required. You will see if the water is clear, when place them in a bath, 1 pint water, about 2 teaspoonfuls bi-car. soda; remain 5 minutes. Follow with toning. Try and get bath between 70 or 80, having your toning dish in a larger vessel, the latter containing hot water. Tone required depth, place then in bath, 1 pint water, 1 oz. common salt, 3 drops ammonia '880; heat between 70 and 80; remain 5 minutes. Now hypo 2 ozs., 1 pint cold; 10 or 15 minutes. Rinse; then place in cold water; remain 20 hours, or less; few hours extra will do no harm. Water changed about three times. Finish up by placing in hot

water for 5 minutes. If remaining till water is cold, lessen the first time. Should be purple tone fit for mounting after burnishing or enamelling, etc. Note—keep your fingers clean.—PETER PIPER.

3792. **Silver Prints Reducing in Toning.**—After toning, place prints in bath—1 oz. salt, 1 pint water, 3 ammonia—for about 5 or 10 minutes. Perhaps you do not print deep enough, or tone too far, with the salt water bath. The hypo does little or none as to taking out colour.—PETER PIPER.

3793. **Silver Prints Reducing in Toning.**—Most probably your toning bath is acid. Do you try it with litmus paper?—FRED DAVIS.

3792. **Silver Prints, Reducing in Toning.**—Over-print a little, as most toning baths reduce a little, which must be allowed for.—H. LEACH.

3794. **Hiring.**—If "Anxious" will write to me, I will send him a circular of a place where he can get a camera and lens on the "hire system," where he will be well treated. I got a £5 5s. camera there on the above terms, and paid 10s. a month for it, and got it at the ordinary catalogue price, and could not have been dealt with more fairly. I can strongly recommend this to "Anxious."—BATTEN (address with Editor).

3795. **Lens.**—The best kind of lens for all-round work is a rapid rectilinear. Focal lengths vary with make. Get an Optimus R.R., 9 by 7, f/12, price 82s. 6d., and you will be satisfied.—H. LEACH.

3796. **Lens.**—A rapid rectilinear, focal length 11 inches, for whole-plate.—SUNLIGHT.

3796. **Lens.**—The lens known as a rapid rectilinear or doublet, consisting of two combinations, is the best for all-round work. Unless it is required to photograph architecture in cramped situations, the focal length should not be less than the longest side of the plate used; say, $1\frac{1}{4}$ or $1\frac{1}{2}$ times.—E. F. C.

EDITORIAL

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

C. DODMAN.—See our rule at the head of this column. The lens you name is a good all-round one, and works at f/8.

THERMO.—You cannot expect to do everything with a hand-camera. The lens you propose is an excellent instrument, but whether it will do all you require is a question. We think it most improbable that you will be satisfied with any focussing arrangement to the camera you name, the lens is, we think, of fixed focus. The sheaths could not be used we think. You know that we do not name apparatus, but cannot at all endorse your idea of taking parts from two or three hand-cameras, and thinking to make a workable whole. The lens you have selected is one of the best in the market for the purpose, and equal to either A, B, or C. What do you want more if the lens you have "gives excellent definition," the shutter fitted to the camera is quick, and you say of the whole: "It cannot be beaten for combined portability, efficiency, and convenience." Why change? Of those you name we consider D the best "hideable" or detective camera, and F the most serviceable hand-camera. Glad to hear you date from No. 1. Hope you may be a subscriber for many years.

H. BUTLER.—We should advise C. The lens you name, working at f/8, will answer your purpose admirably. You cannot do better than to try plates 3 and 4. We should recommend you to try the cheap series of No. 4.

C. H. GREEN.—We have registered your name and address, and will communicate with you shortly.

CAFE NOIR.—You will not do better than have the shutter B; we have been much pleased with it. The action of A is good, but it has not as many good points as B. We shall be delighted to see any subscriber from the "sister isle," and shall be pleased to have an opportunity of inspecting photographs of "Old Dublin." Entry Form "Travelling Studentship" has been sent you.

LANDSDOWNE PLACE.—For cheapness, reliability, and efficiency we place the hand-camera No. 1 first. No. 4 is a very useful instrument, and has a most perfect shutter. No. 6 is a good camera, and is worth seeing, if you will go to the price. No. 2 is useful if you want a handy camera for packing, and one that can be really used without being noticed. We have no knowledge of No. 7. The lens No. 8 is not equal to the other you name.

E. W. BREWERTON.—We very much regret that the makers of the camera you name have never had the courtesy to comply with our request to send us one of their cameras for inspection, although they know all such apparatus is returned within fourteen days; under these circumstances we cannot advise you to purchase the instrument. It is our rule

never to give advice about apparatus unless we have had an opportunity of examining it.

WALTER N. GREENWELL.—Do we understand you, you want English stamps that have been used? Many thanks for use of dark-room.

R. MURRAY.—We shall be pleased to use your MS. later on, and will send you a proof.

H. H. SEALY.—Should we require the negative we will write you; many thanks for your kind expressions.

J. M. BUTLER.—Our "Visitors' days" are Mondays from 2 to 5 p.m., and Thursdays from 11 a.m. to 1 p.m.

MRS. MOUNSEY.—Shall hope to see your work in the Ladies' Competition.

RUDIMENTS.—Certainly.

W. H. ARMITAGE.—No. 1: Read our rules. No. 2: Do you mean a transparency or a reversal of the image? You should take care to dust your plates before using; the holes are probably due to your not having done so.

H. H. G.—You are to be congratulated upon your work. In Nos. 1 and 2 the shadows are rather too deep; No. 3 is very excellent, and the lighting perfect. No. 4: the foreground is weak, and the lighting poor. No. 5 is slightly stained. No. 6 slightly lacks definition, especially in the mid-distance. We admire very much Nos. 3 and 6, and from them we feel satisfied that we shall soon find you in the front ranks of artist photographers.

AMATEUR.—If you require a first-class camera, either A or B; if a cheap one, nothing can beat H. In lenses we should advise J or L. The lens O would be best for you with camera H.

JAMES FURNIVAL.—Should advise you to have A or D; perhaps the latter will best suit your purpose.

A. D. W.—We should advise you to have an R.R. lens. The A lens is, we believe, fitted to the camera you name. If so, we have seen very good work done with it, although we have not used it ourselves.

JOHN PRICE.—If you only want to work with a fixed focus we should advise No. 1; if with adjustable focus, you will find No. 4 a very excellent instrument, and with it we should advise lens No. 1 or 4. The shutter in No. 2 camera is very good, but it is the best part of it. The focussing screen can only be used in No. 3. This camera is exceedingly compact, but it is expensive, and we have heard of the shutter being not satisfactory. The plates you name have the reputation for being thickly coated, and should give you density if properly handled.

H. LEACH.—Very good of you; accept our grateful thanks. Plates in the following order: G, F, E, I, A, K. We do not care for the rest; L are good, but stand alone.

LEWON.—We think A would best suit your purpose; neither of the others would be likely to stand the climate so well; they are more complicated, and it would be difficult in such a country as Burmah to get them repaired. A is simplicity itself. There are few films that can be thoroughly relied upon, the fault rather of the coating than of the makers of celluloid. In the B camera the shutter is the best, but with the A all can be done that is required. We should not advise you to rely upon 1 and 2; we should certainly advise O.

J. G. L.—Will write you shortly. If you want a first-class camera, either 3, 4, or 5. Really one is as good as another; we work a 4, and find it very serviceable.

MARIE DE MEUDON.—You had better have the camera you name, and will be able to do very fair work with the lens mentioned.

TAPO.—Cannot advise you upon the lens. Try it, and let us know the result. You should have no difficulty in obtaining purple tones. Try 15 grs. of gold chloride, and the concentrated solution of sulpho-cyanide. Your son is a clever fellow, and we hope soon to see some more of his work.

P. L.—We like the No. 2 shutter best. For special purposes certainly, but not for ordinary landscape. Use matt surface, Obernetter or Aristotype.

BEGINNER.—You should have no difficulty in securing the bright surface if you queuee on to glass, provided you are careful in mounting. We should recommend you to mount dry with glue thinned with methylated spirits.

J. S. TELFER.—You had better buy "Platinum Toning" (Clark). The varnishing of negatives is not absolutely necessary, but with care can easily be accomplished.

H. A. S.—We would have gladly published your letter had you sent your name as well as address.

MUWA.—We insert your query, as we cannot help you; they are both good shutters. But we rather favour B.

M. N. T.—Thank you very much for the suggestions, some of which we will adopt short.

F. MALL.—The paragraph inserted will, no doubt, meet your wishes.

SHUTTER.—We very much like No. 1, and No. 4 is a good shutter. The firm you name have acquired all the patents.

E. C. L.—No. 1: Certainly. No. 2: Nothing since. No. 3: The ordinary, in our opinion.

C. EMANUEL.—On Monday afternoon or Thursday morning (but not next Thursday).

W. BATTEN.—Why do you reply to query twice over? Send us the name and address; we are often asked the question.

R. W. SENIOR.—We will write you shortly; the hand-camera proved to be a very ordinary camera of American manufacture.

ZINCO.—Your question shall be sent to Professor W. K. Burton, who is resident in Tokio, Japan, therefore it will not be answered for some months.

AUSTRALIA.—No name or address, consequently your question is held over.

ENQUIRER.—We cannot advise you to do business with either firm. We think not.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or we do, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer."—AMATEUR PHOTOGRAPHER, vols. viii., ix., x. (one short), 77 numbers, clean; offers wanted. — Hutchinson, 87, Chorlton Road, Manchester.

Stripping Films.—Stripping films, four (48) spoils, whole-plate, 15s. each; ditto quarter-plate, 4s.—Rev. A. B. Whatton, 58, Warwick Gardens, Kensington.

WANTED.

Camera, etc.—Camera and lenses. 5 by 4 camera, dark-slides, lenses by good makers; state full particulars and price; approval.—W. Ray, Science School, Kidderminster.

Lancaster's 1889 Instantograph, half-plate, complete, in exchange for violin outfit.—Full particulars to George Packer, Porth, nr. Pontypridd, Glamorgan.

Camera Case.—Good half-plate camera case.—Description, with inside dimensions and lowest cash price, to G. W. Stephens, South Bank, R.S.O.

Dark-Slides.—To purchase, three half-plate double dark-slides, to fit Lancaster's 1888 Instantograph.—Apply, James Cottingham, 22, Station Row, Parkgate, Rawmarsh.

Hand-Camera.—Hand-camera, quarter-plate Facile or Ideal, latest pattern, perfect condition; approval.—Gardner, Eaglesbush, Neath.

Rouch's Eureka hand-camera; approval; deposit.—Particulars to Bartrop, 1, Albion Road, Clapham, S.W.

Lenses.—To hire, quarter W.A.R. lens for week; give 2s. 6d.; purchase if cheap.—Browne, Photographer, Margate.

Dallmeyer's half-plate wide-angle rectilinear lens, cheap; must be in good condition.—Bremner, 129, St. Mark's Road, North Kensington.

Quarter-plate Lancaster's Silver-ring Rectigraph lens; will give bluish-white electric pocket battery and appliances, quite unsoiled, cost £2.—E. Hill, 2, Wandle Villas, Wandle Road, Wandsworth Common.

Ross' or Dallmeyer's 10 by 8 or 8 by 6 R.R. lens; would exchange a valuable working model locomotive, 30 ins. in length, tubular boiler, two cylinders, each 1½ in. bore, and all usual accessories; full particulars on application; worth £25. Or a beautiful rook rifle, 300 bore, in leather case, with everything complete; cost £9, and has never been used; is quite new.—Dr. Collins, East Grinstead.

A Wray R.R. lens, 8 by 5, Iris diaphragm, in good order.—James Johnston, 17, Hamilton Drive, Hillhead, Glasgow.

Lens, etc.—Half-plate R.R. lens, by good maker, two double dark-slides, and tripod, cheap for cash; approval.—Ritchie, 7, Frederick Street, Edinburgh.

Lancaster's 10 by 8 instantaneous lens and shutter, in exchange for Optimus rapid rectilinear, 7 by 5, or offers.—T. Close, Heaton, Lancaster.

Negatives.—Good quarter-plate view negatives.—Particulars to X., 22, Northam Road, Southampton.

Photographs.—Half-plate photographs of English or Scottish ancient domestic architecture, in exchange for ecclesiastical or domestic ditto; lists sent; platotypes preferred.—W. Anderson, 40, Warwick Gardens, London, W.

Printing Frames.—Half-plate printing frames, in exchange for fishing rod, or gentlemen's gold ring; value 5s. each.—Sutcliffe, 12, Thorn Street, Burnley.

Sets.—Half-plate Watson's Acme Tourist camera, swing-back, Optimus R.R. landscape lens, and Thornton-Pickard time shutter; approval; deposit.—Carnegie, Eastleigh House, Eastleigh, South Hants.

Half-plate long extension camera, slides, and tripod.—Full particulars and price to Phillips, 19, Saxon Road, South Norwood.

Tripod.—Good sliding tripod, to suit half-plate camera.—Metcalfe, Rodley, Leeds.

PLEASURE CRUISES to the LAND of the MIDNIGHT SUN.—The ORIENT COMPANY'S steamships GARONNE (3,876 tons) and CHIMBORAZO (3,847 tons) will make a series of TRIPS to NORWAY during the season, visiting the finest fiords. The dates of departure from London will be as follows, and from Leith two days later:—
June 4th, for 15 days | July 15th, for 15 days
June 18th, for 27 days | July 23rd, for 27 days
June 25th, for 15 days | Aug. 8th, for 21 days
The steamers will be navigated through the "Inner lead"—i.e., inside the fringe of islands off the coast of Norway—thus securing smooth water; those of the 18th June and 23rd July will proceed to the North Cape, where the sun may be seen above the horizon at midnight. The Garonne and Chimborazo are fitted with electric light, hot and cold baths, etc. Cuisine of the highest order.

Dark Room provided for the use of Photographers. Managers, F. Green and Co., 13, Fenchurch Avenue; Anderson, Anderson, and Co., 5, Fenchurch Avenue, London, E.C. For further particulars apply to the latter firm, or to the West End Agents, Grindlay and Co., 55, Parliament Street, S.W.

✿ OUR VIEWS. ✿

To hold as 'twere the mirror up to nature."—*Shakespeare.*

It will be remembered that the Liverpool Amateur Photographic Association were made the custodians of the "Boston Set" of lantern slides, prepared by the members of the Boston (U.S.A.) Camera Club, which have been so much admired by members of societies and their friends in the United Kingdom. The Club have now sent a second consignment of lantern slides, and lecture, "The White Mountains," prepared by members, with prints and texts mounted, and seventy slides in a box. They are presented to the Liverpool Association, who will lend them for exhibition next winter. Early application is desirable, and the executive of the Boston Club particularly request that "Societies using the slides will mail any Press notices that may appear in the local papers."

* * * *

We have been asked to prepare exchange sets for Toronto and New York, and shall be pleased to receive not more than six slides from any lady or gentleman, to be included in the sets. We shall, in return, be able to loan the "sets" which are being prepared on the other side for us, and will be placed in our charge for loaning to societies and others next winter. A short description should accompany each slide. Places of historical note, celebrated houses, cathedrals, views in the chief touring districts, seaside resorts, studies of peasant life in England, Scotland, and Ireland, pictures of animal life, sporting, etc., will be acceptable. It is proposed to classify the slides under the following headings:—

Landscape and Seascape.
River Scenery; Architecture.
Figure Studies; Animals.

The "sets" should be made up by the 1st of September. Any surplus over and above those sent to America and Canada will be added to our loan sets here. We shall hope to have a better organisation next winter, and would suggest that early application for lantern slides be made. We shall keep the sets under the general headings enumerated above, and shall make them up in lots of 50, 100, and

150 slides, with lists giving titles, and in many cases short notes.

* * * *

At the *Conversazione* of the Royal Society given on the 14th inst., photography was the subject that most impressed the brilliant company assembled. Mr. Isaac Roberts, F.R.A.S., showed a plate about six inches square, a picture of three degrees of area on the heavens, upon which may be counted 20,000 stars; all of these the eye unaided has never seen. By exposing the same plate at different dates minute changes appear to be traceable; so that future astronomers may compare their records with these, and possibly get some light as to the real scattering of worlds in the province of the universe to which we belong. Professor Norman Lockyer, in the same way, has photographed the spectra of nebulae, and finds confirmatory evidence of his theory of the meteoric origin of suns. Mr. C. V. Boys and Professor Lodge have employed the camera and sensitive plate to take pictures of falling drops of water, the operation occupying the 800th part of a second.

* * * *

A SUBSCRIBER sends a silver print which "has been done over nine years." It has not lost a trace of tone, and is as bright and clear as the day it came out of the print washer. He says, "In my opinion the secret of getting permanent silver prints lies in using freshly sensitised paper, and thoroughly fixing the print in an alkaline hypo bath, to finish quickly, thoroughly washing the print in plenty of water." No better advice could possibly be given, and we hope first that workers will see that they get *fresh* paper, and secondly, that they will carry out the operations as carefully as our subscriber.

* * * *

THE subject of the permanency of prints brings to our remembrance a few remarks made by a gentleman of our acquaintance, whose grandfather, nearly ninety years of age, was recently photographed in the style of the day, "large, direct head, untouched." The photograph was a

LADIES' COMPETITION.—All photographs must be received by Saturday, May 31st, 1890.

good one, the features well delineated, each particular hair there, but, unfortunately, the fixing and washing were neglected, and the print is fading so fast that in a short time it will be of no value whatever. Much is said about the value of photography as a permanent record. If photographers will *deceive* the public for the sake of a gain of a few pence or the saving of an hour or two in the manipulatory processes, we are of opinion that they are unworthy of the confidence placed in them. In the case under consideration, the old gentleman cannot be expected to live many years, and his children, grand-children, relations, and friends are, of course, delighted to have his "photograph." But what mockery it is to sell them a thing that, notwithstanding all the advances and improvements in photography, does not remain a portrait for even a few years.

* * * *

WE note that a Camera Club has been formed in connection with the Birkenhead Y.M.C.A. Meetings are held on the first Monday in the month; Mr. Edward Whalley, an amateur worker of many years' experience, has been elected President; and Mr. J. C. Walker, Hon. Secretary, will give every information; his address is 42, Conway Street, Birkenhead.

* * * *

NEXT week we shall publish an article upon "Printing on Obernetter Paper," giving the most complete instructions for procedure.

* * * *

THE business of Messrs. Samuel Fry and Co., Limited, was offered at auction yesterday, the 22nd inst. At the time of going to press we do not, of course, know whether the property was sold. The plates and paper made by Messrs. Fry and Co. have obtained, deservedly, a very high reputation, and in enlarging work they could hardly be surpassed. We regret very much that it should have been necessary to wind up the concern. We understand that it is quite possible the business may be carried on.

* * * *

"OPTICAL TOURS," at the International Cyclorama Hall, 84, Oxford Street, W., are one of the sensations of the season; the programme is changed every week. The admission for one "tour" is 6d., two 1s. During the present week there is a "tour" of fifty pictures in North America and Niagara in Winter, and a "tour" in the Holy Land. Apart from being a successful entertainment for the sight-seer, these "tours" are most instructive to parents and their children. We venture to predict that they will be very largely attended.

* * * *

THE delightful summer trips on the river Thames in the steamboats plying from Oxford to Kingston will commence on Monday next. The boats leave Oxford and Kingston every Monday, Wednesday, and Friday for Henley, where they stay the night, leaving on Tuesday; Thursday, and Saturday for Kingston and Oxford. It is almost impossible to imagine for the amateur photographer a more delightful two days' holiday, given fine weather. Through the courtesy of Mr. Salter, we shall hope in the course of a week or so to make the trip, and will then give "Our Views" upon the matter more fully. In the mean-

time we are sure that those who have not "done" the Thames will be delighted.

* * * *

WE have been honoured by a visit from the distinguished member of the Vienna Photographic Society, Herr Carl Ulrich, who advises us that it is the intention of the Society to hold a "Photographic Salon" in April of next year. The Council of the Society will, we understand, invite exhibitors. Further particulars will be announced in these columns. The Council are very anxious to secure the best photographic work.

* * * *

WE are asked by the Managers, to announce that all the medals awarded at the recent Crystal Palace Photographic Exhibition have been sent to prize winners.

* * * *

CHEAP journalism is the rage of the day, and photography is utilised in many ways, but *Short Cuts* (a halfpenny paper) is the first, to our knowledge, to start a "Great Photographic Competition." They are offering Mawson and Swan's "Popular Set," value £7 16s. 6d., for the best short answer to the question, "What are the best uses to which photography can be applied?" The conditions of the competition are of course to be found in *Short Cuts*, which, by the way, is a most excellent weekly journal, admirably printed on good paper, and containing most instructive and entertaining matter. To our mind it is a most marvellous production for one halfpenny.

* * * *

WE would again draw attention to the fact that Fellows of the Royal Geographical Society are desired to forward copies of any photographs they may have taken during their travels, to the Map Curator of the Society, by whom they will be acknowledged. Should the donor have purchased the photographs, he is requested to give the name and address of the photographer, for purposes of reference. The object of the society is to add as much as possible to the collection of photographs which has been established in the map-room at their offices.

* * * *

NEXT week we shall give "our views" and the experiences of several of our subscribers on the system upon which Mr. F. D. Bulmer, of Dewsbury, does his business. We shall be pleased to hear from any of our readers who have done business with Mr. Bulmer, in order that we may give him every benefit possible in summing up the case.

* * * *

WE have received a long letter from a member of the C. T. C., really only covering the same ground as Mr. Shipton, so that we do not feel disposed to occupy our space by inserting it, especially as it is contributed under a *nom de plume*, with the exception of the concluding paragraph, which reads: "Finally I am bound to confess that I think that the C. T. C. has been brought before amateur photographers by your action, and I believe that the result will be that many will become members of that body for this reason. I am unwilling to think that many amateurs would try to induce hotel-keepers to break their legal contracts, when the same, and I may say treble, advantages are to be gained by joining the Cyclists' Touring Club for

the small payment of 2s. 6d. a year." We trust that Mr. Shipton will now be satisfied that though one of the first laws of our life is *self-advertisement*, by which means we have made the AMATEUR PHOTOGRAPHER and our other publications known all over the world, we are not above giving "bold advertisement" gratuitously to others.

* * * *

MONTHLY COMPETITION No. 12.

INSTANTANEOUS PHOTOGRAPHS, ANIMALS, ETC.

The prints sent in for this competition are of very unequal merit, but there has been no difficulty in finding photographs worthy of the first and second prize, and we have selected several for honourable mention.

The first prize, the AMATEUR PHOTOGRAPHER Silver Medal, with ribbon and clasp, has been awarded to

A. W. GOTTLIEB (Shrewsbury),

for his capital study of a dog sitting on a pedestal, which he entitles "Real or Imitation." The dog is exceedingly well depicted. The photograph was taken with a Dallmeyer 3 B lens working at full aperture, with an exposure of one-tenth of a second on an Ilford rapid plate. The dog, we understand, was exceedingly restless and nervous, so enhancing considerably the truthfulness of the picture.

The second prize, of a Bronze Medal with ribbon and clasp, has been awarded to

EVAN GRIFFITHS (St. Columb),

for an exceedingly carefully taken photograph of a flock of geese. This picture was taken with a Darlot's whole-plate R.R. lens on an Ilford ordinary, the exposure being a "quick cap." In the flock there are some fifteen geese, each one taken quite sharp, and without a sign of movement. They were evidently caught "at attention," and as an instantaneous picture the result is admirable.

We have chosen the following for honourable mention, and place Mr. J. O. Bury's "Alderney Bull" first. This picture is on Aristotype paper, which gives almost the same colour as the animal's skin, and, being a matt-surface, a soft velvety texture. The negative was taken with a Ross R.R., working at $f/16$, on Wratten and Wainwright's drop-shutter plate. In a note, Mr. Bury says, "Printing process, Aristotype paper, toned with chloro-platinite of potassium, squeegeed on ground glass. The exact colour of the animal is reproduced by this toning process."

Next in order we consider "Study of Swans at Weymouth," by Edgar F. Blow (a member of the Croydon Camera Club). This picture, which is very good, was taken by an Optimus R.R., working at full aperture, $f/8$, with an exposure of one-tenth of a second on an Ilford ordinary. Ordinary albumenised paper, toned with acetate of soda. The swans are all fairly sharp, but the plumage is not so well defined as in Mr. Griffiths' "Geese."

Mr. H. H. Hammond, of Southsea, sends a photograph of a "Gymnast in mid-air turning a somersault." This picture is very clever, but we note signs of touching out, though taken altogether it is certainly amongst the best of the kind we have seen. It was taken with a Ross R.S. with full aperture, a Caldwell's shutter and a XXXXX times Paget plate.

Mr. Alexander Thomson, of Paisley, contributes a photograph, "Feeding the Pups." This was taken with R. R. lens working at $f/8$, on a Thomas rapid plate. The print, which is not of good tone, is on Obernetter paper.

The next we call attention to is "Tossing the Caber at a Highland Gathering," by Mr. Francis G. Smart, Tunbridge Wells; this picture would have been improved if the author could have been nearer to the man in the act of "tossing the caber," and we must complain of the excess of foreground. It was taken with a Ross 10 by 8, working at $f/11.2$, on a Mawson plate.

Mr. Charles L. Mackley, Lake of Constance, has sent us a happily caught picture which he calls "An Intruder." Two cats are sitting by the window sill, and a young goat has jumped up, possibly "to ask a question." The pussies are in the act of resenting the intrusion. As a subject the picture is most interesting, but as a photograph it is not up to Mr. Mackley's contribution last month; he has used a Ross R.R., giving half-second exposure on a Carbutt's celluloid films.

Many of the other contributions, which are all acknowledged in another column, have very good points. We shall hope as the season advances to have a larger number of prints entered for our Monthly Competitions.

* * * *

THE ROYAL ACADEMY.—I.

It might be asked what right we photographers have to dare to criticise the works of presumably our best artists, of those who being privileged to exhibit at the Royal Academy are the present-day exponents of art principles and practice. To those who put to us such a question we have an answer to give; first, when we point to the pictures of such men as Sutcliffe among the professionals, and of many an amateur whose works are known to all students of the AMATEUR PHOTOGRAPHER, and frequenters of our exhibitions. Such men show very often high artistic excellence in a skilful and thoughtful manipulation of the weapons in the photographic armoury, and if our artists would take the trouble to study some of the best work achieved by photography, they would find that in some points where artistic skill is required in reproducing the truths of nature—and where are they not required?—they have something to learn which the most accurate drawing and the most technically perfect painting cannot teach them.

True, the art world is beginning to recognise that veritable artistic merit can be exhibited in a photograph, and while the iron is hot we photographers must strike it, and in season and out of season insist that much incorrectness in perspective and proportion, much false value in the massing of light and shade, much that is untrue in the attempt to render nature away from her actual presence, can be corrected by an appreciative use of photography; and further, we would see—and indeed we look forward to—the day when photography shall no longer be regarded as the slave of art, to be used, perhaps, and then thrown aside, but shall be recognised as a sister, if only as a foster-sister, of drawing and of painting, and occupy her own niche in the Temple of Art.

Whatever may be said about the nature of Art, whatever definition may be attempted, whatever may be the object in view, we maintain that a more or less truthful representation of nature is at the bottom of it all. Even the most confirmed idealist must acknowledge his debt to nature; he cannot paint his ideal gods and goddesses in human form, without the conception of some human form of nature's workmanship before the mind's eye, at least

The conception of all ideals must have their root in nature, even in such a picture as "Davy Jones's Locker" (No. 81), which Mr. Wyllie has given us this year, portraying a subject which the artist can hardly have seen in nature. Photography cannot produce the pure ideal of the soul, but it can give the idealist the basis thought of his conception; and for us who maintain that the more of nature and the less of the ideal a picture contains the nearer it approaches true art, photography is an engine of first-rate necessity, for photography "transcripts" nature, photography is hampered and hedged in by no hard-and-fast rules of the schools, has no traditions, and is as free in its method as the nature it seeks to portray.

After defending our position let us take a glance at the chief picture show of the year—the Royal Academy—a general view at first, because we hope on some future occasion to examine the pictures more in detail. There is one fault in the Exhibition, that recurs as regularly as the Royal Academy itself, namely, the excess of portraits. We were so struck with the oft-repeated occurrence of ladies in gorgeous gowns, of soldiers, of academical celebrities, and of ecclesiastical dignitaries, to say nothing of the children and the host of unknown nobodies the catalogue recorded, that we took the trouble to count all those canvases purporting to be portraits, and found that in a total of 1,172 pictures distributed throughout eleven rooms, no less than 186 came under that denomination, or, in other words, 16 per cent. of the pictures are portraits. Now that is not as it should be, and can only be attributed to the fact that art is too often pursued for the sake of the loaves and fishes rather than for its own sake, and that the Royal Academicians encourage this sordid element by hanging portraits, which in many cases, from an art point of view, have certainly no merit. Take 191 as an instance; it may be a good likeness, but the background of the most conventional old-fashioned studio pattern, and the whole pose, with its affectation and stiffness, stamps the work as labour wasted on a result which cannot but be characterised as a qualified failure.

There are, of course, notable exceptions, and there is many a portrait that is a grace to the Exhibition, *i.e.*, those of the Bishops of Chichester (197) and St. Albans (117), by Mr. Oulless, and more especially Mr. Richmond's portraits of both the late and present Bishops of Durham (166 and 124). We want someone to create an agitation against this excess of portraiture, just as that which the "British Matron" started against the nude; and, indeed, such an agitation is more called for, and should have as great an effect, if we may judge of that effect by the absence of the nude in this year's Academy—a matter, perhaps, in some respects to be regretted, for it is to be remembered that the nude *can* be painted with reserve and even with modesty, which fact is, indeed, manifested (with one exception) in such studies as are to be found this year at Burlington House. The President's pictures exhibit that studious care and accuracy with which he always renders the human form, whether clothed or unclothed, for he at least realises the necessity for studying from the nude even for an accomplished painter (the *Art Journal* publishes reproductions of his preliminary sketches for two of this year's pictures). "Solitude" (166) appears to us the most satisfactory of Sir F. Leighton's work this year. The figure is as full of grace as of poetry.

Perhaps the two greatest dramatic pictures are "The Redemption of Tannhäuser" (203), by Frank Dicksee, and the "Death of Cleopatra" (551), by Hon. John Collier, about which we hope to say something on a future occasion; they are both admirable in their special ways. "Whitehall" (216), representing the scene of the execution of King Charles I., whatever faults it may have, stirs up that righteous indignation which should find a place in every loyal Englishman's heart when he is reminded of this crime that stains the pages of our national history. Nor must we forget Sir John Gilbert's "Onward" (186), a marvellous conception full of warlike life.

The animal subjects are not very numerous. Mr. Trood, who also exhibits some good sketches of dog life at the Grosvenor, has a clever picture entitled, "Six to One on the Rabbit" (184), but we must leave it to the experts in instantaneous photography of animals to say whether the attitude of the foremost terrier is correct or not.

Besides the dramatic pictures mentioned above, there are many others which tell a story, and of these "The Sculptor" (270), by J. B. Burgess, and "Louis XI." (291), by Seymour Lucas, are full of feeling.

There is no sort of doubt that however much Continental art critics may insist upon the commonplaceness and mediocrity of English art, there is one branch in which we excel all the nations of the world, and, moreover, it is just that branch in which nature has to be most closely followed in order to attain success, and, therefore, in which artists can be most assisted by photography, namely, landscape and seascapes. We may readily grant to the French that we cannot produce a portrait painter to equal Bonat, or to the Germans that we have no one with the same originality of genius as some of their artists (though even if we had it is at least doubtful whether the latter would find a place on the walls of the Royal Academy), but to no nation will we yield our supremacy in landscape whilst Vicat Coles can produce such a picture as "The Meeting of the Thame and the Isis at Dorchester" (234), whilst Henry Moore can paint such a sea piece as "Summer Time, Channel Islands" (257), whilst we still have Leader with us (131, 458, 672), and whilst an artist not yet an Academician can send us such a really beautiful and truthful piece of work as "The White Mill" (43).

Sometimes even a good landscape is spoilt by striving after an effect which the artist thinks will improve his picture, but which his imagination, and not nature, provides him with. Witness No. 715, "A Bend in the Avon." The artist has painted in, on the waters of the river, a reflection of a red cliff which could only be in reality reflected on that part of the river's surface which is beyond the bend, and therefore out of the spectator's sight. But this is not the work of one of the great masters of landscape, and it is through them, and not through the lesser lights, that the Academy teaches us the most important lessons. We fearlessly challenge their criticism of our photographs from the point of view of art alone, and we maintain that if they find mediocrity amongst us, that is a fault we have in common with them; but that if they will deign to study our best works they will find much that is really excellent from which they may derive benefit, in the same way as we do from their masterpieces, and that from such peaceful rivalry and friendly criticism a true brotherhood in art may arise.

Register of Dark-Rooms, 1890.

THE following "Dark-Rooms" have been placed at our disposal.

We class them in four divisions, *i.e.*, *a* amateur, *d* dealer or professional, *h* hotel, and *s* photographic society.

In our letter of introduction full particulars are given as to owner, address, charges (if any); plates, chemicals, etc., kept by dealers; terms for temporary membership of societies; hotels; distance from station, etc., etc.

Every application for letter of introduction must be accompanied by SIX PENNY STAMPS. The owner of "Dark-Room" will be advised by same post as the applicant.

Letters to the Editor.

STEREOSCOPIC EFFECT ON THE SCREEN.

SIR,—To judge by the queries appearing from time to time in your columns, the accomplishment of the above object must possess considerable fascination for many of your readers, but from all I can gather of the subject we have yet to see an experiment carried to a successful issue.

The effect would doubtless be obtained by the projection of a pair of stereoscopic images side by side on the screen, and viewing them through a pair of suitable prisms to make the images coincide, but an arrangement on the following lines would give the required result from superimposed images.

Immediately in front of the lenses of a biunial lantern carrying a pair of stereoscopic slides, let there be fixed a circular disc of thin metal or vulcanite, and of sufficient diameter to little more than cover both lenses. Close to the edge, and at an angular distance of 72 degs., are five apertures, so that when the

disc is revolved first one image and then the other would be thrown on the screen, one picture being entirely cut off before the other begins to appear.

What is necessary now is an apparatus to hide the picture from first one eye and then the other; and the most feasible plan I can think of is as follows:—A strong and permanent rail is fixed across the room at a height of about four feet, and on the top of this rail are firmly secured by the edges two thin flat strips of well-seasoned wood, two inches wide, of the same length as the rail and with a space of about one-thirty-second of an inch left between. Every three feet or so a pair of one-inch view-holes are bored side by side through both strips, each pair being about three inches apart, and of the same level as the eye of the seated spectator. A light steel rod is carried on suitable bearings either on or under these strips, and this rod carries a number of light metal plates about four inches long. These plates work between the two wooden strips, so that when the steel rod is moved to and fro longitudinally the metal plates cover first one and then the other of each pair of holes exactly at the same time. The movement of the steel rod could be obtained by means of a small eccentric at one end and working on a light rotating shaft, which, by suitable gearing, would be connected with the disc at the lantern, and would revolve five times to the disc once.

Now if the disc at the lantern be made to revolve at a speed of 120 per minute each of the stereoscopic pictures would appear and disappear in turn ten times in one second, which, owing to the persistence of vision, would produce the same effect as the superimposition of one picture on the other, but, of course, not so brilliantly lighted; but by looking at the screen through a pair of "view-holes," the oscillating metal plates being properly adjusted, the pictures would be completely separated, each eye having a picture to itself, and the result would be perfectly stereoscopic.

The mechanical difficulties are considerable, but they are certainly not insurmountable, and if the synchronisation of the revolving disc at the lantern and the oscillating metal plates could be effected by electrical means instead of light toothed gearing, the great objection as to the permanency of the viewing apparatus would be disposed of.—Yours, etc., THE SMITH.

F. D. BULMER.

SIR,—In my opinion you are rendering a great service to amateur photographers generally in exposing such shady practices as those of F. D. Bulmer. Some little time ago this gentleman (?) replied to my advertisement in your Sale and Exchange columns, and accordingly a camera, etc., were sent to him on approval. In spite of repeated protests, the goods were detained between three and four weeks, and were only returned, piecemeal fashion and the *worse for wear*, under threat of legal proceedings. I enclose my card.—Yours, etc.,

ANOTHER VICTIM.

THE KODAK LENSES, ETC.

SIR,—In your last week's issue I notice that the Eastman Company take exception to certain statements of mine, anent the character and cost of camera lenses in general, and in particular of those of the first Kodak cameras. Mr. Walker affirms that the first or No. 1 Kodak lenses are "specially manufactured" and at "great cost." I accept the statement of Mr. Walker that the Company do pay more for their lenses, having no means of gain-saying so positive a statement, and, so far, amend my article; but this I repeat, that sufficiently deep meniscus or periscopic lenses, able to do very similar work to those of the Kodak, can be bought, not at the extravagant price of 6d. each, which I put them at, but at 3d. each. I may add, in conclusion, that if my remarks seemed to specialise the Eastman Company's cameras it was only by accident, as being, perhaps, the best known specimens of the class of cameras I was alluding to.

I would add, however, that I entirely agree with the views of "F. G. B.," "T. D.," and "S. E. K.," that the cost of hand-cameras is out of all reasonable proportion. In the cases of some few, of complicated and delicate mechanism, a justification for a certain enhanced price is, of course, obvious, but this only to a moderate extent, in view of the immense advances in mechanical appliances and tools, enabling cheap production, of the present day. Witness, for example, the price at which watches

can now be sold—silver, 25s., and even a trustworthy and admirable watch, in metal, can be bought of the Waltham Co. for 12s. Yet none of the existing cameras approach a watch in the complication and delicacy of their mechanism. I should add that exception for high cost might be allowed in the cases of the more complicated cameras, when the first cost is relatively high in order to reimburse the inventor's experimental outlay. Our hand-camera makers almost generally seem to have forgotten an old commercial saw which reflected on the superior profitability of the nimble sixpence over the slow shilling, and thus fostered the habit of amateurs of making investigations into camera construction, in order to make for themselves what is put on the market at prohibitive prices. Apologising for troubling you at this length, I am, yours, etc.,

F. T. NORRIS.

May 20th, 1890.

SIR,—With respect to the Kodak cameras and their lenses, will you allow me as an engineer to say a word?

One of the earliest I worked during an extensive tour in Italy last year, with a result of seventy good pictures in a hundred exposures. The mechanism I consider perfect. The outside finish is far above the European style, and the lens (for a photographic sketch-book) good.

I am now working one of Beck's quarter-plate hand-cameras, with its splendid lens and mechanism, with great satisfaction, but in addition shall try, for certain so-called "detective" work in Egypt, one of the Eastman Company's large Kodaks.—I am, Sir, yours, etc.,

H. CAMPBELL THOMPSON, Assoc. Mem. Inst. C.E.

May 15th, 1890.

DARK-ROOMS REGISTER.

SIR,—If the organising of dark-rooms, etc., is to be left to associations who from their very constitution are raised above the purely commercial element, then Mr. Shipton and his Cyclist Touring Club ought not to have a finger in the pie, for a more essentially commercial affair I do not know; even its own members and the cycling papers speak of it as the "C. T. C. shop."

Mr. Shipton carries his commercialism still further. He endeavours to use his position as Secretary to the C. T. C., and what he is pleased to consider his "position as a representative man in the amateur photographic world," to obtain from dealers and manufacturers reduced prices for the goods he needs for his personal use. His sneer, therefore, at the trade instincts which must of necessity be present in any undertaking not purely philanthropic is much out of place. Don't you see where the cloven hoof peeps out? The rule of his club, which he quotes, runs: "That he will charge the said reduced tariff only to the bona-fide members of the C. T. C." Now if you put your readers in the way of obtaining the use of dark-rooms without the help of the C. T. C., you rob that club of so many possible subscription fees, and here's where the shoe pinches.—Yours etc.,

JAN.

SIR,—I shall be spending three or four days at Whitsuntide in North Carnarvonshire, and I regret to see that neither Bangor, Carnarvon, nor Llanberis are mentioned in your list of dark-rooms.

I mention this as I think it possible that you may know of some one there, but have not yet had permission to print his name, and that very likely I may be of some use to you there, as well as myself benefiting by your institution.

Do you rely upon your subscribers giving you the names of those willing to provide the convenience?—I am, sir, yours, etc.,

May 20th, 1890.

F. HOPE-JONES

(Member of the Liverpool Soc., on the Council of the Birkenhead Soc.)

NOTE.—No dark-room is added to our register without the signed consent of the owner.—Ed. "AM. PHOT."

DISTRICT EDITORS.

SIR,—I have been considerably amused as a journalist by the letters on "District Editors." I, of course, am an amateur photographer, but must confess that I do not see the necessity for a reporter at a photographic meeting being a photographer. Pressmen have every day of their lives to report—and to report

intelligently and correctly—meetings of a technical kind, although they have no practical knowledge of the subject. There is, in my humble opinion, every reason why a journalist should be more impartial than most people, and that is because he diurnally has to give entirely unbiassed reports of public meetings. Take the reports of any respectable organ, and you will find that, whatever may be the case with leaders and other discursive articles, the reports are fair and accurate. I certainly think with "A President" that there might be some difficulty about the honorarium, but there is a still more knotty point—an "attached" Pressman has to hold himself in readiness to post off to a meeting for the paper to which he is reporter five nights out of six, and would not be permitted to enter into a contract to attend periodical gatherings for an outsider, because the meetings would clash. As for "unattached," they are of two classes—those who would "scorn the action" of taking on a job of so small and unremunerative a kind, and those who would not be worth employing.

It seems to me there are but two alternatives—one to employ amateur reporters, the other, somewhat too vast an undertaking to be entertained, viz., to keep a large staff of travelling reporters on the paper in which the reports are to appear.—Yours, etc.,

May 16th, 1890.

JOURNALIST.

SIR,—In answer to "Vice-President's" strictures, I am not "particularly affected," and the "shoe pinched" nowhere. I did not withdraw my name because I "cannot with fairness" represent my society. I have no inclination to bandy imputations with your correspondent, much as he deserves a *quid pro quo*, and, with your permission, will remain content to bring the correspondence to a conclusion by simply confirming my previous letter.—Yours, etc.,

A PRESIDENT.

* * * *

PHOTOGRAPHIC SURVEYS.

SIR,—Annexed I beg to hand you copy of letter sent this day to the Secretary of the Birmingham Society. *Vide* your report in last issue.—Yours faithfully,

May 19th, 1890.

CHAS. B. READER (Hon Sec.)

Birkenhead Photographic Association,
"Mountside," Rowson Street, New Brighton,
May 19th, 1890.

The Secretary, Birmingham Photographic Society.

Dear Sir,—I am requested to draw your attention to the fact that in claiming originality for the photographic survey of Warwickshire scheme, your Chairman (of the 8th inst.) does the above Association an injustice.

The Birkenhead Photographic Association was the first photographic association in the world to undertake work of this nature, and its survey of the Hundred of Wirral is now an accomplished fact, having been completed last year.

I trust you will seize every opportunity of correcting the false impression that may have been created.—Yours faithfully,

CHAS. B. READER (Hon. Sec.)

* * * *

LIGHT IN THE DARK-ROOM.

SIR,—The proof of the pudding is in the eating," and I never felt the truth of this old proverb so much as when I read Mr. C. J. Davies' letter in your edition of the 16th inst. I do not for one moment doubt the correctness of the chemical equations, nor would I dream for one moment of entering into an argument as to the correctness of anything contained in Captain Abney's "Treatise on Photography," but until Captain Abney or Mr. C. J. Davies can show me a negative which, after being developed, properly washed, and fixed in daylight (or sunlight, if preferred), shows signs of fog, either directly or after some years, I shall continue to fix my plates, etc., not in that "stuffy dark-room," but in actinic light, either directly after washing, or for some hours after, thus adding at least a little comfort to the work that has of necessity to be done (in most cases) in very close quarters. Mr. Davies did not see the necessity to comment on the danger incurred where the formation of a highly insoluble double hyposulphite of silver and sodium compound is permitted, but I think he ought to have done so and pointed out in what direction the danger tends to develop itself. If he is afraid of fog I can show him negatives absolutely clear; if he doubts the per-

manency, negatives taken years ago, all fixed in broad daylight, or I can refer him to letters in the AMATEUR PHOTOGRAPHER, 1887 and 1888 editions, by Messrs. W. A. J. Croke, Jas. Wood of Liverpool, T. B. March of Chiswick, J. Wall (Editor of the "Dictionary of Photography"), or J. Werge, of Berners Street, and many others. The last named gentleman was, I think, the first to discover, at any rate to publish, the fact that there is absolutely no danger in fixing plates in actinic light, provided they are well washed (see book by Jabez Hughes, revised and edited by J. Werge, published about ten years ago); and if Mr. Davies will call upon Mr. Werge he could see an example of such a negative. I hardly think the above-named gentlemen and scores of others ought to be styled "pseudo successful workers," until someone can come forward to prove their false doctrines.

Personally, it can make no difference to me what insoluble compound is formed by exposure to actinic light, so long as I know by experience (which is better than theory at all times) that the compound does not damage my negatives. There is a theory that tea is very injurious, but I know people of eighty who have been drinking it all their lives. Of course, if a man's digestion is bad, tea will not improve it, any more than fixing in actinic light will a plate that has not been washed free of the developer.—I am, yours truly,

B. DAVIDSON.

* * * *

THE AUTOMATIC PHOTOGRAPH COMPANY.

SIR,—As editor of a professional paper, you should ascertain better the facts before allowing yourself unfavourable comments upon anyone's name and character.

From the card I send you herewith, and from my letter which appeared in some financial papers, you will see that the prospectus of the Automatic Photograph Company, Limited, was correct. I have to add that not only all the photographs signed by the London Stereoscopic Company, and exhibited actually in the Regent Street portrait windows and reception rooms, but also 90 per cent. (if not 99 per cent.) of those which fill up the show-cases and frames of the Cheapside branch were executed under my hand and direction.

I expect to see the copy of this letter in your next issue, and a full apology for your remarks.—I remain, Sir, yours truly,

May 18th, 1890.

L. NIEVSKY.

NOTE:—We gladly insert the letter, which is in itself a full explanation.
—ED: AM: PHOT:

* * * *

THE BOSTON CAMERA CLUB LANTERN SLIDES.

SIR,—At the meeting of our Council this week, I was officially requested to lay before you the interesting work of our American friends, and to say that the "White Mountains" set, which is to be exhibited before our members on 29th inst., can be forwarded to any photographic association in the United Kingdom, for exhibition, on application to me.

I have now in my possession the synopsis of four sets (a copy of the first of which I sent you), viz.:

(1) "The White Mountains of New Hampshire," prepared in 1889 by members of the Boston Camera Club, now in our possession.

(2) "Glimpses of California," prepared by members of the Pacific Coast Amateur Photographers' Association, which we expect to be consigned to us this spring.

(3) "Chicago, Historical, Picturesque, Architectural," prepared by members of the Chicago Camera Club; a duplicate set of which is being made up to be ready for us early in 1891.

(4) "In and about San Francisco," prepared by members of the California Camera Club; a duplicate set also to be ready for next season's circuit.

Mr. Wm. Garrison Reed, the Hon. Sec. of Boston Camera Club, writes me that this work has grown to such magnitude that he has resigned his office, and expects to be appointed, at their next meeting, "Manager of the Interchange of Illustrated Subjects." He also states that another year they will be able to ship quite a number of interesting subjects, if their English brethren care enough for them by responding with a little of their own work.—Yours faithfully,

G. M. TUNSTALL.

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

(Continued from page 331.)

THERE are as many different kinds of atoms as there are different chemical elements. All the atoms of the same element are alike, but the atoms of different elements are different. They differ in their tendency to enter into chemical combination, or, in other words, in their chemical energy; and they differ also in their relative weights. All the atoms of hydrogen have the same weight, and all the atoms of oxygen have the same weight, but the weight of the atoms of oxygen is different from that of the atoms of hydrogen. The numbers which we call the combining weights of the elements represent the relative weights of their atoms. Notice especially the expression, *relative weights*. We do not know the absolute weight of an atom of hydrogen, or an atom of oxygen, or an atom of chlorine; what we believe we do know is that the atom of oxygen is 16 times as heavy, and the atom of chlorine 35.4 times as heavy, as the atom of hydrogen. Our knowledge on this point is of the same kind as when we know that one man is twice as old as another, without knowing whether one is twenty and the other forty, one twenty-five and the other fifty, or one forty and the other eighty.

Now since the atoms are indivisible in chemical reactions, it follows that combination must take place between entire atoms, and if the atoms have definite relative weights, combination must take place in definite proportions by weight. This is what actually happens, and the first law of chemical combination is a statement of the fact.

The simplest compound of which we can conceive is one composed of only two atoms of different kinds. If however the same two elements form more than one compound, these higher compounds must be formed by the addition of a certain number of *whole atoms* of one or the other element, and therefore the proportion of either element in any of the higher compounds must be a simple multiple of its proportion in the lowest compound. The law of multiple proportion is a statement of the fact that this is always found to be the case.

Turning to the examples previously given (p. 289), we see that the combining weights of the elements referred to, *i.e.*, the relative weights of their atoms, are as follows:

Chlorine	Mercury	Tin	Phosphorus
35.4	200	118	31

We believe that the molecule of the insoluble chloride of mercury is composed of one atom of mercury and one of chlorine, the molecule of the soluble chloride is composed of one atom of mercury and two atoms of chlorine; the solid chloride of tin is composed of one atom of tin and two atoms of chlorine, the liquid chloride of one atom of tin and four atoms of chlorine; the liquid chloride of phosphorus of one atom of phosphorus and three of chlorine, the solid chloride of one atom of phosphorus and five of chlorine.

The assumption that the elements consist of inconceivably minute particles or *atoms*, which remain undivided in chemical reactions and possess definite relative weights, enables us therefore to explain the results of experiments as expressed in the laws of chemical combination. We shall see later that the theory of molecules and atoms will also explain a great many other facts which have never been explained on any other supposition.

Since we are led to the conclusion that the combining weights of the elements are the relative weights of their atoms, these numbers are very frequently called the *atomic*

weights of the elements. Although the terms *combining weights* and *atomic weights* denote exactly the same set of numbers, they are not really synonymous. So long as we call these numbers combining weights we confine ourselves strictly to the results of our experiments; if we call them atomic weights, we assume that the atomic theory is true.

Indestructibility of Matter.—The experiments which have established the laws of combination and have enabled chemists to determine the combining weights, have also led to a conclusion of the very highest importance, namely, that, no matter how energetic the chemical reaction may be or how complete the alteration in the properties of the substances concerned, the total weight of the products is always exactly equal to the total weight of the original substances. Even in cases where a substance almost entirely disappears, as in the burning of coal or of a candle, the matter composing it has not been destroyed but has simply been converted into colourless and transparent, and therefore invisible, gases. In no chemical change is there any destruction of matter which previously existed, nor is there any creation of new matter. So far as observation and experiment can teach us, the total quantity of matter in the universe remains constant; we can change its form and its properties, but we cannot alter its amount. This great law, that *the total mass of matter in the universe remains constant whatever the changes in its forms and properties*, is known as the PRINCIPLE OF THE CONSERVATION OF MATTER.

Mixtures.—Hitherto we have divided matter into elements and compounds, but we frequently meet with substances which do not strictly belong to either class; they are not elements, for they can be resolved into simpler constituents, and on the other hand they differ in several important respects from true compounds.

EXPERIMENT 27.—Grind five part of fine iron filings with three parts of flowers of sulphur until they are mixed as perfectly as possible. *Observe* that the mixture has a colour intermediate between those of its constituents. Examine it under a microscope; *observe* that the particles of iron and sulphur can be distinguished from one another. Introduce a magnet into some of the mixture; *observe* that the iron adheres to the magnet, but the sulphur does not and can readily be removed by tapping the magnet; in this way the sulphur can be separated from the iron. Throw some of the powder into water; *observe* that the iron sinks, but the greater part of the sulphur floats on the surface of the water.

EXPERIMENT 28.—Place some of the same mixture in a dry test-tube, and heat to dull redness. *Observe* that heat is developed, and the contents of the tube become red hot, thus showing that a chemical change has taken place. When the tube has cooled, powder the product, and repeat with it the experiments made with the original mixture. *Observe* that the sulphur and iron cannot be distinguished under a microscope, they cannot be separated by means of a magnet, and they do not separate when thrown into water.

Here we have a typical instance of the difference between compounds and the third class of substances or *mixtures*. In Experiment 27 the sulphur and iron are merely mixed; in Experiment 28 they combine under the influence of heat and form a true compound.

The chief points in which mixtures differ from compounds are as follows: (1) their properties are the mean of the properties of their components; (2) their composition is variable, and the proportions of their constituents usually have no definite relation to their combining weights; (3) they are not homogeneous, and the different constituents can be distinguished under a microscope; (4) their constituents can be separated by purely mechanical means, such as throwing the mixture into a liquid in which some of its constituents

will float whilst others will sink, or treating the mixture with a solvent which will dissolve some of the constituents but not others.

(To be continued.)

Photographic Printing Processes. No. XI.

BY ANDREW PRINGLE.

Gromwell House, Berkeley Heath, Kent

BROMIDE PAPER PRINTING.

(Concluded.)

IN Chapter X. I gave formulæ for what may be called standard or normal developing solutions for bromide paper; we now proceed to discuss the methods of using our solutions, and other operations connected with this process. But first a few words on exposure may be useful. In my last chapter I pointed out the effects of varying exposure, but I have not yet discussed the radiant or the manner of making the exposure. If we are to achieve even results or to acquire facility in varying our exposures to suit our purposes or to overcome defects in our negatives, the latter power being one of the strong points of this process, we must fix upon a standard of exposure—that is to say, a standard light and a standard distance from light to sensitive paper. I do not think there is any need for the use of incandescent magnesium for contact printing on bromide paper, as the paper is usually quite sensitive enough to be used with oil lamp, gas, or even candle light. My own idea, is that the less sensitive the emulsion is—within limits of convenience—the better for the results in ordinary hands. I find that most bromide papers on the market are too sensitive for the best quality and for safety. One firm has of late made its bromide paper considerably more sensitive than it used to be, and I believe that the quality of results is on the average lower than it was with the old and slower brands of paper. For enlarging purposes there is an inconvenience in the use of very slow bromide paper; for instance, twenty minutes of exposure becomes tedious when compared with eight or ten minutes, but nobody would complain bitterly of having to expose twenty seconds in place of ten. Other qualities being equal, I should always prefer a slow bromide paper to one of the rapid brands made for enlarging purposes.

A batch of candles of any ordinary make may be used for our radiant, one candle at a time, of course. "Government standard" candles answer very well. An oil lamp will also answer our purpose if we take care always to turn its flame to the same height, to certify which a mark may be made on the chimney or on any other convenient place. I use myself a "regulator" gas burner, which turns up to one height, and will not allow any greater passage of gas, no matter what may be the main pressure.

The next question is the distance from radiant to the paper. It is even more important to have a standard distance than a standard light, for a slight variation of distance makes a comparatively great variation in actual effect of light on the paper. To get at the effect of variation of distances comparatively we require to square the distances which we wish to compare. Thus an exposure of x seconds at 9 ins. is equivalent to an exposure of $4x$ at 18 ins. This leads us to another important consideration. If we are exposing to our light a large surface of paper, say 10 by 8, the margins of the paper receive appreciably less exposure than the centre if we hold the frame steady and straight centrally in front of the radiant. Even if we put ground-glass or some similar diffusing medium between light and

frame, we do not entirely overcome the inequality. We must therefore keep our frame moving in front of the light, so that each part of the surface of our paper shall get the same exposure. Even with quarter-plate prints I have found inequality of lighting to arise from neglecting to move the printing frame. We can improve matters by holding the frame further away from the light, but this in a great ratio increases the necessary exposure. Probably 12 inches may be taken as a standard distance for sizes up to half-plate, 18 ins. (requiring twice the exposure) will be better for whole-plates, and 24 (require four times the exposure for 12 ins.) will answer for 10 by 8 plates; in all cases I recommend that the frame be moved during exposure. If we can be sure of moving the frame correctly, the 12-inch distance will do quite well for the 10 by 8 plate. An exposure of 20 secs. at 12 ins. distance from my regulator gas burner might be put down as my normal exposure for the normal developers suggested in Chapter X.

After the paper is exposed, it is slid under the surface of clean water about two or three inches deep in a dish some sizes larger than the print. The paper should be turned over at least once in this water, to prevent air bells or uneven wetting. The water acts as a retarder of development, and uneven wetting will cause uneven development. When the paper is limp it is laid face upwards in a flat dish without ridges; the dish is held up for a moment to let all water run off, and the developing solution is "swished" over the surface of the paper; for a minute or so the developer should be kept moving over the paper. If the solution gets under any part of the paper it should be caused to go under it all.

We can learn much about our exposure by closely studying the first appearance of the image. The image should not come up quickly, but very gradually, but it should never stop appearing; provided that details keep on appearing they cannot come up too gradually, within limits. If the details run up in close and hurried succession it is a sign of over-exposure, and the result is this: all details are up before the shadows have had time to let the developer act sufficiently long, and so we get dirty, bad-coloured shadows in our print, and this is precisely the commonest fault in bromide prints. On the other hand, if the high-lights are reluctant to appear, the shadows go on developing till they are clogged and lose all transparency, and this is the second commonest fault we see in this style of printing. The details, as I said before, must follow each other steadily, and by the time that the shadows have got a good colour the details in high-lights should be all out, and the developer is at once to be washed off with acidulated water. I always use acidulated water at this stage of bromide printing, for with ferrous oxalate it facilitates the washing-out of the iron, and with quinol it stops development, which with tap water is very apt to continue unless the water be acid. I simply make my first washing-waters, two or three, smell of acetic acid; then I thoroughly wash out the acid and fix in a hypo bath, 1 hypo to 5 water, made slightly alkaline.

Bromide paper, like other paper, should be allowed plenty of time in the fixing-bath—fifteen or twenty minutes. I saw a statement not long ago in these columns by a good worker, that an immersion of this duration in the hypo bath would reduce the density of the print. I never have known such a thing to happen, and my prints are sometimes an hour and sometimes even longer in hypo. I cannot say what an acid fixing solution might do, for during many years I have not indulged in an acid fixing bath, nor do I ever purpose to do so.

Washing paper prints, is, as already stated in previous chapters, easy or difficult according to the method pursued. It is easily done by a squeegee applied to the back, while a rose-tap plays on the print. My own practice is to squeegee

in that way each print for about four minutes, then to trust to a machine to finish the job in about four hours. Sometimes if a print is put under the tap directly from the hypo, blisters or even "blebs" will appear. If they are put first into water containing a dose of common salt, the blisters will probably not appear. As there is a great deal of fear, or at least doubt, as to the effect of a trace of hypo left in a bromide print, I may say that I have for months kept bromide prints merely rinsed from hypo, without a sign of fading or yellowing. But I do not wish to encourage perfunctory washing—I only wish to allay unnecessary fears.

If it is desired to glaze bromide prints, as for scientific demonstration, the smooth-surfaced paper may be sequestered to tinned ferrotype plates, or to tinned glass plates, or even for very high glaze to tinned and collodionised glass plates, as directed by me in previous chapters on other processes.

Some makes of bromide paper have "soapy"-looking surfaces when the prints are dried *au naturel*; to my mind this soapy appearance is fatal. I would never use such a paper. It may be that my treatment has always been faulty, but with certain brands of bromide paper I have always got that appearance.

Besides the two faults mentioned in this paper—mealy, poor shadows, and opaque shadows with chalky lights—there is another fault often seen, sometimes solitary, sometimes accompanying the mealy shadows. I refer to a bottle-green or dirty brown tone all over the image. This is, I believe, invariably either the result of over-exposure and rapid development, or else, in a few cases, due to an overdose of bromide in the ferrous-oxalate developer. I do not know why bromide should cause this disagreeable colour; by slowing development it might be expected to do the very opposite; but the fact remains and has been noticed by others as well as by myself. Quinol sometimes gives a bad colour on over-exposed prints; I have observed that very frequently.

I am well assured that if bromide printing were more studied than it is, many amateurs would take to it very kindly, and would find what an immense boon it is for printing negatives not perfectly suited to Platinotype Printing.

Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

(Continued from page 332.)

HAND-CAMERAS.

Hand-Camera.—This term is now applied to a small form of portable camera, so constructed that it can be held in the hand during exposure, an advantage that not only enables the photographer to dispense with the clumsy and cumbersome tripod, whose employment the other makes of camera necessitate, but by being quickly prepared for use it places at his disposal the means of photographing views or effects of fleeting duration which would be impossible to procure with the ordinary photographic apparatus. This form of camera was originally called a "detective," but this title is gradually falling into disuse, for the ideas suggested by that distinctive appellation were not of that character which recommended the name to the gentlemanly instincts of the better class of amateur photographers.

Since the manufacturers of photographic apparatus have become imbued with the idea that there is an unlimited demand for a perfect form of hand-camera, so much attention has been given to the improvement of this instrument that it is gradually approaching the acme of perfection, which, under existing circumstances, it can possibly attain.

One by one the defects apparent in the earlier patterns are being overcome, and it is evident that in a short time photographers will be able to procure a form of hand-camera by which as good negatives can be produced as hitherto can only be done by the employment of a much more complicated apparatus. When it has attained this position it will no longer be regarded as a toy, upon which it is unsafe to place reliance if serious or artistic work is contemplated, though, of course, there are, and probably always will be, certain limitations in its use, for they are partly due to certain optical difficulties, which will, without doubt, always remain insurmountable.

Under the stimulating influence of popular demand the inventive faculties of photographers have been quickened, so that the number and variety of hand-cameras now advertised by the dealers in such articles is almost greater than the number of patent shutters, to which we have previously referred. A would-be purchaser should therefore before making a selection have some distinct idea respecting his requirements, and not only be able to recognise those features which should be considered indispensable, but to detect the difference between others which confer distinct practical advantages, and those which can only correctly be described as "fads" or unnecessary complications.

The perfect hand-camera should embrace the following features:—It ought to be light and compact, and capable of being quickly adjusted when required for use. It should possess the means whereby it can be focussed in such a manner that lenses of different focal lengths, as circumstances necessitate, can be used. If glass plates or cut films are preferred by the operator to the employment of a roll-holder, then it should have some simple automatic changing device which will allow the operator to make the necessary change after an exposure quickly and in an unobtrusive manner. The shutter should be capable of regulation from a prolonged or time exposure to one of the most rapid character, and its liberation should be made at a point the finger can easily reach while the camera is being held in a convenient position. A very slight pressure on the spring should be all that is necessary, for if more than this is required the camera is very liable to receive a jar at the very time all movement should be avoided. The construction of the shutter should be of that character that will allow the maximum degree of illumination consistent with the utmost simplicity of construction.

By the narration of the features that should distinguish a hand-camera designed for practical utility it will be seen that considerable ingenuity has to be expended upon it. With the class of hand-cameras which can only be correctly described as toys we have no concern. Judging from the productions resulting from their use, their main aim appears to be the enrichment of their manufacturers by the degradation of photography to a mere shadow producing sport within the limited capacity of feeble-minded men and women who are content to waste plates *pour passer le temps*. And as the people who engage in this pastime are no more qualified to be called photographers than the bumpkin can be so described who while standing grinning into vacancy "drops a penny in the slot" and produces something which he is satisfied to call a photograph, we shall not consider it incumbent upon us to refer to any other forms of hand-camera but those designed for the use of experienced photographers.

A serious fault with many otherwise fairly good forms of hand-camera is that they are not quite light-tight, or, rather, we should say that their construction precludes the possibility of their remaining so for any length of time, due greatly to the fact that there are so many apertures through which light can creep if the door or lids undergo any variation in size, which can hardly be avoided

if the wood or metal is subjected to any climatic changes. A most thorough examination for defects of this character should on no account be omitted, especially if the camera is being procured as an accompaniment of any prolonged travelling, for all the other advantages it may possess will not compensate for the annoyance liable to result from the weak spots of this nature in its construction. It is not enough to be merely satisfied that at the time of purchase it is light-tight; the point should be ascertained that it is so constructed that it will always remain so, unless, of course, it meets with an accidental injury for which no safeguards can be provided. We strongly emphasise the advice to give most careful scrutiny for defective points of this character, and to refuse to purchase an instrument in which they are apparent, for after some considerable experience we have found that they are the source of a large proportion of that trouble which amateurs experience in producing clear, sparkling negatives with the aid of their hand-cameras.

We consider a roll-holder almost a necessity with a hand-camera. Not only is the weight reduced by its employment, but the convenience resulting from having forty or fifty exposures ready by the mere winding of a key supplies this form of camera with one of its principal charms. However, as these views are not shared by everyone, for many photographers prefer to always employ glass plates, and under any circumstance the power of using them should be supplied with all cameras, therefore an automatic or some similar changing device should exist, which should be most carefully tested to find out that it can be worked easily and possesses no complications that may cause a sticking of the plates or the throwing of them out of register. In some methods of accomplishing this requisite changing a liability to the creation of dust exists, and under certain conditions this defect may become excessive; but by having the interior of that portion of the camera wherein the changing takes place occasionally rubbed over with glycerine, it can be considerably reduced. Another annoyance which exists in some of the methods adopted to effect the desired changing results from the plates getting scratched during the operation. The placing of small discs of gummed paper at the corners of the sensitive side of the glass may to some extent mitigate this evil; but it is, of course, better where any choice exists to select a form of mechanism in which no liability to this species of damage can arise.

(To be continued.)

THINGS ONE WOULD RATHER HAVE EXPRESSED DIFFERENTLY.—Photographer: "Please look a little pleasant, miss. I know it's hard, but it's only for a moment."—*Punch*.

MR. HICKS, of Hatton Garden, has sent us an 8oz. opaque measure, which is calculated to meet a want long felt in the dark-room. The measure is made of opal glass with a clear strip about half an inch wide, ground down each side, on one of which are drawn the marks for ounces and half ounces. The effect of this is that on looking at the light through the clear strips, absolute accuracy can be obtained in measuring quantities in the dark-room.

"QUAINT LONDON."—We have received from the publishers, Messrs. Truslove and Sairley, 7, St. Paul's Churchyard, London, E.C., a copy of "Quaint London," by "Old Mortality." The book contains several very excellent illustrations, reproductions of photographs of interesting relics of Old London, with descriptive letterpress. Most of the illustrations are taken from the photographs of the Society for Photographing Relics of Old London, by permission of Mr. Alfred Marks. The reproductions are produced from photo blocks in two printings, and an effect of light and shade is thus secured which is often absent in prints from the ordinary photo blocks. All those interested in old land-marks should procure a copy of "Quaint London," which is published at 1s. 6d. The book has been produced by Messrs. Hazell, Watson, and Viney, Ltd., of London and Aylesbury.

Science Notes.

In a lecture on "Colour Vision and Colour Blindness," delivered before the Royal Institution on May 9th, Mr. Brudenell Carter finely describes the structure of the "seeing eye." "In the human eye there is a small central region in which the perceptive layer consists of cones only, a region which the fibres avoid by curving round it, and in which the other layers of the retina are much thinner than elsewhere, so as to leave a depression, and are stained of a lemon-yellow colour. In a zone immediately around this yellow spot, each cone is surrounded by a single circle of rods; and, as we proceed outwards towards the periphery of the retina, the circle of rods around each cone becomes successively double, triple, quadruple, or even more numerous. The yellow spot receives the image of the object to which the eye is actually directed, while the images of surrounding objects fall upon zones which surround the yellow spot; and the result of this arrangement is that, generally speaking, the distinctness of vision diminishes in proportion to the distance of the image of the object from the retinal centre. The consequent effect has been well described by saying that what we see resembles a picture, the central part of which is exquisitely finished, while the parts around the centre are only roughly sketched in. We are conscious that these other parts are there; but if we desire to see them accurately, they must be made the objects of direct vision in their turn."

Both naturalists and anti-naturalists will, we are sure, derive comfort from this able summing-up of "the case for the eye." Both will doubtless claim it as a distinct pronouncement in their favour.

There is to be an "International Medico-Scientific Exhibition" in connection with the Medical Congress which is to be held at Berlin from August 4th to 9th. Among the objects specially desired are "apparatus for photography and spectrum analysis so far as they are of service to medicine." Exhibitors should apply to Dr. Lassar, Berlin, N.W., Karlstrasse 19.

Mr. Isaac Roberts recently presented to the Royal Astronomical Society a photograph, taken by himself on January 12th, of stars in the region of Tycho Brahe's Nova, with an exposure of 2 hours 55 minutes. Comparison with a map of the same region made by the astronomer D'Arrest in 1864 shows that six stars mapped in this region by the latter are now missing.

At the last meeting of the Royal Astronomical Society, Mr. Knobel said that he had recently visited Dr. Vogel's observatory at Potsdam, where he had the pleasure of inspecting the first photographic telescope, made according to the recommendations of the French Congress for the photographic survey of the heavens. The photographs taken with it (including one of the Orion Nebula, and one of the star-cluster 67 M. in Cancer) give beautiful images up to 1 deg. 16 minutes from the centre of the field. It was found that white stars only required one-tenth of the exposure of the red stars to give the same image on the dry-plates employed.

The largest lens-disc ever cast has just been forwarded by the makers (Messrs. Mantois, of Paris) to Alvan Clark Brothers, in the United States. It is a disc of crown glass which the Clarks will form into a lens forty inches in diameter. When its companion lens of flint glass is completed, the two will form the objective of a magnificent refracting telescope (the largest in the world), which will require a tube sixty feet in length, and which will be the property of the University of Southern California.

Mr. Stanley writes to repudiate the statement that he has accepted £1,000 for the permission to take his photograph. But why should the great explorer not have accepted the offer and devoted the money, if it pleased him, to some good object? It is well known that many public personages see nothing wrong in receiving an honorarium from the photographer who immortalises them. Madame Patti's fee is, we believe, £200.

By the death of Colonel Stuart-Wortley, at the age of fifty-eight, photography has lost an influential and ardent devotee. Twenty years ago he stood in the very forefront of our workers, and though illness had of late years interfered with the active prosecution of the "light-science," his interest in it was as keen as ever.

The Natural History Society, at Rugby School, has formed a section for photography, and they intend to work for the Warwickshire survey. No wonder that photography flourishes at Rugby when the science master is Mr. A. F. Donkin, brother of the late

Secretary to the photographic Society of Great Britain (Mr. W. F. Donkin, whose lamented death in the Caucasus will be fresh in the memory of our readers).

At a recent meeting of the Washington Chemical Society, Dr. Thomas Taylor, of the United States Department of Agriculture, exhibited a new flash-light intended to take the place of several kinds which have proved highly dangerous. The composition, as described by *Science*, consists largely of charcoal made from the silky down of the milk-weed—a form of carbon which Dr. Taylor prefers to all others, because of its freedom from ash. A few grains of this composition placed on tissue paper and lighted by a "punk-match," produced a prompt and blinding flash. The paper on which the powder rested was not even scorched. The flash being instantaneous, the heat is not sufficient to ignite the most inflammable material on which the powder may rest. An inferior flash-light being used with the same paper for a base, the paper at once caught fire. This was owing to the comparatively slow combustion of the chemicals used in the inferior grade. Dr. Taylor said the powder of his new flash-light would not explode either by concussion or by friction.

F. G. S.

Stereoscopic Slide Competition in Paris.

We have been favoured with the annexed translation of circulars emanating from the Paris Photo Club, and which have been addressed to the Secretaries of various photographic societies in the United Kingdom. A courteous letter from the Secretary of the Paris Society asking for support in the undertaking accompanies the circular. We wish the promoters of the competition all success, and hope that our "Britisher" knights of the camera will take part—and honours—therein.

PARIS PHOTO CLUB.

(Society of Amateur Photographers for the Study of Photography and its application to Arts, Science, and Industry.)

FOUNDED IN 1888.

Rooms of the Society in Paris: 40, Rue des Mathurins.

Paris, April 20th, 1890.

SIR,—We have the honour of informing you that on the personal initiative of M. Maurice Bucquet, President of the Photographic Society of Versailles, Secretary General of the Paris Photo Club, member of the Amateur Photographer Society of Excursions, a competition of stereoscopic slides is now open at the Paris Photo Club, 40, Rue des Mathurins.

This kind of photography, after having enjoyed an unexpected popularity, is unfortunately rather neglected at the present day. Our colleague wishes to assist in reviving in amateurs the predilection for the stereoscope, the artistic side of which they cannot fail to perceive.

We hope that you will kindly take part in the Competition, and in that way contribute to its success. The rules will be forwarded with this.

Accept, dear sir, our kindest regards,

THE COMMITTEE OF ADMINISTRATION.

The Paris Photo Club places its laboratories at the disposition of the photo societies of the provinces and of foreign countries on the presentation of their cards of membership.

All information to be had from the office of the General Secretary, 40, Rue des Mathurins, Paris.

RULES OF THE COMPETITION OF STEREOSCOPIC SLIDES.

1. A Stereoscopic Slides Competition is now open at the Paris Photographic Club, and will be closed on June 15th, 1890. A public exhibition of the works sent in will take place at the Society's rooms, 40, Rue des Mathurins, from the 15th of June to the 1st of July, and will be open every day from 9 a.m. to 6 p.m.

2. Every amateur, French or foreign, can take part in the competition by conforming to these regulations.

3. The costs of transport (sending and returning) of the works sent in, will be at the expense of the competitor.

4. The number of slides sent in by each competitor must not be less than twelve or exceed twenty-four. These slides must not have been exhibited at any other Exhibition. They can be either on paper or on glass. The competitors who desire to send slides of unusual dimensions, that is to say, other than $6\frac{1}{2}$ by $3\frac{1}{4}$, must furnish the special apparatus for examining their work.

5. The slides must be numbered and accompanied by a note, signed by the competitor, explaining the kind of apparatus, lens, stops, plates, development, kind of paper, toning, etc.

6. The applications must be addressed to the office of the general Secretary of the Paris Photographic Club, 40, Rue des Mathurins, before the 10th of June. The exhibits will be received there up to noon June 14th; later than this exhibits will be rigorously refused.

7. A list of the members composing the jury will be submitted to the competitors in due time.

8. The decisions of the jury are final.

9. Silver gilt-medals, silver and bronze, will be awarded to the successful candidates; the number will be proportionate to the number of competitors.

10. The prize-slides will remain the property of the Photo Club, and will be placed amongst its permanent collection.

(Signed) THE COMMITTEE OF ADMINISTRATION.

The negatives and positives must be the competitor's *own work*.

A Record in Development.

MANY amateurs are so fidgety about their dark-room and its appendages, that we describe, both for the benefit of the finic and also for "those who go down to the sea"—in trains, how an extemporised travelling dark-room was successfully used by a member of the newly-founded Croydon Camera Club.

In case the railway Superintendent should reprimand the guard who connived at the measures adopted, we must perforce suppress the gentleman's name, the date, and the station where the train was joined.

About a fortnight ago Mr. X. ran down for the day to visit his friend Y., who dwells somewhere on the south coast, within about one and a half hour's journey from Croydon. Mr. X. having exposed sixteen quarter-plates, Y. enquired of him when they would be developed. "To-night," answered X., and added, "Perhaps before I get to Croydon." Y. expressed incredulity, on which X. guaranteed that he would have all the plates developed before reaching his destination.

No previous preparation had been made, and the train started in forty minutes from the time of above conversation. A sheet of ruby paper, some drawing pins, some oiled paper, and a piece of Willesden waterproof paper, together with Beach's developer, in two solutions, were procured. The guard was duly "tipped," and a pail of water obtained from the engine-driver. Mr. X. being safely locked in a third-class compartment, the Willesden paper was made into a tray, with sides three inches deep, on account of the swaying of the train. The ruby paper was pinned over the carriage lamp, and the blinds carefully drawn. The night was, fortunately, a dark one. Most of the plates were shutter views; these were first developed, the developer being used for about three plates and then thrown away. The time views were subsequently developed, with a suitable modification in the proportions of developer. The plates were well rinsed in the pail of water, and while wet wrapped in oiled paper, and thus packed in the ordinary boxes in which they are sold; the object of using oiled paper being that it does not stick to the film when the latter is either dry or wet. The plates were all developed before Red Hill was reached; the fixing being deferred until arriving home.

The resulting negatives were not noticeably inferior to those which the same worker generally produces in his dark-room. We have before us a print of a wreck with fisher-boats "salvaging," which is distinctly above the average skilled amateur work.

If so good a result is attained by adapting a railway carriage on the spur of the moment, even better could be done by pre-arranging to make use of the dreary time spent in travelling by night. The above *tour de force* is a strong argument in favour of those railway companies who run journeys of from five hours upwards, such as the Scotch express, providing a well-fitted but inexpensive dark-room. A luggage van might be converted, with an open compartment for workers to sit in when their "dark deeds" are done.

A pleasant vision is opened up of snap-shot views, taken from a railway carriage, and developed during the journey. Of course, plates need not be exposed while the train is "hurtling" along at seventy miles an hour; but in a, say, ten hours' journey there are many stoppages and slackenings of speed which a member of the "wideawakes" could profitably utilise.

Notes from the Liverpool Centre.

(By our District Editor.)

INTEREST in the Photographic Convention of the United Kingdom to be held at Chester continues to increase. The representatives of the Liverpool Association at the Convention will be Messrs. Paul Lange, President; E. M. Tunstall, Hon. Sec.; B. J. Sayce, T. S. Mayne, and W. P. Christian. All the Liverpool representatives are members of the Council of the Society.

At the Liverpool rooms last Wednesday Mr. H. H. Williams was the demonstrator; subject, "Silver Printing and Toning." There was a very full attendance, the President in the chair. Mr. Williams showed some old plate prints, and then dealt masterfully with his subject. Photographers could print how they liked, but if they had not a good negative to begin with they could never get a good result. To fume with ammonia was useful but not altogether necessary. If the bath was the slightest degree acid the better. The following was a good bath:

Phosphate of soda	30 grs.
Water (lukewarm)	8 ozs.
Gold, 15 drn. solution. Bi-carbonate of soda.	

Afterwards the subject should be washed, to get most of the "milkiness" out. Matt-surface paper picks up the gold very quickly. The toning should be continued until just a trace of red remains. To remove the red, rub over with powdered bi-carbonate of soda. Fix the prints for twenty minutes in strong, freshly made hypo. Mr. Williams also explained his fuming box, which is a square American biscuit tin with false wooden bottom to prevent paper touching the ammonia, saucer to hold the liquid ammonia, holes bored in false bottom to allow the fumes to reach the paper. A tightly fitting lid with space to put the paper in completes the ingenious contrivance. An interesting discussion followed, and then a hearty vote of thanks proposed by the President. Mr. Williams is going abroad almost immediately, otherwise he would have given a further demonstration. At the next demonstration, on 28th inst., Mr. Lange will take as his subject "Platinum Printing and Toning." For Saturday an excursion has been arranged to Rossett and Gresford, North Wales. A through fast train will convey the party about noon, special arrangements having been made with the railway company.

The Boston Camera Club slides of "The White Mountains," New Hampshire, have just come to hand, and will be exhibited before the Liverpool Society and friends at the ordinary meeting on the 29th inst. The slides are accompanied by seventy half-plate and full-plate duplicates beautifully mounted on cards, attached to each of which is a letterpress description, in detail, of the picture. The lecturer has, therefore, all "plain sailing." The work, so far as can be now judged, is high class, though not so good as some of our best home work. We have as charming scenery, too, here at home as the Bostonians have sent in their set of plates. The series was prepared in 1889 by members of the Boston Camera Club.

Mr. E. Roberts is exhibiting three lantern-slides, one by the pyro and ammonia process, one by the soda process, and the third by the ferrous-oxalate process. The trio show the characteristics of each remarkably well, and are especially interesting to the inexperienced. Mr. Roberts is a photographer of upwards of thirty years' standing.

The Liverpool exhibits from the Crystal Palace and Newcastle are now hung in the Liverpool Society's rooms, Lord Street. The members regret that they have not the successful Birmingham set to accompany their own. The last-named, however, when applied for, had been distributed.

Mr. Paul Lange's Crystal Palace (Silver) Medal and the AMATEUR PHOTOGRAPHER (Gold) Medal are much admired.

Wallasey Photographic Association.—At the monthly meeting of this association, Mr. E. Kite, Vice-President, in the chair, Mr. Jas. Gill gave a paper and practical demonstration on "Bromide Printing." He prefaced his remarks by saying that although this style of printing was now rather obsolete it came in useful for those who were engaged all day in business. He advocated bromide printing for poor or thin negatives, also the use of hydroquinone as the developer, in preference to the red ferrous-oxalate. He then exposed and developed a print, with gratifying success. A discussion, and thanks to Mr. Gill followed. Mr. Wilkinson exhibited some very successful negatives of the Liverpool May Day processions, developed by Eikonogen, finished with hydroquinone. The outdoor meeting of the society was

held on the 10th inst., at Eastham. At the next meeting Mr. Gregg will give a paper on "Home-made Sensitised Paper."

The conditions, schedules, etc., of the Liverpool (1891) Exhibition, specially printed in French and German for Continental competitors, are now in the hands of the printer, and in a day or two can be had on application to Mr. T. S. Mayne, Photographic Association, 3, Lord Street, Liverpool.

The details of the Birkenhead Society's Annual Prize Competition appear to have given general satisfaction.

Our Contemporaries at Home and Abroad.

THE *Beacon* (Chicago) gives the following:—At a recent meeting of the French Photographic Society M. E. Vallot showed a successful *Contretype* in china ink, produced as follows: A glass plate had been coated with bi-chromated gelatine and exposed under the negative to be reproduced. It was then developed in water, holding in suspension a sufficient quantity of china ink, when the parts not acted on by light softened and absorbed the coloured liquid, while the parts hardened and rendered insoluble remain clear. Other insoluble colouring matter may be used as well as china ink, so long as it is stable under the action of light. Articles: "The Angle of View," "Daguerre Memorial," "The Optical Lantern," "The Light of Other Days," etc.

The *St. Louis and Canadian Photographer* (St. Louis) gives the following remedy for blisters:—"Remove the prints from the toning bath to a strong salt bath containing one ounce of stronger ammonia to each gallon of salt solution. Add ammonia to the fixing bath in the same proportion, and finally, remove prints from fixing bath to a salt and ammonia bath, as above. The prints should remain in the salt-ammonia baths at least twenty minutes each. The ammonia seems to soften the sizing in the paper so that the gas, spoken of by Mr. Sherman, escapes without separating the albumen from the paper. This is not an infallible 'cure,' but has proved most satisfactory." Articles: "Toning and Fixing Albumen Prints in One Operation," "The Art of Retouching," "Tabulated List of Explosive Substances," "Photographic Reminiscences," "The Next Convention," etc.

The *Photographic Globe* (New York) gives the following: "Frequently in developing, a plate will come up very hard, and a remedy is often asked. Too much pyro is often the cause, and if it be impossible to change the developer, a few drops of hyposulphite of soda taken from the fixing bath will soften its appearance. There is less danger in using a few drops of hypo with Eikonogen than with any other developer; in fact, the addition of hypo to Eikonogen developer, in the proportion of 1 to 1,000, shortens the time of development considerably." Articles: "The Daguerre Memorial," "Sketch of the Life of Daguerre," "A Tropical Tramp of the Tripod," etc.

"FALLOWFIELD'S PHOTOGRAPHIC ANNUAL, 1890."—One of the most useful publications published each year is "Fallowfield's Annual." If every worker in photography possessed a copy, editors of photographic journals would occasionally be able to take a holiday, or join in the pleasures and revels of a photographic "outing." Mr. Fallowfield has given the world, in his "Annual," information regarding every possible form of apparatus. He fortunately does not pretend to give instructions as to which lens or which camera to purchase, but he does give prices, sizes, etc., and descriptive letterpress of every article required by a photographer, whether an amateur or professional, and also most complete working formulæ for nearly all the developing and printing processes. This year he has added an appendix in the form of "Photographic Hints," many of which it would be well to commit to memory. We so often have the privilege of examining apparatus made and sold by Mr. Fallowfield, and our opinion of his goods is so well known, that we do not consider it necessary to select any of the hundreds of articles described for special comment in this column; we can only express the hope that our readers will early possess themselves of a copy of the "Annual," and derive the same instruction from the perusal of its pages as we have done.

Societies' Meetings.

BELFAST CAMERA CLUB.—On Saturday, the 17th inst., a visit was paid to Bryansford, co. Down, the beautiful seat of Lord Roden. The rain which fell on Friday had given a freshness to the trees, and the river had a full head of water, which added greatly to the beauty of the cascades which abound on its course. The old moss-grown bridges, the pretty reach of river scenery, and the old saw-mill claimed many plates, while good views were obtained of woodmen at work, felling and trimming trees. The cattle and sheep in the pastures were also attended to. On reaching Newcastle a substantial tea was provided, and whilst partaking, the work of the day discussed.

BRIXTON AND CLAPHAM.—A special meeting was held on Friday, May 16th, when Mr. J. Gale read a highly interesting paper on "Photography as a Pastime." Mr. Gale's remarks were listened to with marked attention, and frequent applause testified to the appreciation which a fine selection of his beautiful lantern-slides met.

DARLINGTON PHOT. SOC.—The ordinary monthly meeting of this Society was held in the Trevelyan Hotel, on Monday, the 12th inst. Mr. Ensor (the President) read a most interesting paper on "Platinum Toning," and handed round prints illustrating the various methods. Specimens of aristotype and platinotype, shown by Messrs. Cooper and Howlett, were much admired. It was decided to have an excursion to Hexham and district on June 14th.

EAST DULWICH AND PECKHAM PHOT. SOC.—At the meeting on the 16th inst., the President in the chair, seven members were added to the roll, bringing the total up to eighty-three. It was resolved that the society purchase a 12 by 10 camera and lens, etc., to be loaned out to the members under such conditions as the Committee may determine, and that the same be purchased immediately, so that it may be used on the excursion to Pangbourne on Whit Monday. The remainder of the evening was devoted to an informal discussion on apparatus. Mr. Rice showed a capital 5 by 4 camera he was in the habit of using on his cycling excursions, with one of Watson's four-fold cycling stands and half a dozen double backs, which was easily carried on the machine, or, when walking, without fatigue. There was also shown a Victoria camera, made by Mr. H. Park, of Acton Street, London. This camera is very light and portable, but when set up is extremely rigid. It is an excellently made instrument, fitted with a simple arrangement for bringing the back close up to the front for use with short-focus lenses, while the full extension admits the use of long-focus lenses. The side swing to the back is got in a very ingenious though simple manner. The opinion of the members was that it is an exceedingly compact instrument, being soundly and well made, and moderate in price.

HOLBORN CAMERA CLUB.—On Friday the 16th inst. Mr. Cobb gave a demonstration on "Toning Silver Prints," using the phosphate and acetate of soda baths, with both of which he obtained good tones. Owing to shortness of time, he was unable to go into the matter of mounting prints, which was also on the programme. This evening, the 23rd inst., is a lantern night.

IPSWICH PHOT. SOC.—The first excursion of the season took place on the 17th inst., when several members, including their veteran President, went by train to Claydon. Here the party was met and welcomed by the Rev. E. Ledger, M.A., and who kindly invited them to tea at his Rectory at Barham. At Claydon Bridge a division of forces was made, some members following the River Gipping to Blakenham (shutter men "stalking" swans and sheep by the way), where interesting subjects were found in the mill, the church, and the "Chequers" Inn, the latter claiming to be one of the oldest licensed houses in Suffolk, while other members crossed the fields to Barham, finding pictures in the Old Manor House, the church, and the picturesque "slade." Then followed tea, provided by the Rector and Mrs. Ledger, which brought the afternoon to a satisfactory termination.

JEFSEY AM. PHOT. SOC.—A special meeting was held on the 30th ult., for the purpose of examining and voting for the prize picture taken at the excursion of the 10th. Seven pictures were exhibited, and, under the circumstances of bad weather and bad light, they far surpassed expectations. The prize picture obtained five votes, and was done by Miss M. Le Cornu. It

represented the water-mill at Grève-de-Lecq with the miller carrying an empty sack in his hand and entering the doorway of the mill. The second picture, by Mrs. Smith, was declared as having been "retouched," and was excellent. It represented the mill without any figures, and gained four votes. Miss M. Le Cornu also obtained two votes for an instantaneous picture of a wave. Mr. Rogers obtained one vote for a bromide print of the lodge at the entrance to Saint Owen's Manor. On the 3rd inst. nine members left for Gouray at one p.m., under the leadership of the Secretary, Dr. H. C. Taylor. The sun was obscured, but the light good, and improved greatly towards four p.m. Views were taken in the old château, and, on the pier, of the castle itself (Mont Orgueil), fishing vessels, etc. Some children round an old boat were also secured.

KENDAL LITERARY AND SCIENTIFIC INSTITUTION (PHOT. SECTION).—The May meeting was held on Wednesday, the 14th inst., Mr. Gilbert Gilkes, C.E., in the chair. The summer field meetings were discussed and several arranged for. One new member, a lady, was elected. Mr. Dodgson (Art Master, Kendal School of Art) read a paper on "Pictorial Composition." This was copiously illustrated with diagrams and blackboard sketches. The main points referred to were, choice and selection of subject, balance, relative proportion of earth and sky, clouds, lighting of picture, variety of shape of picture, harmonious balance of lines, placing of figures in groups, proper subordination of parts or accessories, choice of figures in landscape, etc. A very interesting discussion on the relative value of the photographic and painter's work, etc., ensued. Mr. S. Rhodes proposed and Mr. Theo. Wilson seconded a vote of thanks to Mr. Dodgson for his kindness and trouble.

LEICESTER AND LEICESTERSHIRE PHOT. SOC.—A regular meeting of the society was held on the 14th inst., Mr. Geo. Bankart in the chair, in the absence of the President, Mr. S. S. Partridge. Two members were ballotted for and unanimously elected. The report of the Excursions Committee was brought up, and the following recommendations were accepted: June 19th, excursion to Stratford-on-Avon; July 17th, Forest District; August 14th, Miller's Dale (half-day); September 11th, Maxstoke Priory. The medals were then presented to the successful competitors in the print competition, held April 15th, as follows:—Society's medals, for prints over whole-plate: silver medal, Mr. Geo. Bankart; bronze medal, Mr. F. Pierpoint. Past-President's medals, presented by Mr. Geo. Bankart, for prints under whole-plate: silver medal, Mr. A. W. Wilson; bronze medal, Mr. W. Jolliffe. Mr. Sculthorp having resigned his position as Treasurer to the society, Mr. A. W. Wilson was unanimously elected to the post.

LEWISHAM HIGH ROAD CAMERA CLUB.—The social meeting of this club was held on the 16th inst. The exhibition of slides (the work of members) was proceeded with. Mr. R. W. James presided at the lantern, a very ingeniously-constructed piece of apparatus of his own invention, which might almost have been styled a "pocket lantern." The slides shown were numerous. Warm tones were certainly remarkable by their almost entire absence, but in their place some very fine specimens of pure black were shown, and those ranging between the two were very good indeed. A number of the slides shown were taken with Rouch's detective and a Key camera. Miss Wesson, R.A.M., and Mr. E. P. Miles entertained the audience with several pianoforte solos. The President, the Rev. J. Morley Wright, made a short speech, and two honorary members, Lord Lewisham, M.P., and A. H. Tarleton, Esq., and five members were duly elected. The next meeting is fixed for Friday, June 6th, at 8 p.m.

WEST LONDON PHOT. SOC.—On the 3rd inst. about thirty members of the Society met at "Jack Straw's Castle," Hampstead, and spent a very pleasant afternoon. On the 9th inst. the annual smoking concert took place at the Richmond Hotel, Shepherd's Bush Road, and proved a great success. The programme was in itself a work of art, having been photo-etched by Mr. Walter L. Colls from a design by Mr. J. Martin Dickens. Under the able chairmanship of Dr. Low a most enjoyable evening was spent. On the 17th twenty-eight members visited Weybridge.

WOOLWICH AND DISTRICT PHOT. SOC.—A meeting was held in St. Saviour's Schools, Cannon Row, on Wednesday, May 14th. The Rev. J. W. Horsley (the President) gave a short account of the uses photography could be put to, and expressed a belief that he should live to see photography in natural colours in everyday practice. On Saturday afternoon, the 17th inst., the members had their first out-door meeting at Bostal Wood. This Society now has twenty-four members.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the **number and full title of the query** referred to.

QUERIES.

3827. Dark-Room.—Can anyone kindly give directions for putting up and fitting a dark-room, about 10 ft. by 5 ft.; materials to be Willesden paper or wood framework? It can be built in a corner made by two brick walls, out of doors. How should flooring be done? Or can anyone give exact reference to any magazine where such a dark-room is described?—**ST. BERNARD.**

3828. Penarth, South Wales.—Can anyone give me any particulars as to the above town or district, views, etc., worth taking, and oblige?—**WELSHMAN.**

3829. Boxhill.—Can any reader tell me the most important places to photograph there?—**BOY AMATEUR.**

3830. Swansea.—Will any reader tell me the best places to photograph in and about neighbourhood, as I am going to stop there about July-August for a month; also a place for obtaining plates, Ilford?—**BOY AMATEUR.**

3831. Vignette.—Will any reader inform me of the best way to make same?—**BOY AMATEUR.**

3832. Purple Tones.—Will any amateur photographer kindly tell me how to get good purple tones to my prints? I use the following developer:—

I.		
Pyro	...	50 grs.
Sodium sulphite	...	150 "
Citric acid	...	10 "
Water, distilled	...	1 oz.

II.		
Bromide potassium	...	50 grs.
Water, distilled	...	1 oz.

III.		
Ammonia, '880	...	2 drms.
Water, distilled	...	2½ ozs.

For Half-Plate.		
Water	...	1 oz.
No. 1	...	20 minims.
No. 2	...	30 "
No. 3	...	60 "

Fixing.		
Alum	...	2 ozs.
Water	...	1 pint.
Hypo	...	2 ozs.
Water	...	10 "

Gold Solution (Stock).		
Gold	...	15 grs.
Water	...	7½ ozs.

Toning Bath.		
Acetate of soda	...	30 grs.
Water	...	10 ozs.
Gold (solution, stock)	...	½ oz.

Hypo Bath.		
Hypo	...	2 ozs.
Water	...	10 "

When I tone I find my prints turn a horrid red colour. How can I get good tones?—**EGHAM.**

3833. Plates.—What is the sensitometer number of Ilford ordinary?—**SLOWPLATE.**

3834. Lens.—Could anyone tell me the focus of lens and number of stops in the Instantograph old pattern, half-plate?—**UNKNOWN.**

3835. Channel Islands.—As I intend spending a few weeks at Jersey in June, I shall be greatly obliged if any reader will be kind enough to give me

particulars of any choice "bits" worth photographing, also as to exposure (I am using Lancaster's half-plate Instantograph). Is there a dark-room in any of the hotels? If so, please kindly give address. I shall also be glad to know if there is any difficulty in passing the customs. Intend going direct from London by steamer.—**H. W. REID.**

3836. Norway.—Will any reader kindly tell me whether exposures in Norway during July should be the same or shorter than in England? As the days are much longer, to what hour in England would 6 o'clock compare in intensity of light? Is there much difficulty in changing plates in hotel bedrooms, from the absence of shutters? What is the Norwegian for "to change plates"? Any information will greatly oblige.—**MELCHIOR.**

3837. Toning and Fixing.—Will anyone kindly tell a beginner the best way to tone and fix prints, and which is the best paper to use?—**LIMPET.**

3838. Case for Camera.—I have a half-plate camera, Lancaster's Méritoire. Which would be the best and lightest case to get to carry it in?—**LIMPET.**

3839. Marlborough.—I am about to make a tour in Savernake Forest and that neighbourhood, and would be much obliged to anyone who will kindly say what objects of interest there are there worth photographing? Also for any hints as to light, exposure, etc.?—**AMATEUR.**

3840. Herne Bay.—Can I procure Ilford plates at Herne Bay, in Kent, and also is there a dark-room available for use?—**TENNIS RACQUET.**

3841. Portable Studio.—Will any reader oblige with working plans or drawings for a respectable-looking portable studio? Will purchase. Any suggestions from those who have built one will be thankfully received.—**EXCELSIOR.**

3842. Toning Baths, Aristotype.—Are separate toning and fixing baths, or a combined one, best for aristotype prints? Will the combined bath keep, and what is the function of the sulpho-cyanide of ammonium, which seems to be a constituent of all the formulae?—**H. C. L.**

3843. Gelatine for Opalines.—What gelatine is the best for mounting opalines; some kind that will not turn yellow with age?—**H. C. L.**

3844. Concentrated Developer.—In making up a concentrated pyro developer is it better to mix the bromide with the pyro or with the alkali?—**H. C. L.**

3845. Hand-Cameras.—Will someone who has had experience advise me which is the best hand-camera to buy for all-round work. And will they kindly give me the following information: Does the far distance in landscapes come out clear and distinct? Can portraits and interiors be taken by a fixed-focus lens? And will the negatives stand enlarging up to, say, 10 by 12? I have also a great deal of difficulty in getting aristotype prints off glass, after they have pressed on it, although I always rub it well with talc.—**MOONLIGHT.**

QUERIES UNANSWERED.

Mar. 7th.—Nos. 3528, 3551, 3554, 3556.
21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3612, 3613, 3614.

28th.—Nos. 3634, 3636, 3637, 3638, 3640, 3641, 3643, 3653.

April 4th.—Nos. 3661, 3664, 3674, 3677.

11th.—No. 3694.

18th.—Nos. 3703, 3708, 3718.

25th.—Nos. 3727, 3731, 3735, 3738, 3742, 3744, 3747.

May 2nd.—Nos. 3758, 3767.

9th.—Nos. 3793, 3795.

16th.—Nos. 3805, 3808, 3814, 3817, 3820, 3822, 3823, 3824, 3826.

ANSWERS.

3783. Instantograph Lens.—I would give ¼ sec. with the largest stop ($f/11$) of the above lens, and develop slowly.—**P. K.**

3790. Wanstead Park.—I have frequently gone to Wanstead Park, taking my plates from the City, but I now find it much easier to carry empty slides, and obtain the Ilford plates, or any other kind, from Mr. Ferguson, photographic chemist, Cann Hall Road, Leytonstone, which is about five or ten minutes' walk from the park, who allows purchasers to change gratis. I found this place especially useful. One Saturday when I had the whole day in the park I had but three slides, and I went back to the above shop and put in a fresh supply.—**W. J. THOMPSON.**

3790. Wanstead Park.—Yes, you can obtain Ilford or Fry's plates at Ferguson's, photographic chemist, Cann Hall Road, and change your slides in his dark-room. I found a lot of dust and pinholes after carrying plates so far when I took them from home to business, and then to Wanstead Park. You can stop either at Stratford or Maryland Point, and get a penny tram to Cann Hall Road, which is the most direct way to Park entrance. Charge your slides, and walk to the Park. If, after exposing, you have time to return and re-charge for another batch of exposures, it is a great advantage, as there are more subjects than one day can possibly embrace.—**FALCON.**

3797. Vignette.—A light-grey coloured material.—**B. DAVIDSON.**

3797. Vignettes.—Try the usual neutral tint. Dyson's or Lund's being very cheap, and a small one would do.—**EIKO.**

3793. Background.—"Prison Yard" should hang a blanket up for a background.—**CONVICT.**

3793. Background.—Try Vever's or Lund's, or if that is too much use brown paper or a blanket.—**EIKO.**

3799. Fixed Focus.—If you have Mr. E. J. Wall's "Dictionary of Photography" you will find it stated there very fully, and from a proper authority as he is, you will get good advice.—**EIKO.**

3799. Fixed Focus.—In reply to "Puzzled," objects beyond 100 ft. would be probably in exact enough focus for his purposes, with a lens of 10½ in. focus, or if he used a stop of $f/20$, or smaller, a distance of 45 ft. would answer. He had better make some experiments. See reply to "M. R."—**J. G. P. VEREKER.**

3799. Fixed Focus.—You do not state the diameter of diaphragm aperture. You can work it out for yourself by using the following rule:—Multiply 2.7 by the square of the focal length of the lens, and by the fraction expressing the diameter of the diaphragm aperture—thus, supposing you require the nearest point in focus with a lens 10½ in. focus, using $f/10$ stop, $2.7 \times 10\frac{1}{2} \times 10\frac{1}{2} \times \frac{1}{10} = 2.7 \times 110\frac{1}{4} \times \frac{1}{10} = 29.76$ yds. (say 29½ yds.), that is to say, everything beyond 29½ yds. will be in focus. I have worked out the following for you:—Lens 10½ in. focus, $f/8 = 37\frac{1}{4}$ yds., $f/10 = 29\frac{1}{2}$ yds., $f/16 = 18\frac{1}{2}$ yds., $f/20 = 14\frac{1}{2}$ yds., $f/32 = 9\frac{1}{2}$ yds., $f/64 = 4\frac{1}{2}$ yds. approximately.—**B. DAVIDSON.**

3800. Lens.—Find out whether the marks on your stops represent their focal values. This you can do by measuring the diameters of the stops. If that is so, and you are correct in stating the lens is 4 in. focus, then the diameter of 4.9 should be 0.81 in., 7.35 = 0.054, 9.8 = 0.41, 19.6 = 0.20, 39.2 = 0.10, 78.4 = 0.05. Their relative rapidity would be approximately 24, 54, 96, 384, 1,536, 6,144; so that if in a certain light 4.9 requires an exposure of 1 sec., 7.35 requires in the same light 2½ sec., 9.8 = 4 secs., 19.6 = 16 secs., 39.2 = 64 secs., 78.4 = 256 secs. If "Vengeance" does not make the measurements agree, if he will send me actual ones, I will give him the focal values.—**B. DAVIDSON.**

3800. Lens.—The numbers marked on the stops of "Vengeance's" lens are evidently on the area system. Therefore, if he divides the numbers by 4.9 on the first stop he will get a list of comparative exposures. This will give 1, 1½, 2, 4, 8, 16. To give the actual focal equivalents is impossible from his data. He can find this out by measuring the diameters of the stops for himself. However, by multiplying his numbers by 10, and taking the square roots of the results, it gives the following scale: $f/7, f/8.5, f/9.9, f/14, f/19.8, f/28$, which is possibly the correct answer. If not, they will be some multiple of these numbers.—**G. P. VEREKER.**

3801. Platinotype.—You might try A. Garcia, 10, Plaza de San Francisco, Valencia, Spain.—**G. B. C.**

3802. Exposure.—A. R. Wormald, Sutton, Surrey; price 1s. 6d.—**B. DAVIDSON.**

3803. Jersey.—Will find June a grand month for photography in Jersey. Places of interest innumerable. Best consult a local guide after arrival. Could spend a fortnight well. De Faye, photographic chemist, 21, David Place, stocks Ilford plates.—**F. G. D.**

3803. Jersey.—Ilford's can be had from De Faye, chemist, 21, David Place.—**J. H.**

3804. Lens for Hand-Camera.—The distances "M. R." requires can be calculated from the ordinary formula. Let F be the equivalent focus of the lens, d the distance of the object, and l the length from the optical centre of the lens to the ground-glass; then—

$$\frac{1}{d} + \frac{1}{l} = \frac{1}{F},$$

or he will find them calculated out in Gotz's table of conjugate foci (price sixpence). The Optimus 5 by 4 R.E. lens is, I believe, 5½ in. focus; the distance of the object being 5 ft. 11½ ins. (say 6 ft.), the required extension is 5½ in., so a rack or sliding motion of about half an inch would be sufficient. Using a stop of $f/10$, objects at about 25 ft. distance and more would be in practical focus for direct work, the circle of confusion being about 135 in.—**J. G. P. VEREKER.**

3806. Isochromatic Plates.—These have been shown at every exhibition. In portraiture they reduce the coarseness of the features, thus saving an amount of retouching, and for foliage they are certainly the thing. They work well without yellow screen. Like most amateurs, the writer has no prints to send out to show; but experience has proved to him that once tried, satisfaction results.—**EIKO.**

3807. Quinol (Ilford Formula).—Your soda hydrate was evidently at fault. Nothing in the formula itself would account for defect.—**J. H.**

3807. Quinol (Ilford Formula).—Perhaps your chemicals were not pure. Have developed dozens of plates with it, and have not lost any, nor has the developer given out or got faulty.—**EIKO.**

3809. Diaphragms.—Any dealer would make these for you, and it would be preferable to take lens, so that the proper focal value might be marked on the stops. You could, of course, make them,

but it is best to have them made properly and to the recognised standard.—**ERIKO.**

3809. **Diaphragms.**—Of course you can make these yourself; but unless you are a practical hand at it, you had far better have a set made by an optician. Any of the advertising lens makers would cut them for you.—**B. DAVIDSON.**

3810. **Photometer.**—Decoudun's is rather unreliable and indefinite, except that over-exposure is almost a certainty. The principle, however, is of blocking out the light in such a way as to make each circle more and more indistinct. You can generally see a Decoudun's advertised second-hand in the "Sale and Exchange" column for about 4s. It would cost you much more to make.—**ERIKO.**

3810. **Photometer.**—I am afraid "Milly W." would find it very difficult to make a photometer like Decoudun's. It is made apparently by different thicknesses of paper, and afterwards made translucent, probably with Canada balsam. But the varying exposures must be found out by calculation, backed up by experiment. This would require a good deal of skill and experience.—**J. G. P. VEREKER.**

3811. **Plate-Rocker.**—Cut four pieces of strong cord of equal length, fasten one end of each piece to the ceiling, forming an oblong of about 10 ins. by 7 ins. Take a thickish piece of board, of whatever size you may require, and fasten to the ends of the cords. Place dish across, and gently swing it. This makes a very efficient rocker. If a hook be fastened in the board and another in the ceiling, it can readily be put out of the way when not in use.—**HAROLD H.**

3811. **Plate Rocker.**—Get a flat board, and at end attach a rod 2 or 3 ft. long, bendable, which curve, and at bottom fix a weight thereto. Then balance board on a flat piece of lead, bending rod at bottom until board comes level.—**ERIKO.**

3812. **Lens.**—In reply to "Milly W.," I think she would find the lens of the form known as the Eury-scope the most useful all-round lens, as it works at about $f/8$, and is, therefore, useful for portraits, besides ordinary work. If, however, she finds this too expensive, she had better get a rapid rectilinear, working at $f/8$, which is quite rapid enough for ordinary work.—**J. G. P. VEREKER.**

3812. **Lens.**—You cannot do better than to get a rapid rectilinear lens, one of Wray's or Optimus. They are the best you can have for all-round work.—**T. LAKER.**

3812. **Lens.**—I have had the use of Wray's 5 by 4 R.R. (largest stop $f/5.65$), and have found it a splendid instrument for all-round work, and can strongly recommend it to your correspondent "M. W."—**P. K.**

3812. **Lens.**—Rapid rectilinear, Wray, Optimus, Ross's, Dallmeyer's, and Taylor's all good ones.—**ERIKO.**

3812. **Lens.**—A rapid rectilinear is the best lens for all-round work. You cannot do better than get an Optimus.—**B. DAVIDSON.**

3815. **Basket Work Camera Cases.**—The only sort I know of are fishing baskets, and they are rather inconvenient for carrying. I should say that they weigh about the same as leather ones.—**G. B. E.**

3816. **Lantern Slides in India.**—Some time back the above could not be hired in Bombay, but photography and its allies are of such rapid development that an answer can only be given by someone on the spot. Home made photographic slides are much more appreciated by both European and native audiences than the usual type of hired slides. Many missionaries have lanterns and scriptural slides. At soldiers' schools there are also lanterns and slides of various sorts, the latter being usually of historical subjects, and bad at that. I have elsewhere remarked that oxygen and hydrogen cannot be bought in cylinders at Bombay.—**E. F. B.**

3818. **Films.**—I can confidently recommend the washing supports (for the new celluloid roller films), recently brought out by Mr. T. Stanway, Cauldon Road, Hanley, Staffordshire.—**A. P.**

3819. **Brighton.**—Failing anyone else, write to Mr. C. Heth'ton Lewis, of Chiara Studio, 60, Lansdowne Street, Hove, who will give you every help in his power, mentioning my name. The Editor of this paper, in his list of dark-rooms, advertises no less than three dark-rooms at Brighton. Why not write to him?—**W. A. J. CROKE.**

3819. **Brighton.**—Hardcastle, chemist, East Street, has every appliance for photography, and a good stock. Is a gentleman in every way, practical amateur, and would let his dark-room readily. Would also advise you of scenery, etc.—**ERIKO.**

3821. **Watch Camera.**—Perfectly useless. Dark (?) slides, well made but not light-tight. Would lend you mine to try. Address with Editor.—**O. LEAMINGTON.**

3825. **Backed Plates.**—If your own dealer does not keep them, he would get them for you directly. But why not back them yourself? It is very simple.—**W. A. J. CROKE.**

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED. AM. PHOT.**

ST. BERNARD.—The pictures are not published separately; but we shall be pleased to send you an autotype print of "The Children of the City." The framing is purely a matter of taste; white enamelled reeded moulding, $1\frac{1}{2}$ in. wide, makes a very effective frame.

A. H. WEBLING.—The results are not as good as the one we have. We shall be anxious to see them on the screen. Form for "Travelling Studentship" is sent you.

MADGE L. IBBETSON.—We have written to you. **OCTAVIUS STEGGALL.**—The awards were published in the issue of April 18th.

J. W.—The lens A is a cheap one, and imported from France; the mounts may be English. The B lenses are of very good quality, and we believe English. C are the best in the market, and neither of the others are to be compared with them.

J. A. S.—In either of the following cam-ras, which we place in their order of merit, we should advise you to fit R.R. lens—1, 6, 5, 7, 2, 3, 9, 4, 8. Query 1: Certainly not. No. 2: You have named the best, except those of the old form, which are more complicated and expensive.

W. J. PITCHER.—The address is sent. We know nothing of "Batten"; please let us know what he advises.

D. SYDNEY GRAVES.—If you forward stamped addressed envelope, the name and address requested shall be sent you.

WILLIAM JAMISON.—We know nothing of the firm; sorry we cannot help you; write to the Editor of the *British Journal of Photography*.

H. S. OFFICER.—It is difficult to say which of the cameras you name will stand the Australian climate best. A is very handy, and gives good pictures if subjects are well lighted. B is well made, and a useful camera in this country; the maker is a reliable man, and might give special attention to the manufacture of one for Australia. C is quite as bulky as the other of the same kind that you name, and more expensive. E and F are not made to stand the knocking about they are likely to get in your country. We have not seen B since last year, but believe it to be well thought out, and are quite sure that the maker will do his best to build you a camera that will meet your requirements. If you are in London before leaving, we shall be pleased to see you.

D. S. WHITELAW.—It is against our rule to comply with your request. You must give the make of cameras, etc., with letter or number prefixed, and we will advise you which we consider the best.

R. O. GILMORE.—Thank you very much for your appreciative letter. We are always liberal with praise when it is merited. We hope some of your members are entering for our "Travelling Studentship" Competition. Last day for entries, 14th of June.

T. H. R.—We are very pleased with your Ober-netter print of the "Amateur Haymaker," and like it better than the vignettied print at first sent. We shall hope to see your work entered in future competitions.

JOHN PRICE.—We have referred to your communication, and send you the names as requested. Please in future be careful to keep a copy of your letter asking for opinions.

HENRY R. MOISER.—Your note is just what we want for the REPORTER.

CYRIL S. COBB.—Yours dated the 6th from "Gib," did not reach us until Saturday, the 17th inst. Many thanks for MS. Hope you are having a good time. You will see this somewhere.

W. H. KERSEY.—We cannot undertake to forward letters unless stamped envelopes are sent us.

W. A. J. CROKE.—We shall be glad of MS. at your convenience.

T. O. BROADBENT.—The man's name has been added to our Dealers' List, he not being eligible to advertise in "Sale and Exchange" columns.

R. C. B.—We should not advise you to use a W.R. lens; but either an R.R. or portrait combination. You can, of course, try; but we should advise R.R. lens in the following order of make: 6, 5, 3.

W. FENTON JONES.—Thank you for name and address. Will you prospect at Worthing, and advise us of the result.

B.—We prefer the A plate. They are of very first class quality, and we have received no complaints. Your other query has been sent on to the author, who will probably write you direct.

ALIENIST.—The most useful for your purpose will be F, and the next A. We should prefer the former; it is certainly the most unobtrusive, and is quite reliable. You should have a very quick working lens for your purpose, working at $f/8$, or even $f/5\frac{1}{2}$.

J. STEWART PENNINGTON.—We consider B far away the best. It is simplicity itself. (2) The lens is a really good one; almost any speed can be

secured with the shutter; works at $f/8$. (3) Thoroughly. (4) Call and see the camera if you are in town.

G. H.—The term "genre or figure study" is used to denote that the picture is composed and the figures arranged to represent a subject or scene in life. The makers of Pizzighelli paper advertise in the photographic journals, and you will find the address of agents in our columns. We can write you a treatise upon the paper in this column, but you will find a very good account of treatment, etc., in the "Dictionary of Photography," page 134. The photograph you name could be entered in the "Travelling Studentship Competition," provided it complies with the conditions. Your letter shall be sent on to Mr. Leach.

JOHN G. LIVESAY.—Letter and contents noted.

NAGU (ASSAM).—We will write you by next mail. **F. WILLARON.**—Could you give us a call after Whitsun, on a Monday afternoon or Thursday morning?

A. H. MOORE.—Your method would be as simple as any, but using plates without sheaths or slides requires much care. After printing, fix in hypo bath if you cannot wait to tone. B and D.

CHWARELUR.—Nos. 1 and 2 are little better than toys. No. 2 is the best. No. 3 we have never seen.

KENNEDY.—See remarks in "Our Views." Entry for Monthly Competition shall be sent you.

G. R. (CORFU).—Will criticise your prints next week.

J. T. ATKINSON.—Very much obliged. Further "notes" from your pen will be much appreciated. **ENTERPRISE.**—They are none of them A; but the best is probably D, and the next is B.

ST. BERNARD.—We have used A with good result. E is a good maker, although we do not know their cameras. B has some excellent cameras, and any goods of their make you can rely upon. Very glad to see your work at any time.

W. T. ENTWISLE.—We really cannot answer your queries; we have not now the camera by us. The makers can give you all the information you require.

TENNIS RACQUET.—At present we have no "Dark Room" at Herne Bay.

T. STANWAY.—We will notice next week.

MISS M. A. HENDERSON.—Your photograph is included in those acknowledged in this week. The prizes are awarded, and those which have been commended are duly noticed in our columns. It is at present impossible for us to criticise the whole of the photographs. We will look at yours before next week. Your deposit will be quite safe in our hands.

WATKINS.—Thank you. We shall hope to give you a line next week.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or two ds, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Backgrounds.—Two good backgrounds, on rollers, 8 ft. by 6 ft., also 1 lb. iodide potassium; offers wanted in dry-plates or cash. — Knight, 7, Margaret's Terrace, Ilkley, Yorks.

Background on frame, 8 ft. 6 in. by 7 ft. 6 in., plain, fluted oil, and one 6 ft. by 4 ft., on swing-frame; what offers, cash or exchange? — Arthur Hardy, Hartlepool.

Burnisher.—Half-plate burnisher for sale, cheap, only used once, in perfect order; 10s. 6d.—Address, R. Simmons, High Street, Hampton Wick.

Abraham's detective camera, takes 12 plates, changing by lever, rectilinear lens, adjustable shutter; £5.—Apply, E. W. P., 18, Gatcombe Road, Tufnell Park, N.

Harmonium.—Folding harmonium, rosewood case, four stops, double set reeds, three-octave, ex-

change for quarter camera; what offers? — Laker, Queen Street, Deal.

Lenses.—Optimus 7 by 5 R.R. lens, only used a few times; approval.—Address offers, M'Gahery, 19, Waring Street, Belfast.

Ross's portable symmetrical lens, No. 4, 6 in. focus, large stop, 7½ by 4½; £2 17s. 6d.—J. Walker, 132, Lansdowne Road, Didsbury, Manchester.

Suter's f/3.4 aplanatic, 7 in. focus, new, covers whole, cost £3 15s., price 55s.; Lancaster's quarter instantaneous lens, Iris diaphragm and shutter, 14s. 6d.—Summers, jun., 23, Cheapside, London.

I have a splendid half-plate R.R. lens for sale, with Waterhouse diaphragms; cost £3; price 25s.; a bargain; approval with pleasure.—F. Sharpe, Oakham.

Optimus Euryscope, 5 by 4, nearly new, good condition; exchange for Optimus rapid rectilinear, 5 by 4, or sell for 47s.—Pratt, 27, Regent Street, Nottingham.

For sale, an excellent cabinet portrait lens, 18s.; also a 5 by 4 portrait lens, covers well, 15s.; also quarter-plate portrait lens, 15s.; all three second-hand and capable of doing best work; together or separate; chance for beginners; write.—Edwards, Station Road, Manningtree, Essex

For sale, a half-plate R.R. lens, with Waterhouse diaphragms; cost 75s.; will take 40s.; no approval, but prints sent of work done with it.—K., Clarke's Library, Richmond Road, S.W.

Print Washers.—Whirlpool and Rocking Cradle washers, in good condition, also half-plate view lens, cheap — Baxter, Bramley, Leeds.

Rolling Press, etc.—Photographic double geared rolling press, steel plate, 18 by 12, 60s.; half-plate landscape lens and instantaneous shutter, 30s.—G. Jones, Wheelgate, Malton.

Sets.—Would exchange new half International set for Instantograph R.R.—T. Maides, Midhurst.

Wray's 5 by 4 rapid rectilinear lens, new, Lancaster's quarter-plate Instantograph, with stand, Kershaw's pneumatic shutter, new, with changing bag, etc., £3 10s.; lens alone, £2.—R. Ballard, 12, Highbury Terrace, N.

Half-plate Instantograph (Underwood's 1898), one dark slide, tripod, R.R. lens with Iris diaphragm, as new, cost £8, bargain, 75s.—A. Rowe, Wallbridge, Stroud, Gloucestershire.

For sale, Lancaster's quarter-plate Merit camera, in thoroughly good condition, with lens, three double dark-slides, and tripod stand; cost two guineas; will take 25s.—F. W. Sears, 1, Creed Lane, Ludgate Hill.

Meagher's whole-plate bellows camera and five slides, rectilinear lens, solid leather case, stand, etc., £7 10s.; 5 by 4 set, 35s.; cabinet portrait lens, 5s.—Mr. Stewart, 17, Upper Gilmore Place, Edinburgh.

Marion's 5 by 4 camera, lens, two double slides, and tripod, complete, almost new; lot 23s.—Alf. Jeffery, 8, Recovery Street, Leeds.

Exchange quarter plate camera set, nearly new, for good donkey.—Reid, 160, Albert Road, Peckham.

Quarter-plate Kinear camera (by Horne, Thornethwaite, and Wood), long-focus, swing and reversing back, swing and rising front, three double dark-slides, Beck's 7 in. focus Autograph lens, with Iris diaphragms, new, and Newman's shutter, Watson's cyclist stand, waterproof sling case; £5; approval; deposit.—Hubert Henry, 110, Westbourne Terrace, W.

Lancaster's 1889 half-plate Instantograph lens, shutter, double slide, and tripod, perfect condition, very little used; 66s., cash.—W. J. Woods, 67, High Street, Maidstone.

Half-plate camera, with three double slides (by Perkeo, Son, and Rayment), lens, 8 by 5 (by Ross), canvas case, and stand; what offers? or would sell camera and case alone, good as new.—E. C. Brown, 386, Kingsland Road, London, N.E.

The following complete set, owing to owner going abroad:—Park's 1890 Victoria camera, 10 by 8, with three double slides and spring catches, Tylar's covers for slides, stand (by Gotz), Wray's 10 by 8 R.R. with Iris, ditto W.A.R. Thornton-Pickard shutter, Taylor and Hobson's R.V. lens, 10 by 8, Iris (never used); all lenses fit one flange; two cases, also lot of sundries; the lot was quite new a month or two ago; will be sold separately or in lots.—Fur full particulars, apply, F. A. Graham, Albion Stores, Stockton-on-Tees.

Half-plate single extensio camera (by Meagher), as new, three double backs, tripod, carriers, etc.; cost £8 10s.; price £5 10s.—Orme Studio, St. Petersburg Place, Bayswater.

Lancaster's Le Merveilleux 1887 camera, with Hockin's Dissideratum single lens with stops (old lens included), tripod stand, one double back, with canvas bag and straps, the whole in splendid condition; £1 1s.—F. Carter, Waltham Abbey.

Shutter.—For sale, Phantom instantaneous shutter, with pneumatic release; cost 27s.; take 12s. 6d.; fit a hood up to 2½ ins.—F. Sharpe, Oakham.

Slides, etc.—What offers for three Tylar's metal whole-plate double slides, with adapter for Lancaster's cameras, in good condition? — Parritt, 103, Camden Street, N.W.

WANTED.

Backs.—Two half-plate Instantograph backs, cheap.—Emeny, 7, Cadogan Terrace, London, N.E.

Camera, etc.—Half camera and double slides, also

8 by 5 lens, by good maker. — Lea, Athelhampton Dorchester.

Portable half-plate camera and stand, any good make—Baker, Baths, Clevedon.

Watson's Acme whole-plate camera and backs, Beck's R.R. whole-plate lens, with Iris diaphragms.—Gilbery, Room 79, 139, Cannon Street, London.

Camera Case.—Camera case, canvas or leather, cheap, quarter-plate.—G., 127, Manor Street, Clapham.

Dark Slides.—Two dark-slides, half-plate.—Henry Lord, Town Street, Batley Carr.

Lancaster's quarter-plate metal slides.—M. White-side, St. Nicholas, Cardiff.

Three to six half-plate dark-slides, to fit Lancaster's Instantograph; state lowest price.—H. Walker, Winkley Lane, Heckmondwike.

Hand-Cameras.—Hand-camera, Ideal or Rouch's preferred, quarter-plate, also Wray's 5 by 4 R.R. lens, separate, or with camera.—Brotherton, Cullercoats.

Detective or hand-camera, good condition.—F., 31, Beaconsfield Villas, Brighton.

Lenses.—Half-plate wide-angle lens, perfect condition.—G. O. D. Rice, Trinity, Cambridge.

Half-plate wide-angle lens.—Address, Penn, South Castle Street, Liverpool.

Ross's rapid symmetrical lens, 6 by 5, perfect.—C. St. James Villa, Maidenhead.

5 by 4 or half-plate R.R. lens, for cash.—Crossley, Rodley, Leeds.

Sets.—Half camera, all movements, double extension, leather bellows, three double backs, tripod, Underwood's or Lancaster's, must be cheap.—Tims, 4, Heatherside Road, Ewell, Surrey.

Half-plate set, for views, etc., in good order, for cash, must be cheap.—Full particulars to R. Williams, London Villas, Rusperidge, near Newham.

Instantograph half-plate camera, dark-slides, stand, also R.R. lens; exchange lantern (Hughes), 4 in. condensers, 4-wick patent lamp, portrait lens, as new, carrier, two dozen slides; worth 50s, for either, or lantern and 30s. for set.—73, Waterloo Street, Burton-on-Trent.

NORTH MIDDLESEX PHOT. CLUB.—A photographic outing of the above club will be held on Monday, the 26th inst. The members will meet at Paddington Station at 10 a.m., and proceed to Cookham, and work to Maidenhead. Friends and visitors are invited to join.

NATIONAL PHYSICAL RECREATION SOCIETY FOR THE PROMOTION OF PHYSICAL RECREATION AMONG THE WORKING CLASSES.—At a meeting of the Executive Committee of this Society, held at the offices of this Society on Monday last, it was reported that the Royal Agricultural Hall, Islington, had been secured for the purpose of the annual display, which has been fixed for the week commencing Monday, 26th May; and will include mass gymnastics, physical exercises by girls, quarter-staff play, reel dancing, boxing, musical drill, football matches, and a house on fire, with the rescue of the inmates by the Metropolitan Fire Brigade. The arrangements are under the immediate superintendence of Mr. Herbert Gladstone, M.P., Colonel Fox, and the Honorary Secretary, Colonel Onslow.

PLEASURE CRUISES to the LAND of the MIDNIGHT SUN.—The ORIENT COMPANY'S steamships GARONNE (3,876 tons) and CHIMBORAZO (3,847 tons) will make a series of TRIPS to NORWAY during the season, visiting the finest fiords. The dates of departure from London will be as follows, and from Leith two days later:—

June 4th, for 15 days	July 15th, for 15 days
June 18th, for 27 days	July 29th, for 27 days
June 25th, for 15 days	Aug. 8th, for 21 days

The steamers will be navigated through the "Inner lead"—i.e., inside the fringe of islands off the coast of Norway—thus securing smooth water; those of the 18th June and 29th July will proceed to the North Cape, where the sun may be seen above the horizon at midnight. The Garonne and Chimborazo are fitted with electric light, hot and cold baths, etc. Cuisine of the highest order.

Dark Room provided for the use of Photographers. Managers, F. Green and Co., 13, Fenchurch Avenue; Anderson, Anderson, and Co., 5, Fenchurch Avenue, London, E.C. For further particulars apply to the latter firm, or to the West End Agents, Grindlay and Co., 55, Parliament Street, S.W.

Extract from Letter such as we are continually receiving:—

"I will now take the opportunity of saying that all last summer I used one of your "President" Cameras, and although I did some rough work up river and down channel, in all sorts of weather, pouring rain and broiling sun, I have not one fault to find with it.

"In my opinion it is by far the best camera in the market at the price.

"I am, yours truly,

"23, Dale Road, Haverstock Hill, N.W.

GEO. A. A. ADAMS (Yacht Painter)."

THE SENSITIZED OPAL CARD COMPANY, LIMITED, 18, ALPHA ROAD, LONDON, N.W.

OUR VIEWS.

To hold as 'twere the mirror up to nature."—*Shakespeare.*

THE courteous Secretary of the Society of Arts (Mr. H. Trueman Wood) has received at Her Majesty's hands the honour of knighthood, in recognition of the services rendered by him as Secretary of the British Section of the Paris Exhibition. Sir Trueman Wood was the life and soul of the South London Photographic Society, which was dissolved some few years since. He is a member of the Council of the Photographic Society of Great Britain, is one of the few honorary members of the Camera Club, and takes the keenest interest in all photographic matters. His knowledge in many branches, especially photo-mechanical work, is, perhaps, unsurpassed. We are sure that no Birthday honour is more deserved than the knighthood of the Secretary of the Society of Arts.

* * * *

WE have pleasure in announcing that the City Photographic Exhibition will be opened at Drapers' Hall, free, to-morrow (Saturday), and will remain open until the 10th of June. This (Friday) evening a soirée will be given by Sir Albert K. Rollit, LL.D., M.P. (Chairman of the Council). A very distinguished company have been asked to attend. The Exhibition is promoted by the Photographic Section of the Chamber of Commerce, and members of the Chamber may purchase tickets for the soirée at the offices, Botolph House, London, E.C. At present we have no official particulars of the exhibits, but hear from a side wind that the invitation to traders and professional photographers has been freely complied with. Our readers will perhaps remember that this exhibition is entirely confined to the trade, but it is, we hear, probable that an exhibition may be promoted entirely confined to the work of amateur photographers.

* * * *

THE Automatic Photograph (Foreign and Colonial) Company has just been launched, and a prospectus has reached us. The capital is put at £251,000 in 50,000 shares of £5 each and 1,000 founders' shares of £1 each entitled to one half the surplus profits over 15 per cent. in each

year. The prospectus reads on:—"Every allottee of 100 ordinary shares and upwards will be entitled to *subscribe at par* for one founder's share in respect of each one hundred shares allotted." This permission is conceded as a great privilege. Our only experience in founders' shares is in connection with a colliery company, in which the shares were forfeited after trading a very short time; we thought such catch-pennies as "founders' shares" had been played out long enough ago. The price to be paid for the patent rights is absurd, *i.e.*, £500 in founders' shares, £130,000 in cash, and £70,000 (making £200,500) in shares or cash at the option of the Directors. We do not think that many of our readers are likely to invest in either the home or foreign Company, but if they both float, the effect upon the home Company may be very serious, for the foreign Company will, of course, be compelled to manufacture the machines in the country in which they are protected, and will also be able to supply the English market with machines, to the great detriment of, we should think, the home Company. As far as we know, no trouble has been taken to ask a committee of experts to examine the machines or the photographs produced. The Press notices sent out with the prospectuses are of the usual after-champagne-luncheon style, and are valueless from a photographic point of view. A writer in the *British Journal* thus draws attention to the scheme:—"The calculation as to the profit of £31,000, or 31 per cent., is based on their working 365 days in a year, without any allowance for fogs and continued wet weather when people would scarcely go to be taken. The accounts given make no allusion to any means of regulating exposure to the light, which now is different to what it will be at Christmas."

* * * *

THE Tunbridge Wells Society of Arts announce the holding of their first exhibition under very distinguished patronage; the exhibition will include photography. Mr. N. Strange, of 48, High Street, Tunbridge Wells, will furnish further particulars.

LADIES' COMPETITION.—All photographs must be received by Saturday, May 31st, 1890.

OWING to the mass of correspondence we have received *re* Mr. F. D. Bulmer, we are compelled to hold over our article upon his system of business until next week. If any other readers of the AMATEUR PHOTOGRAPHER wish to give their experience, we shall be glad to hear from them not later than Monday morning's post.

* * * *

WE have received from Mr. J. J. Briginshaw, Honorary Secretary of the Photographic Convention, details of excursions, and note that they are proposed to be as follows: Tuesday, June 24th, Conway, Bettws-y-coed, and Moreton Old Hall; Wednesday, the 25th, Eaton Hall; Thursday, the 26th, Vale of Llangollen; Friday, the 27th, Royal Mersey Yacht Regatta, and Hawarden. Permissions to photograph have been given—by the Dean of Chester, to photograph the Cathedral and precincts; the Duke of Westminster, Eaton Hall, interior and exterior; Rev. S. Cooper Scott, St. John's Church and ruins; the Hon. W. H. Gladstone, M.P., Hawarden Castle and park. This very brief synopsis will give some idea of the outdoor work members of the Convention will have the opportunity of doing. The subscription to the Convention is very small, and we are sure that no one interested in photography will grudge the few shillings for which so many privileges are conceded.

* * * *

PROFESSOR MELDOLA delivered an interesting discourse at the Royal Institution recently, on the subject of "The Photographic Image." He dealt with the chemical questions which had arisen during the progress of photography, from the time of Daguerre downwards. He devoted some considerable portion of the time to silver and its action under light, but he pointed out that even now, after much time had been given to the study of the subject, there were many points which were a puzzle to the chemist.

* * * *

Scribner's Magazine is always interesting, but the June issue is especially so, as it contains an article by Mr. Henry M. Stanley, on "The Emin Pasha Relief Expedition," illustrated with reproductions from photographs made by members of the Expedition. The frontispiece, a portrait of Mr. Stanley, is from a photograph taken at Cairo in March, 1890; another excellent illustration is that of Stanley, Nelson, Emin, Casati, Jephson, Stairs, Bonny, and Parke, from a photograph taken at Urambiro. Perhaps the most interesting is the group of Wambutti dwarfs—the first ever photographed. Of these Mr. Stanley writes: "Scattered among the Balesse, between Ipoto and Mount Pisgah, and inhabiting the land situated between the Nzaiu and Ituri rivers, a region equal in area to about two-thirds of Scotland, are the Wambutti, variously called Batwa, Akker, and Bazangu. These people are undersized nomads, dwarfs, and pygmies, who live in the uncleared virgin forest and support themselves on game, which they are very expert in catching. They vary in height from three feet to four feet six inches. A full-grown male adult may weigh ninety pounds." In order to show the stunted growth of these dwarfs, they are posed in front of some of the native carriers who accompanied the Expedition.

WE shall be pleased to receive short articles descriptive of "Holiday Resorts and Photographic Haunts," especially short accounts of districts in and around large towns where good work for the camera may be found. These articles should not contain less than 500 words or more than 1,000. In every case a proof will be sent to the author for revision, and, if desired, a few slip proofs for distribution.

* * * *

As there is a considerable amount of clerical work entailed in sending out letters of introduction, etc., for dark-rooms, we must ask that all applications be endorsed "Dark-Rooms," in order that the letters may be attended to by the clerk especially told off for that purpose.

* * * *

THE photographs entered for the AMATEUR PHOTOGRAPHER "First Ladies' Competition" will be judged on the 12th of June, by ladies, at the Hotel Métropole. We have every reason to hope that Mrs. Eveleen Myers, the accomplished photographer, will honour us by giving her services. Two lady artists, who have not yet been secured, will assist her, and we are hopeful that arrangements may be made to show the pictures either after the adjudication on the 12th, or on the 13th. If this can be arranged, due notice will be given in next week's issue, and invitations sent out to competitors and others.

* * * *

WE would remind our subscribers who intend to enter for the "Travelling Studentship Competition" that we shall be glad to receive their pictures as early as possible, in order that the work of classification and registration may be proceeded with. We publish particulars of the competition on the inside of back page of cover. Entry forms, declarations, etc., will be sent at once upon application.

* * * *

MR. PETER MACNAB, who is well known as an artist and a writer, has consented to contribute an article to the July number of the PHOTOGRAPHIC QUARTERLY, entitled "Is Art Indebted to Photography?" Other articles already arranged for are "A Plea for Systematic and Associated Photographic Work," by the Rev. T. Perkins, M.A.; "Some Points in Connection with Light and Photography," by Mr. T. R. Dallmeyer; "Photography in Natural Colours," by Mr. F. Bligh Bond; "Photography during a Tour in Egypt" (illustrated), by Major J. Fortuné Nott; "Portraiture and Journalism," by Charles E. Pearce, etc., etc. The frontispiece will be a reproduction by an entirely new process of a photograph of the Sphinx, taken by Major Nott whilst on tour in Egypt. The foregoing will show that the standard reached will be maintained. We are pleased to be in a position to state that Mr. Jerome K. Jerome, the gifted author of "Idle Thoughts of an Idle Fellow," etc., has promised us an essay, but it will not appear before October, or possibly not till the January issue.

* * * *

THE GROSVENOR GALLERY.

THERE seems to have been a supposition abroad that this year's Grosvenor would not be a success. That supposition has happily not been realised, and we think that although

this popular exhibition has lost, of late years, much of the definite teaching which once characterised it, it has gained a wider sympathy, and appeals to an ever-increasing circle of the art-loving public. It is no longer didactic, yet it has not ceased to be instructive. Whatever particular style of painting may be admired by the visitor, he is sure to find something that will appeal to his special taste. Is he an admirer of the school of Mr. Whistler? Then let him turn to Mr. Stott's work, "Soft Winds" (No. 11), and "Diana—Twilight and Dawn" (No. 190). Why the title of the first has been chosen, it is difficult to see. However, the colouring is at any rate attractive, the rendering of the clouds being the best part. We do not think that a photographer could profit much by the lines of composition in 190, yet it has an originality all its own. If strange and startling eccentricities, where the artist strives to create a new heaven and a new earth out of his own fanciful brain, be sought, let the visitor turn to Nos. 120 and 128, by Mr. Millie Dow; if he hanker after the Academicians (who, however, do not assemble in any considerable force), he will find an admirable portrait of Orchardson by himself, and Mr. Pettie has produced a really excellent work in No. 115. No. 19, too, is an original subject. Mr. Moore's "Sand-laden Surf" (No. 63), although the breaking wave on the far right is not quite successfully rendered, is a subtly telling sea piece; and No. 263, a seaside sketch, by Willie, shows him at his best. If anyone is more fond of the modern school, whose eyes see and whose hands translate on to the canvas principally the soft greys of nature's colouring, then let him contemplate at his leisure the dim beauties of Mr. Halswell's "Early Moonrise, Venice" (186), or "Oporto," by Hemy (174), where, however, we must stop to find fault with the perspective, for either the trees at the right-hand bottom corner ought to have been very much larger in proportion to the rest of the composition, or else they should not have been introduced at all. Then there are Mr. Priestman's broad sketches, with their superabundance of foreground—No. 6, for instance—but No. 13 is more successful, the subject suiting this particular style of painting better (though, for all that, the artist would be more truthful if he suited his style to his subject, rather than his subject to his style). The grey sea or ship scenes of Mr. Brangwyn are always charming, because one knows so well, in nature, that grey look in sea and sky, reflected on all surrounding objects, which characterises bad weather on the ocean (No. 219). No. 45, by the same artist, is a genre picture of great merit, representing a group of sailors discussing the news over their "beer and baccy." The lines of composition are admirable, though there is some little mistake noticeable in the drawing of the left hand of the sailor on the far right. If the visitor desires to study the "strong colour" school, he has Mr. Melville's "Audrey and her Goats" (109), where everything is sacrificed to paint—another illustration of the evils of eccentricity carried to extremes.

Of other pictures we would point to No. 4, with respect to which we question the accuracy of the painting of the road, with its down-hill appearance. No. 26, a shrimp catcher examining his net as he stands in the sea, which breaks in little ripples on a sandy shore, while a fishing boat lies anchored in the middle distance, and trawlers stand out upon the horizon under a grey canopy of sky, is a telling picture from which there is much to be learnt. No. 51 marks a study of French work. In No. 61 notice

the inaccurate drawing of the white horse. In No. 66 the idea of shade under the trees is well brought out. No. 68, a lioness suckling her cubs, entitled "Maternity," is one of the pictures that would serve to redeem the Exhibition from the charge of commonplaceness. It is seldom one sees so truthful a representation of animal life; the expression of contentment mingled with watchfulness is most admirably conveyed by the pose of the head and glance of the eyes in the recumbent beast. No. 82, "Light of Light," is clever and full of religious feeling. No. 92 is pretentious, but fails to be a success; if the sea was really so rough as it is painted, it would be dashing over the pier every instant, and nobody could stand there; moreover, why is the dog introduced? No. 93 is attractive and rather after the Barbizon school. Of No. 102, Sir Coutts Lindsay's picture, the less said the better. In No. 129, a Venetian sketch—the bores of the Galleries, as Venetian pictures are often dubbed—it is refreshing to find in the foreground a boat that is not a gondola. In 149 there is a good grouping arrangement. 173 is a gorgeous Byzantine piece of painting; 185 is clever; in 196 notice the entire absence of shadows, which would be impossible on a day so apparently bright. No. 203 is a good portrait, and No. 220, by Nelson Dawson, must not on any account be missed; it is a pity that such a clever picture should be skied.

The Director (Sir Coutts Lindsay) has hung several pictures on the stairs this year—a draughty place to view them from. The best is No. 379, altogether one of the most striking pictures exhibited, and reminds one of some of Vertschagin's work. It is entitled "Sevastapool," and represents a priest reading the burial service over a trench in which are innumerable bodies of slain soldiers; the ground is covered with snow, and in the distance stand a body of troops. No. 242 is a suggestive piece of work, and Nos. 333, 346, 371, and 372 are worth a glance.

But the gems of the Exhibition are Mr. David Murray's landscapes, Nos. 59, 71, 181, and 192. In 71, "Sundown," he is hardly at his best, but 192, "A Summer Breeze," suits him better; the stirring of the elder bushes is almost apparent. In Nos. 59 and 181 we see this artist really in his element; 59 represents some sheep browsing amongst high-growing greenery in a field, with a distant village, nestling amid the trees, and a lowering sky. It is instructive to compare this with No. 55, by Guthrie, a picture in which the artist relies entirely on the broadest rendering of his subject without the least attention to detail, whilst Murray manages to introduce just that amount of elaboration of detail which is sufficiently accurate to convey his meaning. Constable has said that "a servile imitation of every detail in nature is fatal in painting landscape; the painting of a tree may be too good, it may be made so good that it becomes good for nothing." We may conclude also that if it be merely a blotch, it will not be a tree at all. Guthrie falls into the blotchy error, Murray preserves the happy mean. Here is a lesson for the advocates of the smallest stop, on one hand, and the largest, on the other. Let us learn from Mr. Murray to adopt the happy mean. No. 181 is a large and more pretentious composition; the bright summer evening is skilfully managed, and the whole scene is fully worthy of this rising artist's reputation. He always has a lesson for landscape photographers. Let the reader go and study his four works at the Grosvenor.

Letters to the Editor.

PHOTOGRAPHING ABROAD.

SIR,—Perhaps the following notes of a three months' tour abroad last spring (1889) may be useful to some of your readers, especially as I see queries sometimes asked, whether it is desirable to develop or not on the journey, and in this case I did so. I took notes at the time, thinking that one day or other they might be useful to my brother amateurs, in your columns. My outfit consisted of a quarter-plate camera, six double backs, my lens was a 5 by 4 Wray rapid rectilinear, some four or five dozen Thomas plates, a couple of packets celluloid films, a bottle of the London Stereoscopic Company's hydroquinone developer, a box of Eastman's developing powders (all of which pleased me much, a pound of hypo in a tin (I should by rights have taken more, for I had to buy some in Rome, where they charged me a franc a pound), two developing trays, a four-ounce glass measure, portable lantern (I bought candles as I went on), a few sheets of ruby paper, and some elastic bands, all of which I carried in a canvass bag with strap handles, that opened out like a pocket-book, having pockets on either side, and also an outside pocket with straps at each end, so that I could sling my camera legs through, and I had also a black bag with strap handle, useful on journeys for carrying guide-books, etc., and which I used, whilst stopping in a place, to carry my camera, etc.

We left England the middle of March, our first stopping place being San Raphael, a nice little seaport town on the Riviera, about thirty miles west of Cannes, a place full of interest to the photographer, for on one side was the little port and harbour, and on the other the Esterelle Hills, with fine groves almost down to the sea, and also the luxuriant foliage of the Riviera, and presenting everywhere lovely bits. Not far from San Raphael and within easy walking distance is Frejus, an old Roman town with the remains of a large amphitheatre and aqueduct; and Treport, a quaint little port (which, however, we did not visit) not far off, and whilst we were there a branch railway between the two places was opened. I have dwelt somewhat lengthily upon San Raphael, for it does not seem so well known as it should be, and to any one who requires rest and change, and yet does not care to go to the more fashionable places on the Riviera, and yet wants something to interest them, San Raphael would be the very place, added to which the charges were moderate at the hotel we stayed at, and we also found the same as regards carriage hire, etc. I found, close to the cathedral a photographer, M. Ferrari, who had a branch establishment at Nice, and who very kindly developed some dry plates at a moderate charge, and said he would be glad to do so for amateurs.

From San Raphael we went to Cannes. There I found a most obliging photographer, "Photographie Buisson," 12, Boulevard de la Croisette, close to the post-office and on the Plage, who also developed for me, and allowed me the use of his dark-room, and will be glad to do the like for other amateurs. There are two shops in Cannes where you can buy photographic materials, one in the old town in the Rue Frejus, and the other, De Bray, in a short street on the left hand just off the Rue des Antibes (the principal main street). The attractions of Cannes are so well known that I will not dilate upon them, but here I found the advantage of taking your camera, for, wishing to get some views of Pegomas, a pretty village some six miles off, where I took some views, although I hunted all round Cannes, I could not get any.

At Mentone, M. An. Fosse, rue Partoneux, near the post-office, will develop for you and supply photo materials; at San Remo, J. Scott, 16, Rue Victor Emmanuel, will develop for amateurs; at Sienna there is a photographer, whose name I forget, but whose studio is close to the Piazza de Signiora, and up some three or four pairs of stairs, who will develop for you.

In Rome you can purchase English plates and materials of Mr. J. Juliana, 147, Via Babuino, close to the English church, and who will tell you where you can get your photographs developed; and there are two or three shops in the Corso where you can get plates and materials, and the same applies to a large shop in the Via Nazionale, not far from the Quirinal Hotel.

In Vienna, Oskar Cramer, The Graben, one of the principal shopping streets, and not far from the Cathedral (St. Stephano), will develop for you, and you can get materials, and also at a shop opposite, but I could not get English plates—possibly they were out of stock.

In Prague, Mr. Adolf Fische, 23, Ferdinand Strasse, had Lancaster's cameras (and I think plates), and will be very glad to develop for you or to be of service to you.

In Dresden, Mr. Ernest Kessler, 3 and 4, Britestrasse, near the post-office, sells photographic materials, and will develop for you.

In Berlin, I am told, there are excellent shops where you can buy English plates and apparatus, and where they will develop for you, but our time was too short to make full inquiries.

We also visited Spezzia, Perugia, Bologna, Ravenna, Padua, Venice, and Gratz (the latter an extremely pretty city between Vienna and Venice), and where most beautiful views of the district can be purchased, and I have little doubt that at all these places, and also at Pressburg, a quaint little city on the Danube, about forty miles south of Vienna, the photographers there would develop for amateurs, but the places I have mentioned before in detail came under my special notice.

I regret extremely that my very imperfect acquaintance with foreign languages has prevented me from obtaining much valuable information which I found our foreign *confreres* were always ready to impart, and I most strongly urge upon all your readers who may be thinking of following my example the very great importance of knowing as many languages as possible, or at any rate French; but failing this, it would be of very great service if some one would compile a little hand-book with a few useful phrases in French, German, and Italian, and I subjoin a few which in my opinion would be useful:—

PHRASES REFERRED TO.—*At a photographer's:* Have you any English plates? What makers—sizes? Will you develop my plates (or prints) for me? How much apiece (or dozen)? When will they be ready? Can they be ready (at 11 to-morrow)? Can I use your dark-room? What developer do you use? Is there a photographic society in the town; if so, who is the president or secretary? What is the principal object of interest to photograph? Where can I get permission? What time of day should it be taken? Have you any pyro, or hypo, etc., etc.? How much a pound, or ounce. *In the Street:* Is this the way to —? How far is it? *At the Place:* Will you have the kindness to allow me to photograph? Please get out of my way for a few minutes. Now be off, you boys, don't pester me! *At the Custom House:* These are photographic plates only. Please open only in a red light.

Although it may be a great bother taking your camera with you, especially if you take your own developing materials also, even with my increased experience I would do it again, and I am sure it vastly increases the pleasures of a tour to do so. I never found the slightest difficulty in developing in hotels; you have this great advantage, you know what you are doing as you go on, and thus many a picture you would be very sorry to miss can be retaken if necessary, and also if your plates are exposed you can effectually prevent any custom-house difficulty, and whilst at Vienna I got prints in duplicate from several of my best negatives, and thus prevented the risk of any breakage, and thus losing the results of one's labour.

With regard to films, I like them very much, but I did not care to risk using more than a few, but before I go abroad again I mean to use them pretty freely, so as to get accustomed to them, for I am convinced if they can be made as good as glass, they will be an immense boon to the traveller, and there will be this advantage, you can enclose the negatives in letters home, to be developed there if necessary, or better still, if you develop as you go on, and enclose them home in letters, what a new interest they may add to one's letters home.

I very much regretted I had not with me a hand-camera. Most people are acquainted with views of the great Continental cities, etc., but it is just those little bits of places or architecture, or the scenery or the usual incidents of life (take a railway station or a market with its crowds of people, for instance) that one wants to take, and here a hand-camera comes in so useful.

From all classes I met with the most courteous treatment. Of course, when I put up my camera a small crowd usually gathered, and the small boy and the loafer is the same all the world over, but I never was at all hindered, but, on the contrary, either pretty views were pointed out, or little courtesies shown; and here again I found how valuable it would be to have known the language, instead of the mixture of French, Italian, and Yorkshire, and signs one was reduced to. I never had the least difficulty at the Custom House either abroad or coming home.

From my inquiries I found that the bulk of foreign photographers use ferrous oxalate, and a few use a pyro developer, but I did not hear of any using hydroquinone.

This outing was the first I had ever taken with my camera abroad, and if some of your readers follow my example and have as much pleasure as I did, they will not repent it.—Yours faithfully,
Selby, 17th May, 1890. J. T. ATKINSON.

* * * *

KODAK CAMERAS AND LENSES.

SIR,—Mr. F. T. Norris has had the courtesy to send me a copy of his reply to my last week's communication to you, which reply I suppose will be published in this week's issue of the AMATEUR PHOTOGRAPHER. In this reply, Mr. Norris returns to the attack upon Kodak lenses with what appears at first glance to be admirable courage, but which will appear upon more careful reading to be a studied dodging of important data.

I understand that Mr. Norris in his original communication made this specific statement, that "the Kodak and some other hand-cameras have no more expensive a lens than a single non-achromatic, objective, costing, first cost, about sixpence each."

This statement exhibits plainly two facts, which are of the utmost importance in estimating the value of Mr. Norris' information or opinions upon photographic matters—

(1) It proves that at the time he made the statement referred to, he did not know what the construction of the No. 1 Kodak lens was.

(2) That he considered the mere fact of a non-achromatic photographic objective working at fixed focus a vital fault. Both prove that he is one of those critics described in my last communication to you, who rush into print upon matters with which they have no accurate practical, or for that matter, theoretical, knowledge, and still worse, that he had no compunctions of conscience or considerations of ordinary fairness to prevent him from making a deliberate mis-statement concerning the cost of an article of the construction of which he was absolutely ignorant.

In his last communication Mr. Norris entirely evades the one vital point when he says "that sufficiently deep meniscus or periscopic lenses able to do very similar work to those of the Kodak can be bought at," etc., etc.

The difficulty, however, is not to make one lens of indefinite focus, or for that matter one hundred lenses of varying foci, which might be used in cameras capable of adjustment to their special requirements, but to produce a large number of lenses of little or no variation in focus which can be used in a camera not capable of adjustment.

The size of the No. 1 Kodak, notwithstanding the adverse opinion of some persons, is one of the most important features contributing to its unparalleled success. To increase its size in any way would shut out thousands of purchasers who would not be tempted to carry anything larger.

Further, can it be possible that Mr. Norris does not know that a lens working at fixed focus need not be achromatised, and that the reason why watches can be and are made so well and cheaply is simply because they are so commonly used that the demand warrants the use of machinery of such value that no photographic enterprise can for one moment be compared to it?

Viewed from a purely business standpoint, Mr. Norris' arguments must strike my fellow manufacturers of photographic apparatus with a strange mixture of despair and envy—despair, that with all the ingenuity, skill, and patience evinced in the great number of hand-cameras which are now offered publicly from a value of 5s. upwards, there is still a dissatisfied and irreconcilable faction who want something cheaper—envy, that after much study, investigation, and special business experience, we have all lived to learn from a novice that our very specialties can be produced for a tithe of what we thought them well worth.

But for fear that such an opportunity may not occur again, I want to contract with Mr. Norris for the delivery of 1,000 pairs of lenses of the same quality as those used in the No. 1 Kodak at the price he mentions they may be produced at, namely, three-pence. The only conditions I impose are that they shall fit the standard Kodak tube, and be subject to the same test which all these lenses undergo at our hands, the negatives of which are on file at our works.

We hope Mr. Norris will have the courage of his convictions.—
Yours truly,
May 21st, 1890. WILLIAM H. WALKER.

SIR,—In your issue of the 23rd inst. I read with pleasure a letter by F. T. Norris, in which he speaks of the price of deep meniscus or periscopic lenses. If that gentleman would kindly inform the readers of your valuable paper the address of some firm where such lenses can be obtained at about the price he mentions, I am sure such information would be gladly accepted by many, who, in making their own cameras, would be in want of the simple lens, without going to the extra expense of purchasing one elaborately mounted, thereby very much increasing the outlay. I suppose such lenses would give a sharp definition, otherwise they would not be of much use.—I am, etc.,

HIERONYMUS.

* * * *

INEXPENSIVE HAND-CAMERAS.

SIR,—I am glad to see that my letter of the 9th has brought forth such practical replies as those of your correspondents "T. D." and "S. E. K." By a curious coincidence, in the same number of the AMATEUR PHOTOGRAPHER in which my letter appeared is an illustrated article descriptive of a new camera, circular in form, the shape I advocated, and which is certainly the best. But another coincidence this week's journal contains three advertisements of newly-devised hand-cameras at very reduced prices. But very much more in the way of lowering charges must be effected before a fair figure is reached that allows a reasonable margin of profit to the manufacturer. I maintain that the present prices of lenses and cameras are out of all proportion to the cost of production, and when this is generally known (as I trust it soon will be), one of the chief of the many burdens that oppress the long-suffering amateur will be removed.

Turning to your third correspondent, Mr. William H. Walker, who writes in reply to remarks of Mr. Norris, Mr. Davies, and myself, I would explain that, far from finding fault with the Kodak, I have the highest opinion of it. For over two years I have constantly used one in my many wanderings in Europe and Africa, and have always found it work wonderfully well. I have taken over 300 photographs with it, and out of the last 100 films got ninety good negatives. My complaint lay not with the instrument, but with its absurdly high price. Mr. William H. Walker, in his unintentionally amusing, though unnecessarily peevish reply, with true American ingenuity has managed to advertise and parade the wonders and numbers of the different kinds of Kodak, though modestly omitting to mention the large prices these same Kodaks are sold for. Mr. William H. Walker's dissertation on the educational advantages of a German University career is interesting, if entirely inaccurate and beside the question. While denying Mr. Norris's statement that sixpence is the *exact* cost of the Kodak No. 1 lens, Mr. William H. Walker, with laudable discretion, carefully avoids saying how many fractions of a shilling Mr. Norris is wrong in his estimate. It would, moreover, be extremely interesting if Mr. William H. Walker would furnish a waiting world with a few details of the meaning of his sentence beginning, "The Eastman Company gave *carte blanche* to two of the most respected and successful makers of photographic objectives in Great Britain," etc. The novelty of a commercial company offering open terms to foreign producers for goods, and especially stipulating that those goods should be superior to its own, is most refreshing and certainly peculiar. The subject would prove of exceptional interest to the student of racial characteristics when it is remembered that this magnanimous and disinterested offer was made by an American firm. For a transatlantic tradesman to refuse voluntarily to settle terms when giving out an order is a species of originality that must be unique even in the States—a country where originality is seen at its best, and where imitation is perfected to a fine art. But probably in the misty mazes of French words, German universities, and the comparative merits of European and American manufactures, Mr. William H. Walker has got a little beyond his accustomed tether. The connection between his business occupation and the wide fields of science, education, and trade in which he wanders airily in his letter, is certainly not obvious. To a gentleman of Mr. William H. Walker's encyclopædic knowledge it may seem presumptuous to offer advice. In fear and trembling I may, however, suggest *Ne sutor ultra crepidam* to his serious attention. In conclusion, I would further humbly ask of Mr. William H. Walker, when he has leisure from his Napoleonic responsibilities in connection with the Eastman Company, to furnish your readers with a plain answer to a simple

question—What is the actual cost of production of a Kodak (No. 1) lens, and what is the actual cost of production of a finished Kodak (No. 1) that is sold for £5 5s. 2—1 am, etc.,

Trieste, May 20th, 1890.

F. G. B.

* * * *

THE INTRODUCTION OF BROMIDE INTO THE DEVELOPER.

SIR,—I trust that little apology is necessary for bringing forward a subject which must be of great interest to all connected with photography; I refer to the method of introducing the restrainer into the pyro-ammonia developer.

In the first place, everyone who has used this developer knows how liable a plate is to fog in the absence or deficiency of "bromide," while we can altogether dispense with it in the pyro-potash developer. Now, most amateurs have introduced their bromide of ammonium or potassium into the ammonia. But, in my opinion, it is a great mistake to thus mix restrainer and accelerator in one solution. It surely bears a remarkable resemblance to the mad engineer, who invented a locomotive so constructed that augmentation of steam pressure produced a corresponding increased power on the brake. In the case of photography it is not so bad as that. An increase of ammonia solution does produce some acceleration; but how much greater if the restrainer were removed. Think too of the economy.

But besides the above-mentioned disadvantage, the association of bromide and ammonia in one solution produces in time a result that I have not before seen published. It is well known that every opening of the ammonia bottle allows the gas in some measure to escape and to diminish the potency of the liquid. But, be it remembered, the restrainer has not decreased *pari passu* with the power of the accelerator. Hence, little by little the ammonia solution is losing strength, while the amateur is losing courage, being at a loss to explain the reason of having to use such an inordinate amount of accelerator. He puts it down to under-exposure, goes to the other extreme, and over-exposures; thus photography is so difficult! For these reasons it is far more suitable to mix the bromide *separately* in a 10 per cent. solution, and using therefrom the quantity determined by the plate makers requisite for their plates; thus will he effect a considerable saving in chemicals, adopt a more truly scientific developer, and undoubtedly diminish the chances of his failing.—Yours, etc.

C. S. M.

* * * *

PHOTOGRAPHIC SOCIETY FOR RICHMOND.

SIR,—As far as I can ascertain, there is no photographic society in Richmond or the neighbourhood. As there are, without doubt, many amateurs residing here, perhaps these lines in the AMATEUR PHOTOGRAPHER may be the means of starting such a Society, which I should think would find many supporters.—I am, yours faithfully,

E. G. RICHARDSON.

20, Hermitage Villas, Richmond, Surrey.

May 27th, 1890.

THE CRYSTAL PALACE AWARDS.

SIR,—In your issue of May 23rd, p. 368, I notice a statement that *all* the medals have been forwarded to the prize winners at the recent Crystal Palace Exhibition, but I fancy you must have been somewhat misinformed. Two medals were awarded to me, one for photo-micrographs, and another for microscopic lantern slides, two distinct classes, of course; but *one* medal only has been sent me, with an inscription on the rim stating that it is the medal awarded in class C, sec. 3, and class A, D, sec. 10. I have explained to the managers that this hardly agrees with my idea of getting *two* medals, and have informed them that my opinion is that I have a distinct claim to another separate medal. Therefore, as far as I am concerned, the statement quoted above would be quite correct were it to run, "*All the medals but one have been forwarded*," etc.—Yours faithfully,

ARTHUR A. CARNELL.

Bedford Villa, Plymouth, May 27th, 1890.

THE "PHOTOGRAPHIC QUARTERLY."—A correspondent in Dublin writes, "May I say a word of congratulation on the PHOTOGRAPHIC QUARTERLY, to which I look forward with great pleasure. Its publication gives quite a new dignity to photographic journalism."

The Complete Photographer;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

By H. P. ROBINSON.

CHAPTER XI.

Printing. Platinotype. Silver.

PHOTOGRAPHER.—I presume that you will print almost entirely in platinotype, or some other of the matt-surface processes, which are much more artistic than anything that can be done on an albumenised or any other glazed surface. Silver printing has been often doomed, but is not yet played out, although I think that in the future its use will be confined almost entirely to professional purposes. For one thing, platinotype is much easier and more simple than silver printing; it is more speedily done, and free from many of the perplexities and pitfalls that occur in the older method. It has one apparently great difficulty, which, however, vanishes with better acquaintance—it is a development process, and the depth of printing is not visible until it is finished; but half the care, attention, and observation that are necessary for successful silver printing will conquer the apparently difficult task of judging correctly when a print has been sufficiently exposed.

I don't care to weary you on any subject that has been previously well and simply done, and not lost in the fog of many words, and the directions supplied by the Platinotype Company are so clear, precise, and—greatest merit of all—short, that I cannot improve on them; and other platinum processes have been ably described in Mr. Lyonel Clark's little volume on "Platinum Toning;"* but you want to see me go through the processes I practice, so I must not omit this one. Besides, who knows? I may vary minutely, as is orthodox in great inventors, from the Company's directions. As for the other platinum processes, I can only recommend you to read Mr. Clark's book, and also to procure the materials supplied for his own excellent process by Mr. Blanchard, and follow his directions.

What is called the hot-bath process of platinotype is the one I prefer, probably because it is the oldest, and I have had more experience with it than the others, and that is the one I shall take you through.

Platinotype paper can be obtained cut to suitable sizes and is of several qualities. For sizes 10 by 8 and upwards I prefer C paper, which is thick and strong, and has a rather rough surface. For smaller work a smoother paper seems desirable; the distinguishing mark of this kind is A. The printing is done in the usual manner in a pressure frame, and as it is absolutely necessary to keep the paper dry, vulcanized rubber pads are used. The colour of the coated paper is a bright lemon-yellow. It must be remembered that it is much more sensitive to light than albumenised silver paper, and will not bear the reckless exposure before printing that is so common with silver printers. Your first print, until you have acquired skill in judging, must be an experimental one. If your negative is such as those we developed, with the darks represented by bare glass, and the whole plate full of gradations, and if also the light is good, we may expose the frame from 30 to 45 minutes.

PUPIL.—Shall we give it the longer time, to show we are not impatient?

PHOTOGRAPHER.—The time being up, we will lift the half-back of the frame and examine the print in a dim light.

* "Platinum Toning," by Lyonel Clark. London: Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill, E.C.

The darks are rather strongly marked in grey, and the rest of the picture, except the lightest gradations, can be faintly seen. We will develop it at once. The developer is made by dissolving 1 lb. of oxalate of potash in 54 ozs. of water, practically a saturated solution. It has now to be made hot. For this small size we will use an enamelled iron dish. For larger sizes I use a trough of the same material, in which the print, weighted down with a heavy glass rod, is easily drawn through the liquid.

We now put the dish of developer on a tripod over the flame of a Bunsen burner, and heat the liquid to 150 degs., which we ascertain with a thermometer. I now float the printed surface of the paper, carefully avoiding air bubbles, for 5 or 6 seconds, and at once throw it, face downwards, into a dish containing a weak solution of hydrochloric acid—the proportion 1 oz. of acid to 60 ozs. of water. It will remain there 10 minutes, and two similar baths of fresh acid will follow; meanwhile, we may look at it.

PUPIL.—A good print, but rather too dark.

PHOTOGRAPHER.—You are right. Mark the negative "35 m.," which means that in a good light, which you must learn as a standard, the negative will take 35 minutes, if developed at a temperature of 150 degs.; it will then be easy for you to judge how much more it will require in a dull light. If, however, you had other similarly over-exposed prints, and if the temperature was allowed to fall to about 140 degs., they would probably be right. If under-exposed, raising the temperature to 180 degs. may be resorted to, and within this limit, the higher the temperature the better the colour.

PUPIL.—I am glad you have mentioned the colour; I have always thought platinotypes too cold.

PHOTOGRAPHER.—That has greatly improved lately. I think the C paper gives a better black than the others. I will now show you how to get a warmer black. I have provided other prints to develop. The dish contains about 20 ozs. of developer. To this we will add half an ounce of saturated solution of bi-chloride of mercury. We again raise the temperature to 150 degs., and develop another print. After leaving it in the acid bath a few minutes, we compare it with the first print, and find that although we obtained a fine black in No. 1, the second is warmer and more agreeable in colour. I was first told of this improvement by Mr. Wilson Noble, but it was also arrived at independently by Ralph W. Robinson, in a curious series of experiments, which reminded me of Charles Lamb's Chinaman burning down his house so that he may enjoy the luxury of roast pig.

The prints are now fixed, and only require washing for a quarter of an hour in several changes of water.

PUPIL.—Nothing could be simpler or apparently easier than platinotype printing, and I think I shall in practice not complicate it with any other; but I should just like a glimpse at the older process.

PHOTOGRAPHER.—Silver printing need not occupy much of our attention, but I will briefly run through it.

Buy your paper ready sensitised, avoiding the double albumenised. There are many good makes in the market. Print rather darker than you would have the finished print. Wash the prints at least 20 minutes, moving them about, in three or four changes of water. In cold weather keep the water and all the solutions up to at least 60 degs. Tone in the following bath:—

Borax	..	..	..	..	5 drms.
Water	..	..	..	..	3 pints.

Add chloride of gold in the proportion of $1\frac{1}{2}$ grains to each full sheet of paper (23 by 17). There are many varieties of toning bath, the most popular of which is the acetate of soda; but I much prefer borax. Many of the other baths

give a purple tone, which is anything but artistic; with borax you get a variety of brown tones down to black, which are much more agreeable. It is usual to direct that this bath should be thrown away after once using, but it will keep good and tone well for five or six times—fresh gold being added—when it becomes of a dark purple and the prints are not so rich. It is well to be liberal with the gold; a quickly toned print is brighter than one that has soaked in the bath for a time, and there is nothing wasted, for it is easy to save gold residues. When the gold is exhausted, the prints you attempt to tone become a dirty brown and lose brilliancy. The addition of fresh gold at this stage helps the tone, but does not restore the freshness of prints that have been any considerable time in a solution of borax deficient in gold.

The prints, as they are toned, should be put into a dish of water until all are done, when they must be fixed in

Hyposulphite of soda	..	..	..	3 ozs.
Water	..	..	..	1 pint
Ammonia	..	..	..	10 minims.
Methylated spirit	..	..	..	1 oz.

The ammonia and spirit are added in the hope of preventing blisters. These torments are a comparatively recent invention of the enemy. I do not remember them before ten years ago. The prevailing epidemic in prints up to that time was measles, of which I have seen very few cases of late years. Blisters seldom appear until the prints are at the final washing water, and you find them useless just in the end of your work, and you are congratulating yourself that you have secured a splendid batch of prints. Further precautions have still to be taken against this pest. After fixing in hypo for a quarter of an hour, in which they should be moved continually, the prints should be removed to a dish of water, into which a handful of salt has been thrown, in the hope to imitate the density of the hypo solution, and finally thoroughly washed. Even this must be done with method. The salt water should not be thrown off at once, and replaced with water of a different density and temperature, but plain water should be gradually added until the salt is gone. The prints must then be washed for at least six hours in many changes of water. The final operation is to put the washed prints between sheets of white blotting paper. If they were now taken out and left to dry, they would curl up, and the albumen surface would probably crack. To prevent this, they should be removed while damp to fresh dry blotting paper for an hour, and finish in still another lot of blotting. This will prevent them curling, and make them dry as flat as you can expect paper to do that has one side glazed with a contracting varnish.

(To be continued.)

BIRKENHEAD PHOTOGRAPHIC ASSOCIATION.—In the annual out-door competition which is to take place at Bidston, Cheshire, to-morrow (Saturday), a silver medal will be given for the best set of six pictures, irrespective of size.

TO IMPROVE FLAT PLATINOTYPES.—Hans Leuhard, of Vienna, recommends the following as a remedy for flat or greyish platinotype prints: 125 grammes of pure gelatine are melted in 1,000 c.c. of water, and the whole gradually brought up to boiling point. After removing from the fire, add 125 grammes of pulverised alum, and dissolve by stirring. Take of this solution one part and water two parts, pour into a flat dish, which should be kept warm by being set in another dish of warm water; immerse the platinotypes to be treated in this bath, and allow to remain for some minutes, then transfer to a dish of cold water and dry between blotters. It will be found that this treatment will restore the vigorous appearance

The Stereoscope.—III.

BY VALENTINE BLANCHARD.

THE high-water mark of popularity for the stereoscope may be fixed at about 1862, and it is curiously noteworthy that while the great exhibition of 1851 practically gave birth to it, the next great exhibition—that of 1862—saw it at its fullest growth. The enterprise of the late Mr. Nottage, of the Stereoscopic Company, secured the exclusive right to photograph the noteworthy objects in that wonderful collection, and he gave into the hands of Mr. England the entire control of the stereoscopic department, and it is not too much to say here that no one could have been found more able for the work. There have been many exhibitions since, but never such a beautiful series of stereoscopic slides, to perpetuate the remembrance of them.

The demand for England's slides of the Exhibition was simply incredible. How many reams of albumenised paper were employed, and how many pounds of silver and gold were consumed, it is difficult to state now; but some idea may be formed of the enormous production of stereoscopic slides when it is remembered that Mr. England, in a paper read before the Photographic Society, May 5th, 1863, on "The Recovery of Silver and Gold from Residues," stated that he recovered 1,000 ounces of silver during the winter. This would represent the waste products of less than a year, for the Exhibition did not open till May.

Shortly after this memorable period a decline in popularity commenced for the stereoscope, and though for several years there was a steady demand for the well-known work of Wilson, Bedford, England, York, and others, a new craze had arisen, and the *carte-de-visite* and album portrait was destined to eclipse the old favourite. It had a reign of about twenty years, however—a pretty long one for any favourite.

In America there was a revival in the popularity of the instrument, and this was due entirely to the improvement made in it by Oliver Wendell Holmes, who was at one time an enthusiastic photographer. As we shall have occasion to describe this instrument fully later on, we will merely say here that it was not boxed in, and was very efficient and extremely inexpensive in comparison with the instruments that preceded it.

It became a question with many American enthusiasts to make collections of the slides of all the well-known photographers all over the world, and to have them catalogued and stored, so as to be ready for reference at a moment's notice. They formed, in fact, stereoscopic libraries, and each tried to outdo his neighbour in the completeness of his collection. Long after the demand had ceased in England, the writer, among others, had repeated orders from the well-known house of Anthony, in New York, in order to make complete these collections.

The demand lasted longer abroad than with us, and England's series of Swiss views were in demand on the Continent several years after the period when interest in the stereoscope had entirely ceased in this country. This history would be incomplete without reference to the remarkable productions of Breeze. At one of the exhibitions a circular stand with eight or ten stereoscopes attached to it speedily attracted the attention of every one interested in the photographic art, for these instruments contained a series of pictures quite different to anything that had ever been exhibited before. They were transparencies, and were illuminated from behind, and in this respect were not different to thousands that had preceded them, but the mode of treatment was altogether so different that speculation and argument arose as to the method of production. As these instruments were carefully sealed, and were

besides firmly attached to the stand, it was absolutely impossible to peep behind the scenes.

The subjects were most varied, but in all there was an entire absence of the usual defect in photography, viz., a want of harmony between foreground and distance. In one there was a view taken in the neighbourhood of the Crystal Palace, for there was the sparkle of sunlight on the distant glass-covered roof; indeed, the whole landscape was bathed in sunshine, and there were no black shadows anywhere. High up in mid-heaven a balloon was careering across the field of view, and there was the glitter from the blazing sun on its silken sides. Every detail of the fleecy cumulus clouds was also visible, and yet everything was in perfect harmony. In another subject, "A Lonely Seashore," the crests of the breaking waves were apparently molten silver, sparkling in the rays of the full moon overhead. The Press of the period went into raptures over this picture, and told the astonished world that at length photography had accomplished the impossible, and that in future there would be no difficulty in photographing moon-lit scenes, for what had been done by Breeze would, after a time, be done by others. This picture puzzled photographers, for there was no doubt about the moon; it was not a painted one, for all the markings to be seen in the moon at the full were there, delicately but perfectly rendered.

In another subject there was a cruel piece of rocky coast lashed by angry waves, but over all there were murky, sullen clouds, evidently illuminated by a red-faced sun, retiring in a groggy condition for the night.

In none of the varied subjects exhibited were there any that resembled the ordinary photographs produced at that time. There was an artistic completeness about them altogether unusual, and the question was constantly asked how they were produced, for ordinary methods and appliances failed to furnish such results. For a long time Breeze kept his counsel, and it was only after several years that his method of working was made public.

Breeze was a most painstaking man, and spent an amount of time over each of his subjects that at the present moment seems incredible. In every case different negatives were taken for foreground and distance, and in some there were as many as four negatives employed. In the moonlight one, for instance, a photograph of the moon was taken, and as it would be very small when produced in an ordinary camera, the negatives were enlarged sufficiently to make the moon large enough for pictorial purposes. By the aid of a repeating back, the two enlarged transparencies of it were made to fall $2\frac{3}{4}$ inches apart on the same plate. This transparency was placed behind the one showing the breaking waves, and as the moon was made to occupy as nearly as possible the position of the sun when the picture was taken, the effect of light and shade was perfectly natural. To heighten the effect of moonlight, the part occupied by the sky was carefully masked so as to enable the moon transparency to produce its full effect.

In the Crystal Palace picture the balloon and clouds were on separate glass, and were placed behind the landscape transparency, and as, of course, the negatives were taken at the same time and with the same effect of *chiaroscuro*, the combination picture appeared beautifully atmospheric and natural.

In like manner artistic dodges gave to the wild and stormy seascapes their mysterious and weird effects, for in some cases the cloud transparencies were toned to a kind of tawny dun colour, and in others a transparent stain was applied to one of the glasses so as to obtain the effect required. All the methods adopted by Breeze to gain his effects were never published, but it will be admitted by all those who remember his productions, that they fully

deserved all the praise that was bestowed upon them at the time. The mode of production was so slow that though a high price was charged for these remarkable slides, they never thoroughly repaid Breeze for all the time and trouble bestowed upon them, and so after a comparatively short time their publication stopped and they became things of the past.

(To be continued.)

Printing in Gelatino-Chloride.

JUDGING from recent reports, albumen printing is still—at least, amongst the profession—the most popular, perhaps we may say the most common, of printing processes, and the invention and introduction of new modes of transferring the photographic image to a paper support, though making much progress lately, has not yet considerably reduced the output and sale of the above commodity. It may no doubt be put down principally to acquired habit amongst the profession, and to the question of price which rules the market. Wherever the latter is not of the first consideration, printing processes pretending to higher claims of art have made great progress, in fact become the favourites. These are notably the emulsion processes, amongst which the Obernetter process of gelatino-citro-chloride holds, probably, the first place.

We include in this designation all the printing processes now practised under different names, but which are simply copies, more or less modified, of the original process of the renowned experimentalist. What is singular is that this excellent process should have lain dormant for over twenty years, practised only by a few special men of professional reputation, and that the advent of gelatine, and the consequent recasting of the principles of the process should have brought it to be the favourite printing process of the amateur of the present day.

The process may be properly described as the "chloro-citro-gelatine emulsion" process, and the paper prepared as a commercial article is still made and sold under that name, though the numerous copies of the article have adopted fancy names, the most known amongst them being the so-called aristotype.

Apart from the chemical constitution, we have in the chloride emulsion a process which holds the image as it were in a transparent medium, as in a negative, hence the greater brilliancy, fineness, depth, and roundness of image as compared with printing surfaces which are more sunk into the texture of the paper support. In fact, no preparation for receiving the positive image is able in so high a degree to render all the fine detail and gradation of tone and definition of the negative as the gelatino-chloride emulsion. This arises partly from the above mechanical constitution, partly from the fact that the slow chloride emulsion has of itself an exceedingly fine grain.

It is this quality, coupled with the general excellence of the paper, which have won for it the place it now holds; and the great variety of tone responding almost to every taste or fancy, and suited to the greatest variety of subjects possible, will, no doubt, assist to keep it in favour. With respect to sensitiveness, gelatino-chloride stands at the head of the printing-out processes, platinotype being at present left out of consideration.

Comparison is best made with a clear plate of glass in the printing frame, behind which two slips of paper are simultaneously exposed.

The toning quality, after a certain time of exposure, may then be noted, and the tint obtained before and after toning compared. The two (taking albumen as the mate-

rial of comparison) are like a poor plate and a plate rich in silver salts. There is more work to be done in the rich emulsion, and more is done. The depth also to which gelatino-chloride will print even after albumen ceases to be any more affected is remarkable, and a purple-black is reached before any bronzing sets in.

Numerous forms of toning bath are applied to the gelatino-chloride paper, the chief ingredient besides the gold being the sulpho-cyanide of ammonium. This salt enters into the composition of the image, contributes to its richness, depth, and tone, and has to be replaced in the toning bath when it is exhausted.

For a 15 grain bath the formula runs:

Water (distilled preferable)	.. 35 ozs. or 1 litre.
Sulpho-cyanide of ammonium	.. 5 drms., 20 grammes
Hypo-sulphite (optional)	5 to 15 grs., 1 gramme.

Into this pour a solution of 1 tube (15 grains) of gold chloride dissolved in 3 ounces of water, stir up and shake both during the precipitation of the gold, until the latter is dissolved, then add 10 to 15 ounces of water. Bath to be perfectly clear and colourless. This bath gives cold purple tones.

Warmer tones are obtained with acetate of soda, as follows:

(1.)	
Water	 18 ozs.
Re-crystallised acetate of soda	.. 4 drms.

When dissolved, add

Gold solution (1 per cent. strength)	.. 1½ ozs.
--------------------------------------	------------

(2.)	
Water	 18 ozs.
Sulpho-cyanide of ammonium	.. 2½ drms.
Gold solution as above	.. 1½ ozs.

The gold solution is here equally divided between the two halves of the bath, which should be mixed shortly before use. For reddish-brown tones 10 to 15 grains of hypo-sulphite of soda may be added.

The acetate bath gives fine brown tones, and would, no doubt, be more generally used but for its uncertainty, the acidity of the bath being at times a troublesome factor. Next to acetate of soda, tungstate of soda, phosphate of soda (giving nearly black tones), chloride of lime, etc., have been pressed into the surface, each giving a slightly different tone to the print, though in the writer's opinion it would be difficult, if not impossible, for anyone to say in which toning bath a print has been toned, on the strength of its brown, black, or purple tone, the quality of which, next to the gold itself, more depends on the sulpho-cyanide of ammonium than any other toning agent.

One of the many varieties is a toning bath containing the necessary quantity of hypo-sulphite of soda for fixing the prints while toning, which has been extensively used, but seems to decline in public favour.

The simplest toning bath is that suggested by Mr. W. K. Burton, C.E., of Tokio, Japan. It runs:

Hypo-sulphite of soda	 3 to 4 ozs.
In water (distilled preferable)	.. 20 "
Gold chloride	 6 grs.

to which Mr. Chester Jervis adds 3 grs. nitrate of lead, in order to preserve perfect whites. This it effectually does. Toning is very slow with this bath. The tones range from a sepia brown to an engraving black, but they lack the richness obtained by the use of the sulpho-cyanide of ammonia, and we have no positive assurance of their permanency. No after-fixing is necessary, but thorough washing and aluming must be very carefully attended to.

Last of all, a concentrated toning solution has been

compounded for the emulsion paper. This is supplied in 50 c.c.m. bottles, which quantity is diluted with distilled water to 20 times its bulk, and used as a toning bath. This is a solution which has for a long time been desired by a great many, and will be welcome to hundreds of amateurs.

There are two solutions, A and B, either of which may be used, or both jointly, to make up a toning bath.

The one gives fine rich brown tones, the other black, and is especially suited to the matt-surface paper brought out lately.

The tone obtained with the combined bath is the finest black, with a tinge of purple in the half tones and perfect whites.

Toning goes on rapidly, fixing and aluming in the usual way, but three washes in water (distilled preferable) are recommended *before* the prints are placed in the toning bath. There is, we should say, likely to be a brisk demand for this particular paper and bath.

Toning chloride prints presents no difficulty whatsoever, except that usually seated in the operator's head, who has in most cases been taught to tone on the lines of albumen toning, and cannot be taught to adapt himself to the treatment required by chloride emulsion. This is mostly the case with the professional printer, less so with the amateur.

The ways contracted with albumen printing and toning must, however, be entirely put aside.

Careful printing to the proper depth being presupposed, there will be much less waste in printing and toning with chloride emulsion than in most other processes. Every print that goes into the toning bath must be watched.

For the preliminary baths the prints must be turned over two or three times, and freed from *air bubbles*, which if not removed would produce spots in the finished prints.

More than three or four prints should not go into the toning bath together; the same applies in regard to fixing. It may also be mentioned that it is advisable to lay the prints face upwards in fixing, while in the alum bath they should be laid face downwards.

The tone to which the prints may be brought will be a matter of individual taste and fancy, the range of tone obtainable being quite on a par with every possible notion of brown, purple, or black; the latter, even when carried to the utmost, always leaving the finished print with a certain warmth of tone which makes the charm of a photographic print, but which of late some would-be artists seem to depreciate by leaning towards the notion that to be "artistic" a photograph has to be in absolute black and white, something in the way of an imitation of an engraving, which, of course, is "art," and this characteristic is to give the photograph that secret touch of "art" which most likely it would not otherwise possess.

When the desired tones are obtained, the prints are washed for a minute or two and passed into the fixing bath, from whence they go into the washing, with after aluming and washing again until they leave the water perfectly clear. Special care is recommended for these operations, and it will be well to remind workers that they have to do with gelatine and not with albumen, and special care in handling prints must be recommended.

The toning baths may be kept good for a long time, but should be filtered after use and strengthened up with sulpho-cyanide of ammonia and gold. Amateurs will find it best to make up the necessary quantity of bath which they can approximately exhaust with the toning they have to do, and to make a fresh bath for the next batch of prints.

After-Treatment.—This part of the operations may be applied for effect, and appeals to the taste of the worker as much almost as the taking of the plate or the choice of subject.

After washing, the prints may be simply dried and pasted on a suitable mount, or they may be squeegeed on a polished or a matt plate of glass, vulcanite or specially prepared metal plate. The finest surface is obtained by laying the prints down on sheets of celluloid, which can be had with both polished and matt surfaces. Special mountants can be had, or the prints may be backed with a piece of stout cartridge paper while down on the plate, drying in this case taking at least double the time as without the backing.

A good mountant has been suggested by Mr. Warnerke, consisting of dextrine with some spirits of wine mixed with glycerine.

Objection is often taken to the glossy surface as not being artistic. While not wishing to encourage that particular finish, there can be little objection to it if it is properly done, and the surface is perfectly even, and a good artistic photograph will look none the worse for being under a perfectly even and flat surface. But if it is intended to give a particular lustre to an otherwise bad and inartistic print, it will certainly fail to do so effectually in the eyes of any one gifted with good taste; whether the surface be a matt or a glossy one will not make the print a work of art or the contrary. The artistic merit of a photograph does not lie in the matt or shiny surface, but in the photograph itself; in the delineation and balance of the subject matter, in the lighting, perspective, grouping, and subsequent proper and suitable development of the plate to bring out the desired printing quality of the negative. That may be the case with a glossy as well as with a matt surface, and when beneath a glossy and perfectly even surface an artist's picture is to be seen, it may enhance the depth of its shadows and bring increased sparkle into the charming detail of its high lights. The remark has been made that Obernetter paper is not artistic. No, it is not, and never will be, but it will lend itself to artistic picture-making if the printer or operator has artistic feeling and taste; that is where the art must be—not in his paper, plates, or lenses. There may be even much art and science in designing them and bringing them to great technical perfection, but they do not help much to produce an artistic picture unless put into hands backed by a mind endowed with artistic feeling and taste. Art is in finding the best subject from amongst a crowd of indifferent ones, in taking it under suitable conditions of light and perspective, and at the right moment, in the proper exposure, followed by suitable development, choosing the right printing material, and carrying out not only the technical manipulations properly, but with the object in view of reproducing as much as possible all the charm that nature had bestowed on the original; in our case (at least for the present) that of colours excepted.

Another mode of finishing is to give a matt surface. For this purpose either a matt-drying paper may be used or the finished print may be squeegeed on to finely ground glass, or ground celluloid sheets, which are obtainable for the purpose. The precaution of taking the plates is necessary to insure them coming off safely. In case celluloid is used it may be of less importance, but one thing must be remembered, that spirits of wine and celluloid have a great affinity, and in case celluloid sheets are used the prints should *not* be passed through methylated alcohol.

All these finishing operations should be performed with great care, and the different modes of treatment chosen not indiscriminately but according to the nature of the subject, tone, or character of the picture.

Another variety of toning is that with platinum. The salt required is the potassium chloro-platinate, of which 1 gramme is dissolved in 20 c.c.m. water, or, say, 25 grains in 1 oz. of water.

Neutral oxalate of potass.	90 grammes.
Phosphate of potass.	45 „
Distilled water	1 litre.

The toning bath is made up of two parts of the potassium solution, two parts of distilled water, and one part of the platinum solution.

The bath will keep about one hour, and after toning for 30 to 40 minutes strengthen the bath with platinum, and continue toning.

Printing slightly deeper than the finished copies; washing previous to toning through two or three baths of cold water, distilled preferred.

The prints are laid *face upwards* into the toning bath; toning takes about two minutes in summer; in winter three to four minutes. The prints are toned until they look violet by transmitted light. As soon as the desired tone is obtained, the prints are put into a washing trough, best a syphon, where the water is continually renewed. Careful and thorough washing is necessary, as the pureness of the whites greatly depends on it. Fixing some time after washing in hypo, and another wash finish the operation.

Laying down on ground-glass for matt or celluloid surface will give a fine effect to the finished print; the final tone is a beautiful sepia brown. There may be other varieties of this toning bath; time and experience will no doubt find out the best.

Thus printing in gelatino-chloride offers the greatest possible variety of tone and finish, and appeals more than any other mode of printing to the artistic taste of the printer and toner, and the results will be beautiful and artistic or not, according to the treatment and care bestowed upon the material put into his hand.

Permanency.—Doubts have at times existed as to the permanent character of the image in chloride. Experiments have, however, been made that gave the question a perfectly satisfactory solution. As to permanency against the action of light, it is absolute, and experiments have proved that the image is a perfectly safe one, and the whites will keep perfectly pure, provided that washing has been attended to properly. As to the action of injurious gases, gelatino-chloride is safer from them than any other preparation in which silver in any form is employed; and the fact that the final image consists practically of gold chloride, more than is the case in any other process, is another point in its favour as to resistance against deleterious gases.*

We have, in fact, in the gelatino-citro-chloride, a printing process that has a great future before it, and fulfils almost every demand that can be reasonably made upon a sensitive printing material.

MR. J. C. ROBSON, of 37, Leventhorpe Road, Middlesbrough, has fitted up a dark-room, and will be pleased to place it at the disposal of photographers.

MESSES. F. E. BECKER & Co., of Hatton Wall, Hatton Garden, have just issued a new catalogue of a most comprehensive character, which shows that they are in a position to supply apparatus of every kind and good quality for ordinary photographic purposes, enlarging, photo-micrography, etc.

THE SOUTH ADELAIDE AM: PHOT: SOC: held its monthly meeting at the Chamber of Manufactures on the 10th of April, Mr. S. J. Dailey being in the chair. There was a fair attendance of members, and after the general business of the evening had been transacted some very fine stereoscopic views, taken by Mr. F. Krichauff while on a tour through Tasmania, were handed round for inspection. During the Easter holidays Messrs. G. Stace and R. B. Adamson, members of the above Society, took a trip to Clarendon, camping out for two days, during which time they obtained some very fine views along the Onkaparinga River.

* Resulting from experiments made by Mr. Lyonel Clark and others.

The Photographic Survey of Warwickshire.

A MEETING of those interested in the Warwickshire Survey was held at St. Edmund's College, Birmingham, on Thursday, May 22nd, the Mayor of Sutton Coldfield, J. B. Stone, J.P., F.G.S., F.L.S., etc., being in the chair. There was a numerous attendance of the members of the Birmingham Photographic Society, together with representatives from the Vesey Club, the Municipal School of Art, the Coventry Photographic Society (Mr. F. W. Dew), the Philosophical Society, etc. Letters of apology were read from Mr. Sam Timmins (the historian of Warwickshire), Richard Tangye, Surgeon-General Ranking (President, Leamington Photographic Society), H. W. Jones, F.C.S. (Vice-President, Coventry Photographic Society), A. E. Donkin (Rugby School), H. R. Lloyd (Birmingham Archaeological Society), Professor Poynting (Mason Lodge), and many others, all giving their approval to the Survey, and promising to help in the work.

Mr. Stone said that the object of the meeting was to organise a County Survey Council which should take charge of, organise, and carry out a survey of every object of public interest in the county of Warwickshire. The survey would include photographs of buildings, ancient and modern, of ancient manuscripts, of paintings, of objects of geological and botanical interest—it would, in fact, form a record which would enable future generations to have some idea of the state of the county as it existed in the latter part of the nineteenth century. He referred to a letter which had been received from the Secretary of the Birkenhead Photographic Association claiming originality for the idea of making a photographic survey. There could be no originality in the idea, for it had been carried out—after a fashion—many times. He had himself made what he supposed the Birkenhead Society would call a photographic survey, by photographing all the old buildings in the hundred of Hemlingford, quite a quarter of a century ago. But the survey which Mr. Jerome Harrison had proposed, and which they were prepared to carry out, was something of an altogether different nature. He proposed “That a County Photo-Survey Council be created for the purpose of organising a complete photographic survey of Warwickshire; such Council to consist of elected representatives from the various photographic societies in the county, in the proportion of five per cent. of the members of each society, together with two representatives from each of the scientific, literary, and artistic societies in the county; that the Council shall have power to elect co-optative members, and shall appoint public trustees for taking charge of the records obtained.”

The motion was seconded by Mr. W. Jerome Harrison, F.G.S., who said that he heartily welcomed the presence on the survey of the scientific and artistic workers whom he saw present. They could lend great aid in drawing up bits of noteworthy objects—each in their respective line—to be photographed. He trusted that Mr. Bagnall, whose “Flora of Warwickshire” was on the eve of publication, would at once supply them, for example, with a list of famous trees within the county. Mr. Jethro Cossins, the eminent architect, had promised help with the churches. It would be part of their first work to obtain information as to the thousands of valuable negatives which were already in existence.

Mr. W. Buncher (School of Art) hoped the Council would take into early consideration the question of publication of a selection of the results obtained. He thought that a thousand subscribers to such a work could be obtained with ease.

Mr. F. W. Dew (Coventry) promised hearty co-operation in the work, and alluded to the great alterations which had been made within the last few years in the churches of Coventry. He had many valuable negatives of those churches before their restoration.

Messrs. Thomason, J. Udall, F.G.S., J. Landon, F.G.S., C. H. Marston, Cottrell, S. G. Mason, Jethro Cossins, B. Karleese, and others also took part in the discussion.

The motion was carried unanimously and with enthusiasm.

The Chairman proposed, Mr. S. G. Mason seconded, and it was carried unanimously, “That the first co-optative members should be appointed at that meeting; that they should retire at the end of the current year, when the Council shall proceed to elect other members to fill the vacancies, the retiring members to be eligible for re-election.” A number of names of eminent

persons residing in the county were mentioned, and Mr. Stone undertook to communicate with them.

The last resolution, which was put from the chair, seconded by Mr. Jethro Cossins, and carried unanimously, was "That the photographic and other societies of the county be requested to at once elect their representatives, and that the first meeting of the new Council be called for June 12th."

The meeting, which had been an extremely encouraging and even enthusiastic one, then broke up, after passing a hearty vote of thanks to Alderman Stone for his able conduct in the chair.

Science Notes.

THE *Graphic* last week contained eight capital illustrations of "Episodes in the Training of Stokers," which were from photographs by Lieut. D. H. Drake Brockman. The fact is that officers in either of the services are beginning to find the camera an indispensable tool.

In the same number our contributor, Major J. F. Nott, is well represented by two engravings from what must be admirable photographs of the new Gordon statue at Chatham, and of the sculptor (Mr. Onslow Ford) at work in the Zoological Gardens, for his model of the camel on which the hero is seated.

In *Knowledge* for May there is a photographic reproduction of a negative of the moon (showing our satellite five inches in diameter) taken some months ago with the great 36 inch lens of the Lick telescope in California. Mr. Ranyard gives some interesting notes on lunar markings as shown by this and other photographs.

"Jack of All Trades," in the *English Mechanic*, gives the following instructions to painters of lantern slides who wish to keep their slides free from dust: "Your room must be kept very clean, and your clothes should be such as brown holland, well starched and got up, floor well swept and sprinkled with water, and all precautions taken to prevent dust; a portable shade for your work, covered top and three sides with fine glazed calico or tracing-cloth, high enough for you to work under, with fall to let down when left."

Mr. L. Sambon has obtained some excellent white-plate negatives of the volcanic phenomena now occurring on the island of Vulcano (one of the Lipari Isles, near Sicily).

Dr. Johnston-Lavis, writing in last week's *Nature*, says that comparing these photographs with those taken by himself six months earlier, but little change is visible.

Photographers generally were much pleased to see the name of Mr. H. Trueman Wood (Secretary of the Society of Arts) included with those who received knighthood among the Birthday honours. Sir Trueman Wood has done much for photography, and is himself an expert in the art.

Admiral Mouchez, at the meeting of the Paris Academy of Sciences of May 12th, presented a note on some new photographs of the moon obtained by the Brothers Henry at the Paris Observatory. The instrument used was the new equatorial refracting telescope with a $12\frac{1}{2}$ inch objective. These photographs are said to be far superior to those obtained in England and in the United States with far larger instruments, the superiority of the results being attributed not only to the perfection of the lens employed, but also to the method of direct enlargement.

At the Royal Society Conversazione, held on May 14th, Mr. E. Bidwell exhibited two photographs of each of fifty-three eggs of the great auk, a bird which became extinct about sixty years ago. Only sixty-seven of its eggs are known to be in existence, and these are worth £200 apiece.

Professor Marshall Ward exhibited a selection of transparencies showing (1) the habits of trees from various parts of the world; (2) the comparative structure and anatomy of several European timbers; and (3) some of the more prominent features of the diseases of wood, and of the fungi causing them.

Mr. W. B. Croft exhibited two sheets of glass, between which some paper printed on one side only had lain for ten hours; the print appeared in white on each sheet of glass. This resembles the phenomena noticed by Moser in 1840.

Mr. H. C. Sorby, F.R.S., had a remarkable collection of small jelly-fishes and other invertebrate animals prepared as lantern slides. The success of the method depends on the fact that when soft-bodied animals are dried on glass the extreme edge dries first, and adheres firmly, so that on further drying the animal

does not contract irregularly, but becomes thin and flat, and shows like a drawing on the glass. The specimen slides exhibited not only the general form, but much of the anatomy of the creatures.

The lady whom Mr. Stanley is to marry—Miss Dorothy Tennant—is the sister of Mrs. Eveleen Myers, who has earned some distinction as a photographer.

A branch of the Brins Oxygen Company is shortly to be opened at Saltley, the northern suburb of Birmingham, where oxygen gas will be both made and compressed. There is an extensive opening for the use of oxygen in the metropolis of the midlands, as so many of the trades carried on involve brazing, hard soldering, etc., in which the use of an intensely hot flame (such as can be obtained with the oxy-hydrogen blowpipe) is a great advantage.

The steel tubes in which compressed oxygen is stored will probably be largely made in future by the wonderful new Mannesmann process, in which a solid bar of metal is placed between a couple of rapidly revolving conical steel rolls, and is "spun" instantly into a tube of great strength.

The *Journal of the Asiatic Society of Bengal* for 1889 contains valuable tables of metric weights and measures, prepared by Colonel J. Waterhouse for the use of the photographic and lithographic offices of the survey of India.

The *Alpine Journal* for May thus alludes to the influence of the Naturalistic School on the "Mountain Pictures of the Season:" "We have produced a certain number of artists who year after year lived for several months together in the Alps. They were the companions of climbers—were often climbers themselves. They looked at mountains as things to be climbed. Their ideal was accuracy of form and truth of detail in foreground and distance. Now, however, a new ideal begins to reign, and a new art results from it. Artists are paying much more attention to atmospheric effects than ever before. They are painting the atmosphere, with figures, houses, trees, mountains, or what not for background. Details thus shrink into insignificance. Apparent inaccuracy of detail seems to obtain. Much of what we used to like is thus lost, but certain new qualities of size are now attainable, and by some artists are attained. Not impossibly, artists of the new school may devote themselves to mountain landscape. Some known Alpine artists show signs of looking at the old scenes with new eyes. The old art is at any rate passing out of fashion and ceasing from the walls of our exhibitions. Alpine landscape will either no longer be painted or it will be painted on new principles. We await the development of the next few years with interest, and not without hope." This seems to us a very fair critique.

F. G. S.

Our Contemporaries at Home and Abroad.

L'Amateur Photographe (Paris) gives the following method of development: "The exposed plate is plunged in a dish containing a solution of pyrogallie acid; then, when the gelatine is thoroughly penetrated by the solution, it is exposed above a dish containing ammonia. The appearance of the image is more or less rapid, in proportion to its nearness to the ammonia. This method can be used when it is desired to force the development of a part of the plate, and the pyro solution lasts longer, as it is not mixed with an alkali."

The *Photographic Times* (New York) says: "There is a general tendency of all vegetable fibre to stretch; and although paper manufacturers have tried to reduce this tendency to a minimum, they have not succeeded in doing away with it entirely. It will expand somewhat, whether we use it without coating, in the plain form, or when albumenised. Heavily albumenised paper, under certain conditions, is more likely to expand than paper prepared with a diluted solution of albumen. Permanent bromide and chloride of silver gelatine emulsion paper does the same, while collodion aristotype paper perhaps less than any. The reason for this is obvious, and it is probable that the curling up of collodion coated paper in water is owing to the same fact. The collodion coat being opposed to the expanding of the supporting paper forces it inwardly. It is true that when unmounted albumen prints are dried, they nearly return to the original dimension, but as all our practical mountants are in aqueous

solution, and the prints become thoroughly wetted by brushing the paste over them, they expand, and when transferred and dried upon the mount, will remain so. A young amateur recently stated that prints soaked in glycerine, alcohol, and water, for the purpose of keeping them flat and unmounted, show considerably less tendency to stretch than those without this preliminary preparation." Articles: "The Origins and Progresses of Photo-Engraving," "Naturalistic Photography," "Rules and Effects of Lighting," "Platinotype Possibilities," etc.

Holiday Resorts and Photographic Haunts.

NOTES OF A PHOTOGRAPHIC TOUR FROM PERTH TO BRAEMAR,

By Dunkeld, Blairgowrie, and Bridge of Cally, returning to Perth or Dundee by Ballater, Aberdeen, and Arbroath.

By ROBERT MURRAY.

THE route I have indicated makes a delightful round with the camera, and should be allowed not less than ten days. I prefer the early summer for my Scotch excursions, as accommodation is then more readily found at the hotels, most of which adopt a lower scale of charges at that time of the year, and you have, of course, longer light to work with than in the autumn. Again, the weather in the Highlands is generally finer and dryer in May and June than later. When I go on these expeditions I mean business, and confess to a selfish preference for taking the camera as my only companion—my *second wife*, as my better-half is fond of telling me!

Leaving Perth, then, on a Monday morning in June, I take the train to Dunkeld (where I had photographed before), and thence by coach to Blairgowrie. The drive, of some fifteen miles, is a very enjoyable one, through a country rich in wood and water. I arrive in good time to walk or drive to Craighall (General Clerk-Rattray), which is one of the most romantically situated houses in Great Britain. It is built upon the very edge of a precipitous rock, 220 feet above the bed of the river Ercht, into which you may drop a pebble from the drawing-room window. By leaving your card at the house you get permission to descend by a private path to the level of the river, where you find a splendid view of the house itself, perched upon its "craig" and surrounded by finely wooded rocks, with the river in the foreground. (Afternoon sun.)

Returning to Blairgowrie, I engaged a dog-cart to take me on to Braemar the following day.

Tuesday.—This is a drive of about thirty-five miles through a land of "mountain and flood, brown heath and shaggy wood," the road being so hilly that about seven hours is the average time allowed. A halt is made at Bridge of Cally for man and horse to refresh, and here the old and new bridges over the Black Adder, etc., are fine subjects for the camera. Braemar was reached too late to do any photographing that day, so we put up at the "Fife Arms," and take a stroll to reconnoitre.

Wednesday.—At Braemar. We are now in a veritable photographer's paradise, having half-a-dozen first-class views within five minutes' walk of the hotel, and many more within a reasonable distance. From the banks of the small river Cluny, which flows through Braemar, we have a fine view of the bridge with the picturesque hotel behind. From the bridge itself there are two splendid views of the river, with old mills and trees in the foreground and hills beyond, other fine bits opening out as we ascend or descend the Cluny. The old castle of Mar is within half a mile, and must, of course, be taken. This will be enough work for one day.

Thursday.—The second day at Braemar may be profitably spent by a drive to the Linn of Dee, where the river rushes through a narrow chasm, and there is a bridge, and old Scotch firs, and large boulders tumbled about.

Friday.—The third day at Braemar should be devoted to the old bridge of Dee and the scenery down the river, returning by the small river Garrawalt, and the splendid woods of Ballochbui, on the Balmoral estate.

Braemar itself is a most interesting place, located high up

amongst the hills, with the Cairngorum range in the immediate neighbourhood; and the bracing quality of the mountain air is such that one can walk astonishing distances—and drink no end of whisky—without feeling any the worse for it!

Saturday.—The morning of the sixth day from Perth found me on the top of the coach for Ballater. The road keeps close to the river Dee all the way, presenting many fine stretches of river scenery, and affording a good view of Balmoral on the opposite bank. As there is not much at Ballater to photograph, I took the train to Banchory on Dee-side, where I arrived in time to get some good views of the extremely picturesque bridge of Fough, which is close at hand.

Sunday.—Staying over the Sunday at Banchory, from which some delightful walks may be taken—

Monday.—I took the train on Monday morning to Crathes station, near which is the fine old castle of Crathes (Sir Robert Burnett). Here I took several views, and then went on by an afternoon train to Drum station, only a few miles distant, where there is another interesting old castle, called Drum Castle (Mr. Irvine). Both of these castles are inhabited, but their respective owners kindly give permission to gentlemen (or ladies) wishing to photograph the exterior. I then continued my journey to Aberdeen, taking up my quarters at the British Hotel.

Tuesday.—This day was devoted to the cathedral of St. Machar, and the curious old College buildings of Old Aberdeen, which is about a mile from the modern granite city. Here also is the old Brig-o-Balgony over the river Don, which makes a good picture.

Wednesday.—Having heard much of the coast scenery of North-East Aberdeenshire, I took the train this morning to Peterhead, and drove thence, about six miles, to the Bulters of Buchan. Here is seen a stretch of coast unequalled in Great Britain for the rugged grandeur of the granite rocks, amongst which the sea is perpetually seething and "spouting" with a deafening roar. "Bulters" means locally the "Boilers" of Buchan.

Thursday.—From Peterhead back to Aberdeen, and thence to Glamis and Arbroath on the way south. At Glamis is the famous old castle of Glamis (the Earl of Strathmore), and at Arbroath or Aberbrothick, the ruined abbey; both well worth photographing.

* * * *

KELSO AND DISTRICT.

By J. ROSS CORMACK.

At this time, when amateurs are packing apparatus and consulting guide-books for fresh fields to conquer (photographically), a few words about Kelso, which the writer considers one of the most delightful head-quarters in Scotland, may not be amiss.

Kelso is fifty-two miles distant from Edinburgh, but the tourist from the South may reach it either from Berwick (twenty-four miles), by a direct branch line, or from Carlisle to St. Boswells, where he changes for Kelso.

The town is ten minutes' walk from the station, but the principal hotels have 'busses which meet the trains. In Kelso itself one of the best photographic views is the bridge, with the Abbey on the right, and the town in the background. This makes a splendid photograph, and should be taken before noon. The tourist had best keep his eye on the cows which graze by the river, as, not being used to photographers, they have a tendency to charge the camera, which, to put it mildly, is not altogether convenient. If, however, they take it into their bovine heads to group themselves, they make a charming addition to the picture. Then there is the ruin of the once powerful Abbey, which before the Reformation owned nearly all the country round, and had possessions as far north as Aberdeen. Its history may be obtained from any of the guide-books. The style of the architecture is a mixture of Norman and Gothic; and, like all the abbeys in the district, was founded by King David. One or two good views of it can be got from the parish churchyard early in the morning: the other sides require a wide-angle rectilinear lens to take them properly. Indeed, a lens of this type is almost necessary for the district.

Floors Castle, the seat of the Duke of Roxburghe, is close at hand, and directly opposite it, is Roxburgh Castle. Only a few stones remain of what was in the olden days a powerful border stronghold and royal residence. James II. was killed by the bursting of one of his cannon, while besieging it. About two

miles from Kelso, on the river Eden, are the Falls of Stithill, which make a pretty picture. Ednam village is another walk of about two miles, and in a large white house near the bridge the Rev. F. H. Lyte, author of "Abide with me, fast falls the even-tide," was born.

On the Teviot and other rivers many pretty views of river scenery may be obtained.

But the tourist staying at Kelso can scour all the country round, and return each day with rich spoils in his slides. Jedburgh, the ancient border town, is only ten miles by rail, and the stately Abbey affords many negatives, notably one or two from the bed of the river. Some of the bridges on this river (the Jed) make lovely photographs.

Ten miles, too, from Kelso is St. Boswells, and a pleasant walk of about two miles takes one to peaceful Dryburgh Abbey, where Sir Walter Scott is buried. Then again, a trip of sixteen miles in the same direction lands one at Melrose, whose Abbey is, in my opinion, the queen of them all. Abbotsford, where Scott lived, is three or four miles from Melrose. But it would take too long to tell of all the excursions in the neighbourhood, and I must only mention Telholm, once the camp of the Scottish Gypsies. Smailholm Tower, Norham Castle, and Twizel Castle.

There is free trout angling on the Tweed, Teviot, Eden, and many other streams, and the roads are in a good condition for cycling.

Apparatus.

HOME-MADE DARK-TENT FOR CHANGING OR DEVELOPING.

EIGHT laths 2 ft. 3 ins. by 1 in. by $\frac{1}{4}$ in. In four of these (A), $\frac{1}{8}$ in. from each end, cut $\frac{1}{4}$ in. square holes. With the other four make two X's (B), by rivetting them (two copper rivets, 1d.) a little above the centre, so that the lower ends open a little wider than the upper. Cut the ends of these X's thus:  to fit tight into the square holes in pieces A. Join two pieces A together by string 14 ins. long (C). Using these two as your top, fit them on to the tops of your end pieces B, and fit the other two A on to the bottom of B. Allow the ends of B

to project $\frac{1}{4}$ in. through A; they will prevent your cover slipping about.

Make your cover of one thickness of black twill, lined with one thickness of yellow sateen. Cut out both pieces as in illustration. Sew along the edges and across the dotted lines, to keep the two pieces well together. At F let in a square of ruby medium, to give light when working either by daylight or in a gas-lighted room. Sew D and E together. Your cover is now complete. Throw it over your frame, E-E being the back end; tuck in the spare under the feet of the frame, across the back,

and round the sides. Having placed your frame on a table or chest of drawers, a few inches from the edge, put head and shoulders inside, and draw the open end of the cover over you;

pick up the right hand loose corner, and, drawing it under your arm, cross it in front towards the left, and tuck it over and under the front lath A; ditto with the left corner. With a very little care you can exclude all light. In this I have changed and developed dozens of plates without mischance, using (when necessary) a shilling triangular lamp with a pyramid night-light, three dishes (omitting the alum), and a dark box. Don't forget a good piece of waterproof for the base. In drawing yourself out of the cover, place a hand on the top front frame to prevent pulling it over. The whole thing will roll up into 2 ft. 3 ins. by 3 ins.

Notes from the Liverpool Centre.

(By our District Editor.)

THE exceptionally bright and genial weather which has favoured the holidays has had the effect of keeping the attendance at societies' meetings, demonstrations, etc., rather thin. So far as I can gather, a large number of members, representing the bulk of societies here, are "out of town, operating." On Saturday there was a considerable exodus from Liverpool; the Lake District, North and South Wales, Ireland, Scotland, the Isle of Man, Norway, and the Continent being the places of destination. For the most part the "jaunters" went away in pairs and small parties.

The Liverpool Association hold their fifth ordinary meeting of the present session this week! Half a dozen gentlemen are, I hear, to be elected to membership. Mr. Wm. Tomkinson will report on the Burton excursion; Messrs. J. W. Turner and Co.'s patent Simplissimus hand-camera will be exhibited and explained, and Mr. J. MacDonald Bell will show Fallowfield's Facile camera and other novelties. The event of the night, however, will be the exhibition of the New Boston (U.S.A.) slides, particulars of which I gave last week. At the fortnightly practical demonstration on Wednesday, Mr. Paul Lange gave "Printing and Toning in Platinotype." The Liverpool exhibits from the Crystal Palace and Newcastle Exhibitions are now hung in the Society's rooms, where they are generally accepted as representative of Liverpool amateur work.

There is likely to be a big turn-out at the Birkenhead Society's annual out-door competition at Bidston next Saturday. Members of other societies are invited.

Mr. C. W. Reader, Honorary Secretary of the Boston Return Set, would be glad to get this matter completed. Gentlemen who have negatives and prints of Liverpool and district will do much towards helping the work if they will be good enough to signify their intention of contributing.

Societies' Meetings.

NOTE.—In this column the Editor can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editor will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

CAMERA CLUB.—On Thursday, May 22nd, Mr. E. R. Shipton read a paper entitled "Cycle Photography; some Recent Developments, including an Ideal Cycle." Sir George R. Prescott occupied the chair. Previous to the address, the Hon. Secretary handed round a Watkin's exposure meter, a compact instrument devised to indicate exposure to be given under varying circumstances, also one of Messrs. Fallowfield's "Perfect Sheaths" (Miall's patent) for holding plates. Sir George Prescott exhibited one of Lawrence's hand-cameras, a new introduction, in which by a simple movement the plates are brought into position and removed. Mr. Shipton commenced his address by summarising his previous lecture on the subject of the "Wheel and Camera," pointing out the use of the cycle in this connection for bringing the photographer into contact more easily with beautiful scenery. He then proceeded to describe his own cycle specially devised for photographers' work. This included some ingenious and effective carriers, upon which he had carried a hundred weight of luggage safely; also a spring frame, and particularly the new

pneumatic tire, by which, as Mr. Shipton expressed it, the rider carried his own road with him and laid it as he proceeded. These tires, he considered, in addition to the luxury of smooth going, added speed to the extent of two miles per hour.

FAVERSHAM INSTITUTE PHOT. SOC.—The inaugural meeting of this society was held at the Faversham Institute on the 20th inst., Dr. C. J. Evers in the chair. Mr. Charles Hussey read a paper entitled "Photography, Technical and Artistic." Mr. Hussey is an amateur photographer of considerable experience, and evinced a thorough knowledge of his subject. Dividing his essay under the three heads of (1) topographical photography, (2) artistic photography, and (3) scientific photography, Mr. Hussey dwelt in detail on the importance of technique—technical photography—and explained how a large camera, though very nice for an artist's purposes, is by no means a necessity to the ordinary topographical photographer, who wishes to take views of scenery during a ramble or a holiday, as the small cameras are much more portable and compact, and from good quarter-plate negatives excellent enlargements can be made. He (the speaker) preferred for ordinary use a $3\frac{1}{4}$ by $3\frac{1}{4}$, and this camera he produced, and it certainly was a wonderfully compact little apparatus—a veritable pocket camera. Mr. Hussey concluded his address with some useful general hints for beginners. A hearty vote of thanks was accorded to Mr. Hussey for his kindness in coming and giving his able address. A collection of excellent enlargements, kindly lent for exhibition by the Editor of the AMATEUR PHOTOGRAPHER, were on view, and proved highly attractive and instructive.

HACKNEY PHOT. SOC.—The ordinary meeting was held on the 22nd inst., Mr. Roland Smith presiding. Mr. Wall sent a very interesting paper on "The Chemistry of Photography." He purposed making it quite elementary, as many only took up photography for the sake of pictures, and not from any theoretical motives. He gave an interesting account of plate manufacturing and chemicals used in it, also chemicals used in all the other processes. At the close of the paper a discussion ensued. Mr. Bruce Capel was elected a member. The excursions will commence on June 4th to Loughton, and on the 7th to Wanstead Park.

HOLBORN CAMERA CLUB.—The usual monthly lantern night was held on Friday, the 23rd inst., when about 200 slides, by Messrs. Dear, Plumbridge, Baker, Chang, and Bayston, comprising views in York, Sheffield, Burnham, Epping, Hampstead, Fort Grain, Ballyclough, etc., were shown to an appreciative audience of members and friends. Next Friday members are requested to bring up results of work done during the Whitsuntide holidays for comparison.

SHEFFIELD AND DISTRICT LANTERN SOCIETY.—A well-attended meeting of the above society was held on the 21st inst., the President, Dr. Manton, being in the chair. Specimens of hand-cameras were exhibited. The President exhibited specimens of negatives developed by a process which he has recently patented; other members also exhibited specimens of work. An animated discussion followed. An excursion up the Rivelin Valley will take place on Saturday, the 31st inst.

Mr. E. G. PLATT, who has been very justly called the "amateurs' friend," has removed from Alvington Crescent, Kingsland, to Birbeck Works, Birbeck Road, Ridley Road, Kingsland, N.E. Mr. Platt manufactures all brass fittings for cameras, lenses, finders, view meters, etc., as well as bellows for cameras, etc. He has also a dark-room for the use of photographers. His new premises are well worth a visit.

OURSELVES.—A correspondent from Assam writes, "I look forward anxiously each week for the AMATEUR PHOTOGRAPHER, and wish to tender you my best thanks for having supplied such an excellent paper, especially to such as myself, who are unable to get any instruction in photography otherwise than from books."

THE PHENIX PLATES, the new brand of cheap plates which have just been put on the market by the Paget Plate Company, are excellent. They are carefully coated, good density is readily obtained, and they are sufficiently rapid for ordinary snap shots in the hand-camera. We can recommend them for the production of good all-round work,

Register of Dark-Rooms, 1890.

THE following "Dark-Rooms" have been placed at our disposal.

We class them in four divisions, *i.e.*, a amateur, d dealer or professional, h hotel, and s photographic society.

In our letter of introduction full particulars are given as to owner, address, charges (if any); plates, chemicals, etc., kept by dealers; terms for temporary membership of societies; hotels; distance from station, etc., etc.

Every application for letter of introduction must be accompanied by SIX PENNY STAMPS. The owner of "Dark-Room" will be advised by same post as the applicant. The envelopes should bear the endorsement DARK-ROOMS.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

QUERIES.

3846. **Set, Information Wanted.**—What is the best set to purchase (plain, cheap, good) to take cabinets, and change to take cartes-de-visite? And all information, details—if in a book, the cheapest—for plain work only at present, as I have no opportunity of practical tuition, and will require to learn by myself. Will Mr. H. Leach oblige?—**NED.**

3847. **Plates.**—I would like to know how the Ilford white label half-plates compare with Thomas' extra rapid as to speed?—**GRONO.**

3848. **Exposure.**—How many seconds would be the correct exposure for a Thomas' half-plate with Lancaster's half-plate Instantograph lens at $f/10$, for view of a bridge with diffused sunshine in Lancashire?—**GRONO.**

3849. **Moving Objects.**—Can moving objects be photographed correctly on Thomas' extra rapid plates with the Instantograph lens?—**GRONO.**

3850. **Reducing.**—I should like a reducing solution almost certain in its effect, preferably one which would reduce an over-intensified negative with bichloride of mercury. A formula for the above will oblige.—**SELF-TAUGHT.**

3851. **Intensifier.**—Which is the best way of intensifying, with half-saturated solution of bichloride of mercury and half water or bichloride of mercury quarter of an ounce, and the same quantity of chloride of ammonium, and 10 oz. of water for re-developing?—**SELF-TAUGHT.**

3852. **Hydroquinone.**—I want to make this developer on the 10 per cent. principle, but finding hydroquinone not very soluble in water, should like a little advice, also the maximum quantity of bromide for over-exposure, without spoiling the plate, and the minimum to take an effect, and the same for sodic hydrate, and quantity of water to weaken developer for slow development, Ilford formula; should be very glad if answered number of minims to an ounce?—**SELF-TAUGHT.**

3853. **Stops versus Iris Diaphragms.**—Which is the better for a raw amateur to get when ordering his first set of apparatus—a lens fitted with ordinary stops, or with an Iris diaphragm? What are the advantages and disadvantages of each?—**RAW AMATEUR.**

3854. **Shutter for Hand Camera.**—I have thought of making a hand-camera. Can any reader kindly suggest a useful shutter, one that does not work in the lens-mount, and also how to make a good, cheap finder? Also can anyone tell me a good and reliable way of arranging plates in the camera, and of removing exposed plates and leaving another ready for exposure? I do not want double slides. Will anyone who has had experience with hand-cameras please suggest a reliable instrument?—**INQUISITIVE.**

3855. **Canterbury Cathedral.**—Will some brother amateur kindly let me know whether permission is needed to "take" the interior of Canterbury Cathedral, and if so, to whom I am to apply? Any information as to exposures, etc., would be very acceptable.—**L. WILTSHIRE.**

3856. **Optimus R.R. Lens.**—Will any amateur kindly give me his personal experience of the Optimus rapid rectilinear lens, 5 by 4?—**B. WELLS.**

3857. **Solar Eclipse.**—Can I photograph the sun during the eclipse with a half-plate camera and single view lens, and if so which is the best way it can be done, and are there any other appliances required?—**TYRO.**

3858. **Lancashire and Cheshire.**—As I intend visiting Liverpool, Manchester, Chester, and some parts of the River Dee and vicinity for a few days, should be obliged for a list of buildings, etc., in the towns, and prettiest places in the country, suitable for hand-camera (fixed focus) work.—**J. F.**

3859. **Pinholes.**—Can anyone tell me how to spot out pinholes in a negative, as I want to make lantern-slides from it, and the pin-holes would show up large on the screen?—**J. F.**

3860. **The Lantern from a Window.**—I want to show some pictures out of a window; will any one kindly tell me the best and cheapest lantern to get, and how to fit up the window to show the pictures?—**N. P. L.**

3861. **Focussing Chamber.**—Can any one tell me whether Tylar's focussing chamber is a reliable and useful article? And whether it quite takes the place of a focussing cloth?—**S. R.**

3862. **The Eclipse v. Facile.**—Would some one

give me their opinion of Shew's Eclipse hand-camera? Is it superior to Fallowfield's Facile, new pattern?—**HYPO.**

3863. **Hydroquinone Developer.**—Would some amateur give me the formulae of a two solution hydroquinone developer which would keep some months in stoppered bottles? Have found Ilford formula go bad so soon.—**HYPO.**

3864. **Celle, near Hanover.**—Can anyone kindly inform me if I can procure plates and necessary chemicals for photography at Celle, near Hanover.—**C. B. FOX.**

3865. **Developing Tent.**—Will some reader with personal experience tell me the best portable developing tent. Can one be made or hired for two months' visit to Scotland.—**C. C. W.**

3866. **Aristotype Paper.**—How much gold (chloride) would be required to tone twelve whole-plate Aristotype paper?—**X. D.**

3867. **Isochromatic Plates.**—Will some brother amateur please say if I can develop Edwards' Isochromatic plates with Ilford developer? Will ordinary sensitised paper do for the printing? If not, please say what developer will answer, and what kind of paper, and what kind of toning and fixing bath is used?—**W. N. A.**

3868. **North of Spain.**—I intend spending about a fortnight or three weeks in the North of Spain early in June, making San Sebastian my headquarters, and as I have not been there before, and my knowledge of the language very limited, I should be very grateful for any information or hints which your readers who have been in that part of Spain could give me. Is photographing permitted in the churches and in the towns? Would the time of exposure for Wratten's instantaneous plates be about the same as in England in June?—**ENQUIRER.**

QUERIES UNANSWERED.

ANSWERS.

3813. **Dye for Canvas.**—The canvas you speak of is tanned, not dyed. You cannot prepare it at home, but can buy it ready for use.—**E. J. FIELDEN.**

3837. **Discoloured Prints.**—There is no satisfac-

tory means of restoring discoloured paper. — E. J. FEILDEN.

3638. **Transparent Films**—Are advertised by the Eastman Company.—E. J. FEILDEN.

3641. **Non-Achromatic Lens**—Try Perken, Son, and Rayment, Hatton Garden, E.C.—E. J. FEILDEN.

3703. **South Kensington and British Museums.**

—Yes. Apply to the Director.—E. J. FEILDEN.

3800. **Lens.**—In addition to what I said last week in reply to the numbers on "Vengeance's" stops, I think that most probably the numbers are those of the uniform system of the Photographic Society. These numbers give the number of times exposure the stop requires when compared with $f/4$ as unity. In this case the ratio of focus to aperture would be as follows:— $f/8.85$, $f/10.84$, $f/12.52$, $f/17.7$, $f/25.04$, $f/35.42$; and if the focus is 4 ins. the largest stop would be about four-ninths of an inch in diameter.

—J. G. P. VEREKER.

3802. **Exposure.**—Hinton's, 38, Bedford Street, Strand, W.C., will supply you with Wormald's Tables, price 1s. 6d.—Q.

3812. **Lens.**—Rapid rectilinear, with a focal length about the same as the plate you work with measures diagonally.—Q.

3817. **Developers.**—No; use either caustic potash or soda, 100 grs. to 20 ozs. of water. If washing soda is used, make a 10 per cent. solution, and add to developer as required.—E. J. FEILDEN.

3817. **Developers.**—Hydroquinone needs some preservative, such as sulphite of soda, and works well with carbonate of potash. I can recommend the following:—

Hydroquinone ...	...	...	80 grs.
Sulphite of soda ...	...	...	1 oz.
Citric acid ...	...	...	30 grs.
Bromide of potassium ...	...	...	10 "
Water ...	...	...	to 10 ozs.
Carbonate of potash ...	...	...	1 oz.
Water ...	...	...	to 10 ozs.

Use equal parts of each.

I have not experimented with washing soda.—Q.

3830. **Swansea.**—"Boy Amateur," on coming to Swansea, will find some very pretty views in the Old Park; also in and about Sketty, the old church making a very pretty picture. Some good views can be got at the Mumbles. The best time to take views here is about a couple of hours before sunset. If I am at home, "Boy Amateur" can change his plates in my dark-room.—J. F. WALLIS.

3830. **Swansea.**—H. H. Parly, 99, Mansell Street, keeps Ilford plates.—J. H.

3831. **Vignette.**—Take a piece of cardboard same size as printing frame, cut out the shape required with deep serrated edges.—E. J. FEILDEN.

3832. **Purple Tones.**—As regards gold solution stock—15 grs. gold, $\frac{7}{8}$ ozs. water—great mistake here. Try solution 15 grs. gold, 15 minims water. One minim equals 1 grain. Make a toning bath as follows:—1 gr. gold, 30 grs. tungstate soda, 8 ozs. water. Wash prints in changes of water for fifteen or twenty minutes; keep your toning bath, if possible, between 70 and 80 degs. All red colour should have disappeared, and purple colour to prints. Now bath for three minutes; 1 oz. salt, 1 pint water, 3 drops ammonia '880; follow hypo 2 ozs., 1 pint water, ten minutes. Soak prints for about fifteen hours, changing about three times or so. Don't splash from one bath into another. Keep your fingers clean.—PETER PIPER.

3832. **Purple Tones.**—If your negatives are of proper quality, and it is only from clear vigorous negatives that prints that will tone to a good purple colour can be obtained. I have no doubt that your toning bath is in fault, being much too poor in gold. Try doubling the proportion; if this does not prove a remedy, increase the strength in proportion of 1 gr. gold to 8 or even 6 ozs. of solution. Wash prints before toning in three changes of water, the second water to contain carbonate of soda, about 1 oz. per gallon. See also that your fixing bath is rendered alkaline by the addition of sufficient liq. ammonia to cause it to smell slightly. Read articles upon "Photographic Printing Processes," by Mr. Pringle, which have been appearing in this journal for some time.—F. W. G.

3833. **Plates.**—The sensitometer number of the Ilford ordinary is, I believe, No. 18, and is written on the labels of their plate boxes.—HYPO.

3833. **Plates.**—No. 18. It is on some of their labels.—SELF-TAUGHT.

3833. **Plates.**—Sensitometer number of Ilford ordinary is 18. It is on every box.—J. H.

3835. **Channel Islands.**—The best views are on the coast, and exposures must be shortened for these. Mont Orgueil Castle, St. Aubyns, and Corbière Point can all be reached from St. Heliers by rail; and besides these St. Ouen's Bay and Greve-de-Lecq should be visited. Luggage is examined on return to England. Guernsey and Sark are also worth going to.—F.

3836. **Norway.**—See the Ilford Company's "Scraps" for May. It gives considerable information of the subject.—J. H.

3837. **Toning and Fixing.**—Take a few practical lessons. If you have to pay for same, always money in pocket in the long run. Try the simple bath given in answer 3832.—PETER PIPER.

3837. **Toning and Fixing.**—You cannot use a

better paper than that made by the Blackfriars' Co. A good toning bath is made as follows:—

Gold Solution.		
Gold ...	...	15 grs.
Distilled water ...	...	15 drms.
Keep in the dark in a blue glass stoppered bottle.		
Bath.		
Powdered borax ...	...	45 grs.
Bicarbonate soda ...	...	45 "
Distilled water ...	...	10 ozs.

When dissolved, 1 drim. gold solution.

This bath will, if kept in the dark, remain good any length of time. Fixing bath, 4 ozs. hypo to 1 pint water, to which have been added 3 drops of liquor ammonia fort. '880.—E. J. FEILDEN.

3838. **Case for Camera.**—Waterproof canvas, with shoulder strap.—E. J. FEILDEN.

3838. **Case for Camera.**—I have used one of Lancaster's cheap canvas waterproof cases for two years, and have found it to be an efficient protector of camera, lens, etc., and very light.—HYPO.

3840. **Herne Bay.**—There is no place where plates are regularly sold, but I have no doubt Mr. J. Craik would oblige you. He would for a small fee allow you to use his dark-room at the Pier, also that at Canterbury.—E. J. FEILDEN.

3844. **Concentrated Developer.**—With the developer, but it is best kept separate.—E. J. FEILDEN.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED : AM : PHOT:

W. L. GROVES (Deal).—Thanks for yours. Messrs. F. Davis, F. W. Muncey, M. W., and the Hon. J. G. P. Vereker will be pleased to hear that you have found their letters of service to you.

J. R. CORMACK.—Enlargements are not admitted in the Monthly Competitions. We shall have a special competition for "enlargements" later on. Prints are to be mounted, not framed.

FIRMNESS.—Both useful cheap tripods. B will answer your purpose.

THOS. HARGREAVES.—We place them for your purpose as follows: No. 1, 9, 5, 8, 2. With No. 1 the R.R. lens will be found very fair. A, B make special lenses of short focus for hand-cameras.

F. G. M. BAKER (Trieste).—Glad to help you at any time. Thanks for letter, which we publish.

J. B. CHAPMAN.—The shutters we place 3, 2, 1, 7, 8. If C can be fitted with roll-holder, we should advise it. G has a roller, and is very compact, but is only made in very small size. Of the other cameras we should recommend H and A.

A. H. BLANKLEY.—The remarks had no reference to the crew of the *Hilda*.

H. D. TAYLOR.—The date will do nicely. MISS BEATRICE M. WILSON.—Thank you for the print from isochromatic plate. The subject is very faithfully rendered.

EDWIN H. JEFFREY.—Your photographs are very good, and the effect secured in several is exceedingly artistic. We were able to answer the queries that were required of "Q." and so the letters have been destroyed.

LAX.—We do not care for No. 1, or know of any special merit they may possess. No. 2, we do not know the camera.

G. R. (Corfu).—Your photographs would not stand a chance yet for prizes at exhibitions. No. 1 lacks definition, you should have used a smaller stop and prolonged exposure. No. 2, your foreground is not at all satisfactory; in fact, no subject in the picture is sufficiently bright and clear for a tree study, which should be sharp and crisp. No. 3 is not well-lighted. No. 4 is distinctly bad. If you send us particulars of photographs, such as light, lens, stop, plate, exposure, printing process, etc., we will try and help you. Both A and B are first-class lenses; we should advise you A.

M. R.—The (1) lens is not equal to (2), the (3) lens is good, and so are (1); but if price is not an object we should advise (2).

W. J. HARRISON.—Your request has been attended to.

W. MONKTON.—We will send "Travelling Studentship" Rules, and write you. MS. duly to hand.

W. H. ARMITAGE.—Our letter re "Lens" mentioned, which is a first-rate article, has been returned, through being wrongly addressed. Sorry if the non-receipt has caused you inconvenience.

J. F.—Various colours are to be secured with the plates you name. There is no need for the sky to

be plain white glass. We do not know the price of the tripod, and have no means of telling except asking the maker, which you can of course do.

AULD BREKIE.—Our own practice would have been to wash the negative before putting in the clearing solution. Send us one of the negatives with the stains, and we may be able to help you to take them out.

LOLA.—We know of no camera at the price you name that is reliable. The German-made camera that we have seen has a roll-holder, but we do think in practice it will be found reliable. We can not speak from actually using the apparatus, but only from the few experiments made with it when sent us for inspection.

G. W. COWAN.—For the Royal Parks write to Mr. H. W. Primrose, H.M. Office of Works, Whitehall, S.W., and at the same time ask the other question.

THOS. JAMISON.—We cannot help you. Why not write to the maker? They are advertised to give "full latitude of exposure from very rapid to slow or prolonged."

T. C. BUSH.—We are reporting to Mr. Gardner. J. C. DAWSON.—We will finish with Mr. Bulmer. The firm you name are not prompt in business, but are, we believe, thoroughly trustworthy.

MOYLE.—The following is the order in which we place the lenses—2, 1, 7, 3, 4, 5, 6, 8. We should advise the lens of larger focus.

REG.—We insert your letter under your own name, and should say you might well get up a society. Why not ask Major J. F. Nott to be President?

E. J. FEILDEN.—Very well indeed, we should think. Will you let us see your scheme, and give us a call one Monday or Thursday?

PONTRESINA.—For Swiss scenery, open views, especially if among the mountains, you should make rapid exposures. With the plates you mention you can stop one lens down to $f/11$, or even to $f/16$, under suitable conditions, and get good results with the shutter working at a moderate speed. In development great care must be exercised in order to get out detail and prevent hardness. (1) With equivalent stops the exposure of the two lenses is the same. (2) If you are accustomed to any particular formula, and find you get on well with it, have it made up in a very concentrated form, so that two small bottles in wooden protecting boxes can be made to serve your purpose. (3) Hypo can be bought in nearly every town in the country you mention; but the quality is frequently so inferior that it is best to carry some with you. By economising it a little it can be made to go a long way.

TOM TRUMB.—(1) The prints appear to have been left a little too long in the toning solution, and then they probably carried over a certain amount of acid to the fixing bath, which, of course, became excessive after a number had been immersed, hence the yellow colour you speak about. (2) Stop the toning earlier, and make the hyposulphite bath distinctly alkaline. The spots and discolorations on the prints seem to be the result of using dirty dishes, or ones which have previously been used for developing negatives with pyro. (3) About the same as for ordinary silver-printing. (4) Yes, but the matt-surface paper is the best for the purpose.

J. PRICE.—From our experience we think the eikonogen had better be added when the solution is cold. If dissolved in the hot water to the point of saturation, it will, of course, throw down crystals as the water cools. Try filtering the solution, and keep it well corked up. We cannot trace your other letter.

A. B. C.—Hinton's.

ENQUIRER.—Inserted in "Query" column.

A. E. BIRCH.—We will register your application, JOSEPH S. THOMSON (Dublin).—We shall be pleased to see you. Will do what we can to help you.

A. H. KINSEY.—There are no exhibitions coming on at present. Every exhibition is noted in the AMATEUR PHOTOGRAPHER.

TENNIS RACQUET.—Mr. J. J. Spink, of 21, Witham Street, Herne Bay, will give you every information.

First Ladies' Photographic Competition.

"Rose Wood.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within two DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, vols. vii. and viii., bound, perfect condition. Decoudun's photometer, for sale or exchange; what offers? — Wm. A. Jackson, 1, St. Vincent Place, Glasgow.

Cameras, etc.—Whole-plate mahogany camera, rack and pinion adjustment, extends 18 ins., closes to 3½ ins., swing-back, reversing frame, rising front, one double dark-slide, very light and portable, perfectly new; £3 10s.; half usual price; on approval if desired. — D. Padgham, Northiam, Sussex.

Half-plate camera, three dark-slides, 50 numbers AMATEUR PHOTOGRAPHER; exchange quarter-plate Instantograph. — Graham, New Lanark.

Lancaster's quarter-plate 1889 Instantograph, double back, printing frames, developing dishes, roller, and carrying case, complete; 42s. — Dickinson, 3, Ivy Street, Salisbury.

Camera and Double Backs.—Half-plate camera, best Spanish mahogany leather bellows, long extension, rising, falling, and cross fronts, double swing-back, with rack and pinion arrangement, reversing frame, rack and pinion adjustment, with 3 double dark-slides; the whole brass-bound throughout; cost £10 10s.; will take £5.—Apply, H. W. Fielden, Barbican Court, Barbican, E.C.

Camera, Lens, etc.—Wratten and Wainwright's whole plate camera, three double backs, Ross' rapid symmetrical lens, all in perfect condition, leather case, printing frames, lamp, chemicals, measuring glasses, etc., etc.; net cost, £17 8s.; price £21.—Apply, James McConell, 2, Eaton Place, London.

Hand-Cameras.—Kodak detective camera, equal new; cost 105s.; price 55s. lowest; or exchange with cash for Dallmeyer half-plate R.R. lens.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Marion's Parcel camera, six plate-holders and shutter, smallest quarter detective, splendid fixed focus lens; cost 80s.; price 35s.; or offers in cameras.—Box 43, St. Helens, Lancashire.

Second-hand Watson's hand-camera, leather-covered, Iris diaphragm lens, with quarter-plate roll-holder, all in good condition; £6 10s. Also

second-hand Watson's hand-camera, leather-covered, Iris diaphragm lens, and three double slides; £7.—Can be seen at Stereoscopic Company's, 106, Regent Street, W.

What offers for my quarter-plate Eureka hand-camera, covered with black leather, cost £7 3s. (by Rouch), only used seven times?—Sutton, 21, Waterloo Place, Upper Leeson Street, Dublin.

Hand Cameras, etc.—Quarter-plate Artist hand-camera, with excellent lens, in lock-up leather case, and with tripod; complete, in perfect condition; for six guineas; cost double. — T. M., Cotswold, Cirencester.

Lantern.—Lantern, enlarging and exhibition, four-wick, 4 in. condensers, unused; cost 50s.; price 40s.; approval.—Hunt, 5, Queen's Crescent, Glasgow.

Lenses.—Optimus Ruryscope, used once, perfect, 7 by 5; 70s.—Round, St. Thomas's Hospital.

Portrait (cabinet) lens, full aperture 1½ ins., front combination 10 ins., capital view lens, lenses 1½ ins.; 20s. only.—R. Ferns, Liscard.

Marion's 8 in. focus rectilinear splendid lens; cash 30s.—Parlow, 16, Victoria Street, Triangle, Hackney.

Lancaster's half-plate instantaneous lens, Iris diaphragm; £1.—Summers, 148, Stanstead Road, Forest Hill.

Lenses, etc.—Lancaster's half-plate instantaneous lens, fitted with Iris diaphragm and shutter; 20s.—Lowson, 16, Westborough, Scarborough.

Lancaster's quarter-plate Instantograph lens and shutter; price 14s. 6d.; approval; deposit; new.—Lee, 1, Whitestile Road, Brentford, W.

Organ.—Peerless pneumatic organ, with 20 pieces music; cost six guineas; would exchange for good half-plate set. — T. B. Walshe, address with Publishers, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C.

Retouching Desk.—Marion's retouching desk, never used, quite new; cost 50s.; price £1.—Mrs. Bennett, Cadbury House, North Cadbury, Bath.

Sets.—To be sold, cheap, half-plate bellows camera, four double dark-slides, tripod.—MacManus, Athlone.

Half-plate camera (by Photographic Artists' Supply Association), R.R. lens, three double dark-slides, in solid leather case, tripod stand; price £7 10s.; on view.—E. T. Ward, Winchester House, E.C.

Mayfield's 3½ in. square camera, R.R. lens in case, walking-stick tripod, three double backs, splendid condition; 75s.; approval; deposit.—Birton, Bisham Gardens, Highgate.

Half-plate Lancaster's Le Meritoire camera, complete outfit, consisting of lens, one double back and tripod, quite new; cost 63s.; will sell for 50s., or exchange 8½ by 6½ Optimus lens. — Elphick, 57, Stonefield Road, Hastings.

Half-plate photographic set, complete, 50s.; cabinet burnisher, 13s. 6d.; magic lantern, 35s.; scenic background, 20s.; terrace accessory, 15s.—2, Peter's Street, Dereham Road, Norwich.

Wooden half-plate camera, perfect condition, 10s., large powerful lens for same, 15s.; two tripod stands; folding into small space for whole-plate camera, 7s. 6d. each; one view-finder, 5s. — Mrs. Martin, Mariborough Hall, Norfolk.

Half-plate square Tourist camera, with 3 double backs and Eastman's roll-holder, 33 unused exposures, Swift's 14 in. landscape lens, with Iris diaphragm, Thornton's shutter for time and instantaneous, in good condition.—Address, Balty, office of AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C.

Sundries.—New mechanical ruby lamp, photometer, and large pair scales; sacrifice, 12s. Wanted, studio stand, head rest, and quarter camera.—A. D. Clarke, Pailton, Rugby.

Tripod, Telescope, etc.—Oak sliding tripod, exchange for half-plate instantaneous shutter; also old marine 6-lens telescope (by Louis Woolf, Liverpool), exchange anything useful. — J. Cuesar, St. Margaret's Station, Twickenham.

WANTED.

"Amateur Photographer," No. 6, vol. 1, Nov. 14th, 1884. — A. M. and W. Clark, 53, Chancery Lane.

Backs.—Two half-plate Instantograph (Lancaster's) backs, at once, cheap.—M., Avenue House, Chapel Street, Gosport.

Cameras.—Good portable whole-plate camera, all modern adjustments, cash or exchange.—A. Stradling, Cirencester.

Half-plate camera, with all modern improvements, lowest price for cash; approval. — Hugh Walton, Ironmonger, Alston, Cumberland.

Camera Case.—Good whole-plate camera case, cheap; give inside dimensions. — MacManus, Athlone.

PLEASURE CRUISES to the LAND of the MIDNIGHT SUN.—The ORIENT COMPANY'S steamships GARONNE (3,876 tons) and CHIMBORAZO (3,847 tons) will make a series of TRIPS to NORWAY during the season, visiting the finest fjords. The dates of departure from London will be as follows, and from Leith two days later:—

June 4th, for 15 days	July 15th, for 15 days
June 18th, for 27 days	July 23rd, for 27 days
June 25th, for 15 days	Aug. 8th, for 21 days

The steamers will be navigated through the "Inner lead"—i.e., inside the fringe of islands off the coast of Norway—thus securing smooth water; those of the 18th June and 23rd July will proceed to the North Cape, where the sun may be seen above the horizon at midnight. The Garonne and Chimborazo are fitted with electric light, hot and cold baths, etc. Cuisine of the highest order.

Dark Room provided for the use of Photographers.

Managers, F. Green and Co., 13, Fenchurch Avenue; Anderson, Anderson, and Co., 5, Fenchurch Avenue, London, E.C. For further particulars apply to the latter firm, or to the West End Agents, Grindlay and Co., 55, Parliament Street, S.W.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITION.

No. 13.—LANDSCAPE OR SEASCAPE.

Prizes—Silver and Bronze Medal with Ribbon and Clasp.

ONE PRINT ONLY. Must be sent in on or before the 14th of June, endorsed "Monthly Competition," etc., to

[PRICE TWOPENCE.]

OUR VIEWS.

To hold as 'twere the mirror up to nature."—Shakespeare.

THE Editor of the *Photographer*, published in Glasgow, is kind enough to send us every month a copy of his journal, which has news of an interesting character, and contains a *rechauffé* of the month's photographic doings. We note from it that Herr H. F. R. Voigtlander, the head of the firm of Voigtlander and Son, has just received the honour of knighthood at the hands of the Emperor Francis Joseph. Mr. George Mason continues his articles on "Dry Plate Photography for Beginners," and in the issue under review carefully describes Liesegang's aristotype printing-out paper, with formula for toning, etc. A very capital illustrated description of Swinden and Earp's camera is also published. Those who have not seen this magazine should write for a copy.

* * * *

WE are pleased to announce that there are thirty-five entries for the "Ladies' Photographic Competition;" this must be considered highly satisfactory. The judges will be Mrs. Eveleen Myers, Miss Edith Scannell, and Miss Ida Verner. The awards will be made public in our issue of the 20th of June. Much care has been displayed in preparing the photographs for the Competition; many of them are of very high excellence.

* * * *

AN ingenious calculator has pointed out that for the English Automatic Photographic Company to take only £30,000 a year from photography would require about 7,200,000 people being taken.

* * * *

THE popularity of photography is again shown by the fact that at the Royal Victoria Hall, Waterloo Bridge Road, S.E., Dr. J. A. Fleming delivered a lecture, entitled "How a Photograph is taken," to a large audience of the working and labouring class resident in that vicinity. The lecture was listened to with much attention, showing that the knowledge of "how to take a photograph" is keenly appreciated.

AN intrepid lady named Miss Kate Marsden has just received official permission, through the influence of the Czarina of Russia, to visit all hospitals, prisons, and places where information connected with the study of leprosy in Russia, Siberia, the Caucasus, and Asiatic Russia can be obtained. She will also have opportunities, as an amateur photographer, of placing on record the various types of this terrible disease, and the camera may, in company with the pen, thus help in its extermination.

* * * *

LAST Friday, on the occasion of the *soirée* given by the Photographic Section of the London Chamber of Commerce to inaugurate the exhibition at the Drapers' Hall, there was a very distinguished company. In another column we give a report of the proceedings at the function on Friday, and also a review of the apparatus and photographs exhibited. In the exhibition there is positively nothing new, save and except the Cyliodograph camera, which is likely to work a revolution in the method of "taking views." The range of view taken by this camera being covered by half the circumference of a circle. We shall hope to publish a full description of the apparatus and its capabilities. The promoters of the Drapers' Hall Exhibition have been very desirous that it should be known that the exhibits were entirely those of traders and professional photographers, and that no assistance had been rendered by the amateur to get up the Exhibition. On Friday evening there were very few amateurs present, or, in fact, many photographers except the exhibitors, their friends, and the editors of the Photographic Press; the rest were City people, few being versed in photography. We strongly advise our readers to visit the Exhibition. If there is little that is new exhibited, it is not every day that the palatial halls of the Drapers' Company are thrown open *free* to the public. But whether the Exhibition will be a success as a business enterprise we cannot say. It does not strike us that many people will go into the City with the idea of buying, or even selecting cameras, etc., to buy.

TRAVELLING STUDENTSHIP COMPETITION closes June 14th, 1890.

In the bright days of June, as we have said before, the professional is too busy, and the amateur will rather wander, camera in hand, on the banks of the river or stalk cattle on the hills, than *do* a photographic exhibition in the City of London.

* * * *

WE devote considerable space to Mr. F. D. Bulmer, and feel sure that many of our readers will, after perusal of the excerpts from the selected letters, give him a wide berth. It will be seen that the makers of apparatus hold him in about the same esteem as do the customers he has given so much trouble to.

* * * *

WE have another matter to bring under the notice of our readers. For some time subscribers have asked questions as to hiring apparatus, and a Mr. Batten kindly volunteered to give the address of a firm. We have sent on many letters to Mr. Batten, and now find that he is working in collusion with a Mr. C. A. Baines, financier, etc., London, S.W. This gentleman has struck the brilliant idea that in addition to selling on his "New Payment System," diamonds, gold and silver watches, furniture, soft goods, glass and china, carriages, perambulators, etc., and advancing money in loans from £2 to £50, he would take up the sale of photographic apparatus. His terms are "one-third of the amount down with the order, and the balance by equal monthly payments. If you are not a householder, I require two as sureties." This man is to all intents and purposes a "tally man" and money-lender. We caution our readers against doing business with him. We shall be careful how we accept answers from Mr. Batten in future, and are very sorry for the trouble and annoyance he must have given many of our readers.

* * * *

WHEN we drew attention to the Photographic Salon to be held in Vienna, we inadvertently named the Vienna Photographic Society as promoting the Salon. As a fact, the idea has been conceived, and will be carried out by the Executive of the Vienna Club of Amateur Photographers. There would seem to be a very certain success in store for the club. Herr Carl Ulrich, a Vice-President of the Club, is in England at the present time and has interviewed many of the leading photographic workers. There is every reason to believe that this country will be well represented. The Salon will be under the immediate patronage of Her Imperial and Royal Highness the Archduchess Maria Theresa.

* * * *

WE are pleased to note that a club has been formed at Enfield under the presidency of Mr. D. G. Pinkney. There are many of our readers resident in and around Enfield, and we would suggest that they communicate with the Hon. Secretary, Mr. James Dudin, Roseneath, Chase Green Avenue, Enfield, who will forward them particulars of membership, etc.

* * * *

NEXT week we shall hope to give an account of the pictures now being exhibited at Hexham by Mr. J. P. Gibson. We have several times drawn attention to the beauty and perfect work done by Mr. Gibson. At Hexham he is show-

ing some 400 pictures—a truly wonderful collection for a "one-man" exhibition! In pure landscape photography Mr. Gibson stands unsurpassed.

* * * *

THE article in the next issue of the PHOTOGRAPHIC QUARTERLY, by Mr. F. Bligh Bond, entitled "Photography in Natural Colours," will be illustrated by a chromo-collo-type printed from negatives made sensitive to certain rays of the spectrum, full particulars being set out in the article. The work is being done for us by Messrs. Waterlow and Sons.

* * * *

WE noted in our issue of May 16th the initiation, at the instance of Mr. Andrew Pringle, of an organisation at Eton College, for the study of photography by the boys. The lead has already been followed by another public school, to wit, the Whitgift Grammar School of Croydon. On June 2nd a course of twelve lectures, with demonstrations, was begun by a prominent member of the Croydon Camera Club. Already sixteen students have joined the class, and several others are expected to avail themselves of the opportunity afforded of becoming well grounded in the fundamental theories and processes of the art-science.

* * * *

OUR Liverpool District Editor advises us that Mr. Paul Lange, President of the Liverpool Amateur Photographic Association, is about to proceed to Iceland in the British Yachting Company's s.s. *Myrtle*, to take a series of 200 views in that almost unphotographed country. If the photographs taken are on a level with Mr. Lange's well-known views of Norway, they will indeed be a welcome addition to view-photography.

* * * *

THE Travelling Studentship Competition closes on Saturday, the 14th inst. All intending competitors should *at once* apply for rules and entry forms, and we must ask that the competing photographs be sent to us as early as possible.

* * * *

FROM the tenor of the numerous communications that reach us from time to time, and from circumstances which come under our own personal notice, we are led to conclude that although amateur photographers have hitherto shown themselves to be a long-suffering and patient race, the limit of their endurance has nearly been attained, and if hereafter vigorous measures are adopted for their own protection against the unreliable tradesmen with whom they have had to deal, a careful review of the facts that may give rise to any combined action similar to that indicated will be ample justification for such mutual co-operation. It will also tend to convince photographic dealers that their methods of business cannot for ever be successfully carried out when they in any way go counter to the doctrine inculcating the fact that "honesty is the best policy"—in the long run, at any rate. It requires now but a very short experience of photographic work for the amateur to discover the fact that he is almost entirely at the mercy of a certain class of business men, also that perfectly trustworthy dealers in the commodities he requires are, to put it mildly, not as numerous as he might reasonably desire. Further, even if, after selling him

worthless goods and causing him expense and annoyance, a word or two of regret, backed by some desire to make any amend possible, were forthcoming with any spontaneous alacrity, perhaps the grievances would not rankle so keenly as they do; but as it is, we are forced to admit that on various occasions information has reached us that the victims of this method of business have had to remind certain firms that by becoming amateur photographers they had not placed themselves outside the pale of law, and that perhaps an appeal to a court of justice might convince a vendor of spurious articles of this fact, which they apparently find it convenient to ignore.

With a full knowledge of the circumstances, we feel safe in asserting that there are few amateurs of any standing who do not annually pay away a percentage of the total cost of their hobby for worthless goods. Many men have sold their cameras and ceased the practice of the art for no other reason but the unreliability of dealers, their exasperation being increased by the knowledge that the margin of profit on the class of goods sold is ample to warrant articles of the very best quality being supplied, as evinced by the fact that firms who a few years ago were conducting small and insignificant businesses in side streets, are now owners of extensive premises in main thoroughfares, and from exhibiting a pleasure in making new customers, they now consider their dignity enhanced by making it appear they are conferring a favour by accepting an order. Bleeding the amateur photographer has wrought many such changes in condition as here indicated, and in return we think in fairness it must be acknowledged he is now justified in maintaining that in future he is entitled to be fairly dealt with.

In no other branch of science or art are its disciples so completely at the mercy of the firms with whom they deal, as photographers. In the matter of plates alone, not only are they very expensive articles to purchase, but in buying them entire reliance has to be placed upon both the vendor and the manufacturers, for even if originally packed in good condition bad storing will accomplish their ruin. Large sums may again be expended upon travelling to distances in order to obtain the negatives for which the plates were procured. The disappointment resulting from any failure in procuring the desired photographs, arising through being supplied with worthless plates, is heightened by the knowledge that time and money have both been expended in making a fool's journey for which no compensation can be forthcoming, the exasperating annoyance being further increased by the feeling that, as things are at present, the victim of such a contretemps cannot obtain any satisfactory insurance against the repetition of a similar experience. Of course, accidents will happen now and again, even when the greatest care is exercised, but under such circumstances honest tradesmen will do all they can to soothe the annoyance caused thereby when they are shown to be responsible. But we are referring to facts within our experience when we state that, even with unmistakable evidence of the worthlessness of the plates palmed off on the unsuspecting victim, complaints have on several occasions simply elicited impertinences which have on certain occasions amounted to positive insults.

Moreover several of the firms who doubtless consider they have reputations of unquestioned respectability would hardly like to hear some of the remarks now and again made by certain of their customers. Their special camera, or plate,

or developer may be all right, a source of profit to themselves and of pleasure to the purchaser when using it, but it is not solely by the aid of such articles that photographs can be made. The photographer has to rely upon numerous requirements of minor value, whose quality may be of vital importance to the finished result of his labours, and it is frequently in these small articles that even the best firms do not hesitate to palm off worthless rubbish in order to make a little extra profit. Photographers understand fully what we mean, and know how difficult it is to be certain of procuring, say, pure chemicals, or those of standard strength, sensitive paper perfectly fresh, cutting glasses correctly squared, lantern masks trimmed properly, cover glasses without flaws, slide binders that will stick, and so on through the long list of what may be called minor necessities. But the experiences of many are not confined to this kind of annoyance alone, for even when purchasing the more expensive portion of photographic apparatus, the mendacity of some firms will provoke the keenest disgust. He is, indeed, a fortunate man who has not been told, in order to induce him to make a purchase, that a camera and slides have been thoroughly tested, and then, relying upon this or similar statements, has taken the apparatus out for a day's work, the result being the discovery that the camera leaks light in various places, or that the regulation of his exposures has been faulty through the incorrect manner in which the lens stops have been marked, or he has found that the dark slides were not in register with the focussing screen. Without further enumerating the troubles arising from untrustworthiness or intentional carelessness—for every one of our readers who employs a camera can, without doubt, continue the list from his own experience—we may say that the amateur photographic fraternity are now beginning to find out that they have the remedy to some extent for this state of things in their own hands. This remedy they will undoubtedly have to put into operation, unless the dealers, as a body, will on their part engage to supply articles with an implied guarantee of quality, and not only state their willingness to rectify to the best of their power any mistake that may arise, but do so without demur directly their attention is drawn to the matter.

In the interests of both parties we have felt constrained to speak forcibly upon this subject, and shall again refer to it, for we are determined to assist to the best of our power the class in whose interests our journal has been established, and to do what we can to obtain for amateur photographers a fair return for their outlay; also to try and prevent as far as possible the useless expenditure, exasperating disappointments, and ensuing disgust with the practice of the art-science, resulting from the method of conducting business which some firms have seen fit to adopt. Fortunately, our strictures cannot apply to many firms of standing, and in order to fulfil our mission we may, if the complaints continue to increase in the ratio they have done lately, have in common fairness to be more specific in our charges.

—♦♦♦♦♦—
CARDIFF AM: PHOT: SOC:—On Saturday last a strong contingent started from the Studio in breaks to this historical place. By the kind permission of Mrs. Nichol Carne, the castle and grounds were thrown open, consequently plenty of work was soon found for the visitors, and a most enjoyable afternoon was spent. On the return journey the visitors dined at Llantwit Major, and reached Cardiff all well at 11.30.]

Letters to the Editor.

CHEAP HAND-CAMERAS.

SIR,—The letter of "F. G. B." of Trieste, in your issue of the 9th May, does not seem to have elicited any information likely to be of service in the direction required.

Other correspondents endorse the remarks of "F. G. B." as to the need of an inexpensive hand-camera, and an enterprising firm secures an opportunity of advertising their special make of cameras, but this result is scarcely satisfactory, and, as I am able to speak favourably of an inexpensive hand-camera, I venture to trespass on your space. A few months ago I purchased one of the "Guinea" hand-cameras invented and manufactured by Mr. Walter Griffiths, of Highgate Square, Birmingham, and after thoroughly testing it, I can conscientiously say that the results are equal to those of the most expensive hand-cameras I have seen.

The camera contains three double dark slides for quarter-plates, and its construction is so simple that the most inexperienced tyro can work it.

In appearance it is like a small sample case $8\frac{1}{2}$ inches long, 5 inches broad, and $6\frac{1}{2}$ inches deep, and it is covered in black waterproofing cloth.

The front lets down for the purpose of setting the shutter, but when ready for work, the shutter is liberated by moving a small catch at the bottom.

I have taken snap shots in one-sixteenth of a second, and interior views in 60 seconds.

An object not less than eight or nine feet from the camera is depicted with sharpness and full definition. The focus is a fixed one.

I shall be happy to write fuller particulars at a future date if required, and to send you some specimens of pictures taken with the "Guinea" camera,—Yours, etc.,

C. E. SCARSE
(Chief Librarian, Birmingham Library).

NOTE.—Perhaps Mr. Griffiths will send us a camera for inspection.—ED:
"AM. PHOT."

SIR,—“F. G. B.” has with commendable generosity given his unqualified approval of the No. 1 Kodak, but he seems to have been stung into a fit of uncontrollable rage by my reference to his uncalled-for and insolent charge against American trade traditions.

“F. G. B.” asks three questions :

(1) What is the actual cost of production of a Kodak No. 1 lens?

(2) What is the actual cost of production of a finished Kodak No. 1 that is sold for five guineas?

As I am not the accuser in the present discussion, I see no reason why I should supply information to my adversary.

As to an explanation of my sentence beginning, “The Eastman Company gave *carte blanche* to two of the most respected and successful manufacturers of photographic objectives in Great Britain,” etc., I have no possible objection to giving the names and addresses of both firms, whenever “F. G. B.” cools down sufficiently to permit him to request the information in ordinarily civil language.

No doubt my education is sadly defective, but it is quite sufficient to prevent me from following any man in a vituperative contest.—Yours truly,

WILLIAM H. WALKER.
The Eastman Photographic Materials Co., Ltd.,
115, Oxford Street, London,
June 2nd, 1890.

* * * *

LIGHT IN THE DARK-ROOM.

SIR,—In my letter of the 12th May, under the above heading, it appears I omitted to make clear a point which at the time seemed too self-evident to need further explanation.

The point I refer to is the nature of the danger incurred where an insoluble compound of hypo is allowed to form during the process of fixing.

I need hardly state, even to the veriest tyro, that an insoluble compound, as, for instance, the above, is quite impervious to the attack of water—*ergo*, no amount of washing will eliminate it. We have, therefore, a residue containing a large proportion of

sulphur in close proximity to the silver deposit forming the image. This residue is particularly liable to decomposition by acids and acid vapours, with liberation of sulphur compounds, the latter acting as more or less powerful bleaching agents.

Silver prints are perhaps more subject to this danger than negatives, and thus premature discolouration and fading is too often owing to acid impurities in mounts and mountants.

Fortunately, the remedy for the above evils is obvious—“Fix only in non-actinic light.”—I am, yours faithfully,

May 26th, 1890.

C. J. DAVIES.

* * * *

BIRKENHEAD V. BIRMINGHAM.

SIR,—Will you kindly insert the enclosed copy of letter which I have this day forwarded to Mr. Reader, of the Birkenhead Society, in reply to his of the 19th inst, and much oblige, yours truly,

J. H. PICKARD.

[COPY OF LETTER.]

361, Moseley Road, Birmingham,
May 30th, 1890.

Dear Sir,—I duly received your letter of the 19th, which I see also appeared in the photographic press before I could have had time to reply to it.

The Birkenhead Photographic Association appears to have produced a set of lantern slides illustrating some of the archaeological features of the Hundred of Wirral, exhibited for the first time a month or two back. On this fact you claim for that Association—(1) Originality for the scheme which the Birmingham Photo Society have in hand for the photo survey of Warwickshire; (2) To have been the first in the world to undertake such work; (3) That the survey of the Hundred of Wirral is an accomplished fact. On all these three points I must say that you are altogether in the wrong. Piecemeal work of this kind has been done by societies, by individuals, and by commercial firms ever since the discovery of Daguerre was published to the world in 1839.

The President of our Birmingham Society, J. B. Stone, Esq., caused an archaeological survey of the Hundred of Hemlingford, in North Warwickshire, to be executed twenty-five years ago, and the hundreds of 15 by 12 negatives then produced are in his possession. His monograph on “Lichfield Cathedral,” published in 1870, and for which almost every stone of the building was photographed, was a similar work on a smaller scale.

But hundreds of similar instances could be given. Why, our own collection of lantern slides illustrating some of the principal features of the county of Warwick was exhibited in Liverpool some months before the lantern slides of Wirral, which you consider to represent a county photographic survey, were completed.

It appears to me that your letter is based upon a complete misconception of the nature and scope of the work we hope to do in Warwickshire. Yet our ideas are fully expressed in the paper read by our Vice-President, W. Jerome Harrison, Esq., F.G.S., which was published in the AMATEUR PHOTOGRAPHER, in the *Photographic News*, and in the *British Journal of Photography*, etc., etc., during December 1889, and which has been reprinted in pamphlet form and distributed (to the extent of 1,000 copies) among photographic societies and photographers generally. A copy was, I believe, sent to you, and if you will carefully read it you will see it contemplates something very different from the production of a set of lantern slides. The points which we consider essential in our survey scheme are—

1. That the unit of area should be the *county*, a district well known to every Englishman.

2. That a County Council should be formed, which should organise the work to be done by the different photographic societies in the county.

3. That the other local societies—scientific, literary, and artistic—should be asked to assist in the scheme, and be represented on the Council.

4. That workers generally—who may not belong to any society, or who may know nothing of photography—may join a survey “section,” and thereby assist in the work in one way or another.

5. That the Ordnance six-inch map be taken as the working map for the survey.

6. That the principal objects of the survey be to illustrate (1) archæology, (2) architecture, (3) landscape scenery, (4) ethnology, (5) botany, (6) geology, (7) town life of the county.

7. Old engravings, documents, etc., relating to the county are to be copied.

8. The collection as far as possible, and the preparation and publication of as complete a list as possible, of all local negatives already in existence, referring to the points mentioned in (6). It is believed that some thousands of such negatives are already in existence.

9. The production of prints in platinotype from the negatives

obtained, the said prints being bound in albums of which sets shall be preserved in the Society's library, in the local free libraries, and in the British Museum.

10. The publication—quarterly or annually—of a selection of the prints obtained.

These are some only of the points we consider essential to any project which is to be dignified by the name of the "County Photographic Survey;" and for further details I must again refer you to Mr. Harrison's pamphlet. I estimate that the members of our Birmingham Society have already in hand about 1,000 negatives which have been taken during the last five years with an eye to the survey work.

During the next two or three years it is probable that about 3,000 negatives per annum will be taken specially for the Warwickshire Photographic Survey, and we shall then consider that we have fairly commenced the work. Its completion will, we hope, occupy us for the rest of the century, and after that it will afford occupation for generations of photographers yet to come.

I trust that your Birkenhead Society will work out a similar task, and not imagine that the production of a set of lantern slides, illustrating a part of one subject of a part of a county is anything more than an extremely small instalment of so great a work.—Yours truly,

Chas. B. Reader, Esq.

J. H. PICKARD.

P.S.—I am compelled to send a copy of this letter to the AMATEUR PHOTOGRAPHER, as your letter to me has already appeared therein; but I think that it is setting a very bad example for photographic Societies to attack one another through the photographic Press, and must decline any further correspondence.

MEDALS AT THE CRYSTAL PALACE.

SIR,—I have this morning received a letter from the Managers of the late Crystal Palace Exhibition, saying that they will now forward me the second medal as soon as it comes from the engraver. I therefore hasten to let you know this, in order that my letter to you of a few days since may be kept out of your next issue, in fairness to those gentlemen.—I am, yours, etc.,

May 30th, 1890.

ARTHUR A. CARNELL.

* * * *

MR. C. HUSSEY AT FAVERSHAM.

SIR,—Your kindly notice (in your issue of the 30th ult.) of my paper read before the members of the Faversham Institute Photographic Society, unintentionally misrepresents my views on photography.

The points I endeavoured to impress on my audience were:

(1) That a photograph to be of permanent value *must* be artistic.

(2) That much may be done, even with topographical photographs, by choosing a good point of view, proper time of day and year, etc., to add to their artistic value.

(3) That the artistic excellence of many well-known and much-admired photographs (some of Mrs. Cameron's, for example) exists not in but in spite of their technical deficiencies.

(4) That by means of the new processes and perfected apparatus, and abundance of literary matter now at our disposal, manipulative skill is so easy to acquire that bad technique is altogether inexcusable.

(5) That, however good a photograph may be from an artistic point of view, its good qualities cannot be damaged, but rather enhanced, by perfect technique.

These opinions are, I venture to think, in accord with yours, sir, and those of most of your readers, and are hardly expressed by the phrase "dwelling in detail on the importance of technique," and I therefore beg the favour of a space for personal explanation in your columns.—I am, sir, yours faithfully,

Camera Club, 21, Bedford Street, W.C.,

CHAS. HUSSEY.

June 2nd, 1890.

NOTE.—The report was published as contributed to us.—ED: AM: PHOT:

SUPPORTS FOR WASHING PRINTS AND FILMS.—In a recent issue we called attention to the invention of Mr. T. Stanway, of Cauldon Road, Hanley, Staffordshire, for his supports to be used in the ordinary plate-washing rack. Those we have just received are an improvement upon those which were shown us. By their use it is quite impossible to tear the print or film. Mr. Stanway has also invented a very ingenious plate-lifter. For those who prefer not to have pyro stains upon their fingers, they will be found most serviceable.

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

(Continued from page 375.)

CHEMICAL NOMENCLATURE.

THE names given to chemical compounds should be as brief and simple as possible, but at the same time they must distinguish the particular compound from all others, and should be descriptive, *i.e.*, should convey as much information as possible concerning the compound and its relation to others. Nomenclature is largely a matter of convention and agreement, and is also dependent on the state of our knowledge. As a consequence the names of many substances have been changed, and we not unfrequently find one and the same substance with three somewhat different names. As our knowledge increases, nomenclature becomes more and more systematic, though the older names are dropped very slowly, especially in the case of substances which are in common use. The system which we shall use is that agreed upon by modern English chemists, but the everyday names of common substances will not be disregarded.

The name of a *binary compound*, *i.e.*, a compound containing only two elements, is formed from the names of the elements which it contains, the termination of the second name being changed to *ide*. For example, the compound of silver and bromine is called silver bromide; of silver and oxygen, silver oxide; of silver and sulphur, silver sulphide; of sodium and chlorine, sodium chloride.

When the same two elements form more than one compound their names are formed in the same way, but they are distinguished by giving a different termination to the name of their metallic constituent. In the name of the compound which contains the higher proportion of the metallic element (or the lower proportion of the non-metallic constituent) the termination of the metal is changed to *ous*; in the compound which contains the lower proportion of the metal, its termination is changed to *ic*. For example, the first compound of mercury and chlorine (p. 289) is called mercurous chloride, and the second mercuric chloride. The corresponding compounds with oxygen, one containing 400 parts of mercury and 16 of oxygen, and the other 200 parts of mercury and 16 of oxygen, are termed respectively mercurous oxide and mercuric oxide. When the Latin name of the metal is different from the English name, this alteration of termination is made on the Latin name; thus in the case of iron (ferrum) we have ferrous and ferric compounds; in the case of copper (cuprum) we have cuprous and cupric compounds; and in the case of tin (stannum) stannous and stannic compounds. For example, the first of each pair of copper compounds (p. 289) are known respectively as cuprous oxide, cuprous chloride, and cuprous sulphide, whilst the second of each pair is termed cupric oxide, cupric chloride, or cupric sulphide, as the case may be.

Formerly, instead of changing the termination of the first name, the prefixes *proto* and *per* were attached to the second name, *proto* meaning "lower," and *per* "higher;" thus, mercurous chloride was mercury *protochloride*, mercuric chloride was mercury *perchloride*, stannous oxide was tin *protoxide*, and stannic oxide was tin *peroxide*. These names are now rarely used.

The system just described is only available if the same two elements form not more than two compounds; where there are more than two, we have to use the numerical prefixes mono (one), di (two), tri (three), tetra (four), penta (five), hexa (six), hepta (seven), octa (eight), to indicate

the number of combining proportions of the element which are contained in the compound, or, accepting the atomic theory, the number of atoms of the element contained in a molecule of the particular compound. The first compound of tin and oxygen (p. 289) may be called tin *monoxide* and the second tin *dioxide*; the first compound of phosphorus and chlorine is called phosphorus *trichloride*, and the second phosphorus *pentachloride*. This plan can be followed in the case of any number of compounds.

Other points in nomenclature will be explained as occasion arises.

Chemical Formulæ.—Just as we use symbols to represent the elements, so we can use them to represent compounds. A *chemical symbol* is a letter or a pair of letters representing an *element*; a *chemical formula* is a collection of symbols representing a *compound*. The formula of a compound is written by placing side by side the symbols of the elements which it contains, and attaching to these symbols, if necessary, figures which indicate the number of combining proportions of each element which are present in the compound.

Mercurous chloride contains one combining proportion of mercury, and one of chlorine; its formula is HgCl . Mercuric chloride contains one combining proportion of mercury and two of chlorine; its formula is HgCl_2 . If the following formulæ are compared with the composition of the compounds as given on p. 289, and with the combining weights of the elements if necessary, the meaning and use of the formulæ will become evident: Stannous chloride, SnCl_2 ; stannic chloride, SnCl_4 ; phosphorus trichloride, PCl_3 ; phosphorus pentachloride, PCl_5 ; cuprous oxide, Cu_2O ; cupric oxide, CuO ; cuprous chloride, Cu_2Cl_2 ; cupric chloride, CuCl_2 ; cuprous sulphide, Cu_2S ; cupric sulphide, CuS ; stannous oxide, SnO ; stannic oxide, SnO_2 ; stannous sulphide, SnS ; stannic sulphide, SnS_2 .

Formulæ, like symbols, have a quantitative as well as a qualitative meaning. HgCl does not merely mean that mercurous chloride is composed of mercury and chlorine; it stands for 235.4 parts of mercurous chloride, composed of 200 parts of mercury and 35.4 parts of chlorine. PCl_5 does not stand for any indefinite quantity of phosphorus pentachloride, but for exactly 208.0 parts of the pentachloride, consisting of 31 parts of phosphorus and 177.0 (35.4×5) parts of chlorine.

The symbols of the elements, whether used alone or combined together in formulæ, always represent a definite relative quantity of the element for which they stand—i.e., its combining weight or atomic weight.

Formulæ have also a further meaning. The formula of a compound always represents *one molecule* of the compound, and tells us how many atoms are contained in that molecule. HgCl represents one molecule of mercurous chloride, containing one atom of mercury and one atom of chlorine; HgCl_2 represents one molecule of mercuric chloride, containing one atom of mercury and two atoms of chlorine; AgNO_3 represents one molecule of silver nitrate, composed of one atom of silver, one atom of nitrogen, and three atoms of oxygen; $\text{K}_2\text{Cr}_2\text{O}_7$ represents one molecule of potassium dichromate, composed of two atoms of potassium, weighing 39.1 each, two atoms of chromium, weighing 52.3 each, and seven atoms of oxygen, weighing 16 each. The number obtained by adding together the weights of all the atoms in a molecule of any compound is termed the *molecular weight* of that compound.

Chemical Equations.—Symbols and formulæ can be used to represent chemical changes in a concise and very convenient manner.

A **CHEMICAL EQUATION** is a collection of symbols and formulæ representing a chemical change.

The symbols and formulæ of the substances which take part in the change are written on the left-hand side of the equation, and are connected by the sign +, which means "together with," or "brought in contact with," and the products of the change are written in a similar manner on the right-hand side, the two sets of formulæ being connected by the sign =, which in these cases means "yields" or "produces." The following equations, representing the changes which take place in some of the experiments which have already been performed, will make their use clear, and the meaning of the symbols and formulæ will now be intelligible:—

The Electric Light and Photography.—IV.

By T. C. HEPPWORTH, F.C.S.

A CONVENIENT form of dark-room lamp and battery combined is that shown at fig. 1. This apparatus is, I believe, of French origin, but can be bought in this country of numerous dealers through the wholesale house of Messrs. Perken, Son, and Rayment. The drawing must be looked upon as being merely diagrammatic, and many unimportant parts are omitted so that the illustration shall not be unnecessarily encumbered.

The apparatus consists of a mahogany box nine inches in height and six inches square, and its outer edges are described in the cut by dotted lines. To the lower part of the lid of this box are fixed the battery plates, consisting of nine sets of three each, each three being represented by two carbons with a zinc plate between them. These plates are all connected by strips of metal, one pair of carbons being joined up with the zinc plate of the next cell, and so on throughout the series. The cells, of which only one is shown in the drawing, consist of tall glass bottles which seem at first sight to be out of all proportion to the plates which dip into them. But the reason for this apparent disproportion is to provide an excessive amount of exciting solution so that the battery shall preserve its energy for a long time without the necessity of recharging. In all bichromate, as, indeed, in most other batteries the plates should remain in the exciting solution only during the time when the battery is at work. In the bottle form of bichromate cell, the zinc is lifted out of the solution by means of a rod, and in this way all electrical action is stopped. In the apparatus which we are now considering, the plates are not lifted from the solution, but the cells and their contents are made to recede from the plates. This is brought about by a very simple arrangement of parts. The glass cells stand upon an iron platform which measures a little less than the interior width of the box, so that it will slide up and down therein with ease. It is hung upon two strong brass rods, the tops of which are tapped and project through the lid of the box. Collars here engage the screw thread upon each, and by simply turning these screws between the thumbs and fingers of the two hands at the

same time, the platform and the cells are raised or lowered as may be wished. It will at once be seen that this plan not only serves to put the battery in and out of action, but gives control over the amount of current afforded. For it is obvious that if the plates are only partially immersed in the liquid contents of the cell, the amount of current afforded will be in proportion. In the drawing, and for the sake of clearness, only the edges of three sets of plates are shown, but it will be understood that the square form of containing box affords room for nine. The lamp, or incandescent bulb, is contained, as shown, in a metal casing—which is silver-plated within so as to have a good reflecting surface, and which is closed in front with a disc of ruby glass. The lamp is attached to the body of the box in such a way that it can be raised or lowered as may be desirable. It is of 5 candle-power, and, owing to the great

FIG. 1.

capacity of the cells, it will continue active without recharging for several hours. It would be by no means an expensive form of lamp to use for such occasional purposes as the changing or examination of plates, or for development if the number of plates to be treated is not very great. The expense of recharging is not much, for a pound of bichromate, costing about 8d., and a similar quantity of acid at about a quarter that price, will last for several charges. The trouble and time is the expensive part of the process, which prevents the use of such a lamp by busy folks, but for the occasional uses which have been already indicated, it certainly is valuable.

It is, perhaps, unnecessary to caution photographers about the poisonous quality of the bichromate salt. Carbon workers have long ago found out that some people are peculiarly susceptible to its influence, and that if they are careless in allowing a solution of it to touch their skin, and remain there, it occasions painful sores which are difficult

to heal. Others seem to be able to dabble their hands continually in the red solution without suffering any harm or inconvenience. This is an instance of the presence of pachydermatous individuals among us who never feel anything, and seem to escape all the common inconveniences of life. It may be noted that the acid bichromate solution need not be thrown away after use in the battery, for it is valuable for cleaning glass vessels, and a small quantity of it should be retained for this purpose.

In electrical matters, as in most other things, a cheap and simple arrangement of parts is often far more effective in action than one which is complex and costly. In battery cells which are made commercially there are generally brass terminals and binding screws with which to make the necessary connections. These are ornamental, convenient, and pleasant to use, but in a short time, with some descriptions of battery, and notably with the Bunsen or grove cells, the fumes from the acid employed quickly corrode the metal, and all contact points have to be kept clean by continual use of the file. If this is not attended to the imperfect contact caused by the corrosion raises the resistance of the battery to such an extent that more than half its effective power disappears.

A convenient and simple method of joining metal wires to carbon plates without any expensive fittings has lately been patented by an officer of the Royal Engineers. It is illustrated in fig. 2. A hole is first of all bored in the carbon plate—a by no means difficult operation with a drill. The tool makes much dust, as the material is ground away by it, and it must often be taken out of the hole during the progress of the work. It should be used dry—that is, without any kind of lubricant. When the hole is complete, a short piece of platinum wire is thrust through it, and then bent back upon itself, as shown in the cut. No. 24 standard wire gauge is a convenient thickness of metal to use, and as short a piece as possible should be employed, on account of expense, platinum having recently, in consequence of the greediness of photographers, gone up in price about 150 per cent. Platinum is the only metal which can be used in this particular manner, on account of its stability in the presence of all kinds of acid solutions.

(To be continued.)

FIG. 2.

Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

HAND-CAMERAS.

(Continued from page 376.)

A PHOTOGRAPHER who has previously confined his practical experience to the manipulation of the ordinary photographic apparatus, when first essaying to employ a hand-camera should carefully bear in mind certain distinctions that exist in the method of working, and understand fully how the difficulties that arise in consequence can be successfully overcome. In the first place, the camera having to be held in the hand, an element enters into the calculations for the duration of the exposure which if the apparatus is fixed to a stand does not exist, for the time during which it can be held steady by the operator may necessitate the speed of the shutter being accelerated considerably beyond the point that would otherwise be deemed sufficient. This feature of hand-camera work being a purely personal one, no rules can be given. Some people rejoice in the posses-

sion of very steady hands, while others have very much the reverse, others, again, with a phlegmatic temperament can be sure of remaining steady under exciting circumstances for the duration of a period which the owners of nervous organisations under similar conditions would find utterly beyond their ability. As a rule, it can be broadly stated that in hand-camera work it is always advisable to give as long an exposure as possible, and to rely upon the judicious employment of the stops for any correction in this matter that the rapidity of the plates being used may necessitate. Consequently, those who aim at working in an intelligent manner should, by a few simple experiments, acquire some information about the time they can hold the camera steady, so as to insure a sharp picture resulting. This time will, with the average man, vary between $\frac{1}{4}$ and $\frac{3}{4}$ of a second; with an exceptionally steady man it may attain to a second. This information having been obtained, the lowest speed of shutter possible while the camera is held in the hand is practically settled; its acceleration will, of course, be based upon the rapidity of movement, distance, and line of travel the quickest moving object within the limits to be embraced by the photograph may necessitate.

Intimately connected with this subject of exposure is another one of equal importance, namely, the regulation of the aperture at which the lens should be worked. This point again influences another one, determining the character of the plate suitable for the work, about which we shall have something to say a little later. By lessening the aperture of the lens an equivalent reduction of its power of illumination is created, this feature being the one for which provision has to be made in selecting the plate; but it also gives the lens an increased power in creating what is known as depth of focus. Now any addition to this quality in a lens, for it materially affects the sharpness and clearness of the picture at all points, is one that in hand-camera work is deemed of special importance, therefore the smallest stop that the sensitiveness of the plate will allow when the speed at which the shutter must be set is taken into account, should be the one ordinarily employed. Hence, also, it follows that the shutter should be set to work as slow as is compatible with the existing circumstances, for it allows the aperture of the lens to be proportionately diminished.

The importance of this method of work arises from the fact that in a hand-camera where no power of focussing on to a ground-glass screen exists, the focus has to be regulated by certain points being marked on a scale; and by guessing the distance between the camera and the principal object, the adjustment of the focus considered correct is made. Now, it requires a very practised eye to do this in even an approximately correct manner. In ordinary cases this adjustment has to be made in a happy-go-lucky fashion at some point between the two extremes when any deviation from the distance at which all objects are in focus has to be made. Now in this rough-and-ready manner of focussing, it can easily be understood that it is a great advantage to have a lens in which, within certain defined limits, no great variation of adjustment has to be made, or, in other words, one in which a considerable margin of latitude in this matter of accurately approximating distances can be taken without any appreciable want of sharpness being visible in the negative. Therefore, as the smaller the aperture of a lens, the greater the depth of focus, the regulation of the stops affects the ease with which any deviations in focus can be made in an ordinary hand-camera, for its tendency is to increase the range of distances at which all objects are simultaneously sharp. For instance, with a 5-inch focus lens, all objects are in focus beyond 21 yards with full aperture, when the focal centre of the lens is fixed 5 inches away from the plate. If, however, the lens be stopped

down to $f/16$, the limit at which all objects are in focus is reduced to 15 yards. When working with full aperture if it becomes necessary to get an object 15 yards away sharp, the lens must be racked out $\frac{1}{16}$ of an inch, i.e., $5\frac{1}{16}$ inches from the plate. The value of the stops in this connection is, therefore, apparent.

This difficulty in approximating the correct focus is also one of the reasons that lenses of short focus are generally employed on hand-cameras, for in other respects they are not by any means to be recommended. By embracing such wide angles they give distorted views, and they so materially diminish the size of objects situated a very short distance away that this feature alone would be enough to condemn them if they did not possess some element deemed of paramount importance. For instance, with a lens of 3-inch focus all objects are in focus beyond $8\frac{1}{2}$ yards, but with a lens of double that length, or, say, 6-inch focus, all objects have to be beyond 30 yards distant before the same advantage is secured.

With regard to this point the following tables may be useful. They are not calculated accurately to inches, but to convenient fractions of a yard, and are therefore sufficiently correct to act as a guide in selecting a lens with suitable focal length for individual requirements. They are compiled from "The Tables of Conjugate Foci," made by Mr. J. R. Gotz, a little pamphlet all photographers should possess.

Focal length of lens.	Distance in yards beyond which all objects are in focus.	Size of a man on the plate, 5ft. 9ins. in height, standing at the specified distance.	Size on plate of a head at the same distance.	By racking out the lens $\frac{1}{16}$ of an inch all objects become in focus between the following limits.	Size of man standing midway between the distances specified in the previous column.	Size of head in the same position.	By racking out the lens $\frac{1}{16}$ of an inch objects come into focus between the under-mentioned distances.	Size of man.
3 ins.	$8\frac{1}{2}$ yds.	$\frac{1}{16}$ of an in.	Approx. $\frac{1}{8}$	Yds. $3\frac{1}{2}$ to $6\frac{1}{2}$	Ins. $1\frac{1}{8}$	$\frac{1}{16}$	$1\frac{1}{2}$ to $2\frac{1}{2}$	Ins. $2\frac{1}{2}$
$3\frac{1}{2}$ "	$11\frac{1}{2}$ "	$\frac{1}{8}$ "	$\frac{1}{10}$	4 to $9\frac{1}{2}$	$1\frac{1}{2}$	$\frac{1}{8}$ apx.	$2\frac{1}{2}$ to 3	$2\frac{1}{8}$

It will readily be seen at a glance by the foregoing tables that a man standing at a distance at which all objects commence to be in focus when a 3-inch lens is employed is $\frac{1}{16}$ of an inch upon the plate, while with a 7-inch lens he is only $\frac{1}{16}$ of an inch; but then with the former lens he need only be $8\frac{1}{2}$ yards away to be sharp at fixed focus as compared with nearly 47 yards in the one of longer range. If, however, the 7-inch focus lens be racked out to $7\frac{5}{16}$ inches from the plate, an object at a distance of $8\frac{1}{2}$ yards is brought into focus, and a man would be $1\frac{1}{2}$ inches in size upon the plate, which is nearly double that of the smaller lens. The distance, however, would have to be accurately gauged, and the focal length increased three-sixteenths of an inch exactly if the long-focus lens were used, whereas no such measurement is required with the 3-inch focus lens, for at the distance the man is standing, namely, $8\frac{1}{2}$ yards away, all objects are sharp when the lens is working at its fixed focus.

Mr. F. D. Bulmer.

We give in the following columns extracts from selected letters, which will give some idea of the extensive business conducted by Mr. Bulmer, and the system upon which he trades. It appears that he has been in business since 1886, and that as early as that date he pleaded the defence of infancy in all actions brought against him. We trust that the experiences hereafter set out, both by dealers and purchasers, will serve as a warning to our subscribers, at least, to give Mr. Bulmer a wide berth in future.

MR. ROBERT ABRAHAM.—It has been brought to my notice that a person named Bulmer, of Dewsbury, about whom there has of late been a correspondence in the *AMATEUR PHOTOGRAPHER*, is offering my specialities at a larger discount than I myself supply them. I may say that I have never knowingly supplied him with any goods whatever, and should most certainly not even allow him my usual trade and shippers' terms.

THE BRITANNIA WORKS CO.—We are glad to see that the *AMATEUR PHOTOGRAPHER* is brave enough to expose Mr. Bulmer's character, although we have been fortunate enough to have avoided any transactions with him, being forewarned as to what we might expect if we had done so. We have written him from the first that we shall be glad to execute any orders he may send us, *for cash*, and, of course, this never comes, and yet he sends us periodically a request couched in some apparently ingenuous form.

MESSRS. JOHN DONE AND CO.—We have done business with Mr. Bulmer, but having failed to get our money we threatened proceedings, to which he replied that he should plead infancy, and on our issuing execution summons, pleaded no effects.

MR. JONATHAN FALLOWFIELD.—When Bulmer ordered a Facile (and asked quotation for twelve), and gave me the address, Francis C. Pattison, 6, Montford Place, Kennington Green, I did not acknowledge or reply to his order, and when Pattison applied later on I replied saying my terms were "cash with order," and you will see the latter regularly makes use of your columns to offer all sorts of photographic goods. The system ought to be exposed, and you have it in your power to stop it, so far as the *AMATEUR PHOTOGRAPHER* is concerned, at any rate.

MESSRS. LANCASTER AND SON.—We are so glad the *AMATEUR PHOTOGRAPHER* has taken a firm stand and intend exposing Bulmer. We wish you would continue in your good work of annihilating trade parasites.

MESSRS. E. AND T. UNDERWOOD.—We notice in this week's *AMATEUR PHOTOGRAPHER* that you are going to make a report respecting F. D. Bulmer, and we herewith give you our experience of him. In 1886 we supplied him with goods, part of which he paid for, and the remainder of the account (about £8) we placed in our solicitors' hands for collection. They sued him, and ascertained that he was a minor, and nothing could be done. In April, 1888, a gentleman in London wrote to us saying he had ordered one of our cameras through him (Bulmer), and wanted to know the cause of the delay, as he had paid the money for it two months previously. We at once explained matters to our correspondent, and wrote to Bulmer, threatening to expose him. However, he sent the money back again, and promised to pay us. This he has not done, and the matter got overlooked. We communicated with the police respecting him in 1888, and they reported him as a minor, and regarded him as a *dangerous swindler*, from the number of complaints they had received respecting him. We always refuse to supply this class of trader, as there is usually some swindling in their offering such large discounts, and we warn people in a paragraph in our catalogue respecting them.

MESSRS. TAYLOR, TAYLOR, AND HOBSON.—We thank you very much for sending us Mr. Bulmer's estimate, which is the first we have seen of the kind. We beg to say that the lens referred to cannot be obtained from us at the terms named, that Mr. Bulmer has no business credit with us, and that we have already declined to do business with him. We shall be glad if you will inform your customers of this matter.

A LEADING LENS MAKER.—Some twelve months ago our attention was called to announcements by the person referred to, offering to retail our lenses at a reduction on our catalogue prices equal to the discount we would have allowed him as a

trader. An advertisement of this kind tells its own tale, and we could adopt no other course than to refuse to have dealings of any kind with him. Other manufacturers cannot fail to look upon such trading in the same light that we do, so that we anticipate it must soon die a natural death.

T. CRISP, JUN.—I am one of Mr. Bulmer's victims. I sent to him on December 1st, 1888, for Lancaster's photo materials, as follows:—Best leather case, 17s.; Lancaster's new stand, 10s. 6d.; case for stand, 3s.; compound focusser, 2s. 6d.; ebonite tweezers, 1s.; three quarter-plate metal slides, 7s. 6d. After writing to him a great number of times I received a camera case and tweezers, for which I had to pay 1s. carriage. Then after waiting about one month I received a stand for camera, for which I had to pay another shilling. Then about another month I received the three dark slides, the articles received being rubbish, not Lancaster's goods at all. The compound focusser and case for stand I have not received yet. I hope that you will be able to stop him from swindling anyone else.

MR. H. DAN.—Finding that you are about to publish information respecting F. D. Bulmer, I thought perhaps my experience of his dealings might add somewhat to the information you have already received. I advertised in your paper for a quarter-plate Lancaster's set, and among the replies I had one from this gentleman. Not being suited elsewhere, I wrote to him for estimate of better apparatus, and eventually ordered a Lancaster's quarter-plate set, at price quoted, and sent P. O. value 35s., about April 23rd, which was duly acknowledged, and saying that they hoped to be able to send it off that week. But no camera arrived. I then wrote asking cause of delay, and received post-card saying it was their agent's fault, and they would write and hurry them on. About another week elapsed, and I wrote them saying that if I did not receive camera at once I should cancel order. I received their reply, and again waited till the 8th, when I wrote them to return the cash at once, or I would proceed for recovery of same. They then had the impudence to send me P. O. O. value 35s., with no apology or explanation. I promptly acknowledged receipt on account, and said that it seemed that they were trying to obtain money by false pretences. They then sent me 1s. 6d. in stamps to balance, which I again acknowledged on account, and replied that as they had not forwarded me the full amount it more fully confirmed my idea respecting them. This last letter they have not replied to. They do not deny anything mentioned in my letters, but simply try to return less than the amount, thinking that one may not trouble about the balance.

MR. GEORGE LODGE—in response to an offer by Bulmer, on September 11th, 1888, to exchange a quarter-plate camera with lens for a half-plate camera—sent his camera to Bulmer, who, on October 3rd, wrote offering to allow £2 for it off a £6 half-plate camera, which offer Mr. Lodge accepted. The camera did not arrive, and late in December Mr. Lodge wrote asking for a Lancaster R.R. lens at £3. Bulmer sent one of his own (not a Lancaster's) at £2 10s. The balance of 10s. was paid, and then Bulmer tried, by repeated letters, to obtain 15s. more, saying the quarter-plate camera was only worth 25s.

MR. WATSON WORTH.—I am glad to see the warning in the *AMATEUR PHOTOGRAPHER* against the dishonourable dealings of Mr. F. D. Bulmer, of Dewsbury, as I have been also a victim. Last August I wished to buy a half-plate Lancaster Instantograph for a friend and pupil of mine, so I advertised in the *Exchange and Mart*, and in reply Mr. F. D. Bulmer offered to supply Lancaster's Instantograph for £3 10s., which I forwarded. Not receiving goods, I again wrote, and received in a few days one of his "Reliable Sets" (so called) with the enclosed note: "Our London agent informs us that it will be a week or so ere they can supply Lancaster's Instantograph. Thinking the delay would inconvenience you, I have sent one of my 'Reliable Sets,' which is only 6s. more than Lancaster's, and far superior." I immediately returned the same as not being according to order, and requested him to send Lancaster's, or return cash. He then promised to send camera on the following Wednesday, or cash. Not receiving either cash or goods, I wrote and cancelled the order, and requested immediate payment. He then replied, "Our accounts are only paid on 10th of the month." Cash not coming to hand, I communicated with a Dewsbury tradesman, also the police at Dewsbury, and found he was rather "shady," and not what he represented himself to be. I then demanded payment by return or I should take proceedings. I then received the money by instalments, less 2s. 6d., which he stated was for expenses incurred.

Now, after making a contract which he did not fulfil, and I paying carriage of goods not ordered, besides postage of several letters and telegrams, he charges 2s. 6d. for using my money several weeks without interest, besides putting me to the inconvenience.

MR. T. WATSON.—In April, 1888, I advertised in *Bazaar* for camera, which brought the first communication from Bulmer, dated April 27th. I did not reply to this till the following June, when I received a letter, dated June 26th, and sent forthwith P.O.O. for £4 for Marlow's half-plate camera. Having received no receipt for several days, I wrote at intervals, till I received post-card acknowledging P.O.O.; but as no further notice was taken, I wrote other letters, but failing to obtain any reply, I wrote the Chief Constable at Dewsbury, whose reply, dated August 3rd, I enclose. I then wrote Bulmer, telling him I had information to the effect that his calling was that of a swindler, etc., etc., and threatening legal proceedings. This had the desired effect. I got the camera, and afterwards a letter, demanding an apology for my accusation, etc., and stating he would have it if it cost £100. This and other letters I had from him I forwarded to the Chief Constable at Dewsbury, from whose letter you will see he has a good deal of information, which, no doubt, he would be glad to give you.

(Letter referred to.)

"This man is notorious to the police here. He makes a living by this very procedure. He has no shop, no place of business, and is still a minor. I have fifty letters similar to yours, but can get no one to undertake a prosecution. If you want to proceed, please apply to your police at Whitby for a warrant. You will observe he gives you no address but Dewsbury."

A SECRETARY of a prominent Society writes:—I observe a letter in your issue of the 16th ult., *re* the above-named. It is really quite time this *youth* were checked in his dealings. I had a small transaction with him some eighteen months ago, but could neither get my goods or money. Upon inquiry, I received the following letter from the Dewsbury police.

(Letter referred to.)

"In reply to your inquiry *re* the above-named person, I may say that he is well known to be a swindler in the photographic business. I have had innumerable inquiries from all parts of the kingdom and abroad, and he will, doubtless, continue his roguery until such time as his victims take action against him. I may add that he is a minor, under twenty-one years of age, and resides with his mother in a common dwelling-house."

A SECRETARY of another well-known Society, in his dealings with the above named, says he sent him a half-plate set in the early part of this year, which Bulmer offered to buy. The set, after some months, was recently returned, minus the stand, and with the name-plate removed from the camera and the name of F. D. Bulmer substituted.

A STUDENT of CHRIST COLLEGE, OXFORD, writes: My experience of Mr. Bulmer, of Dewsbury, is as follows: It is now three years since I dealt with him. His method of business was to advertise at a large discount. I wanted a half-plate wide-angle lens by Burr, so wrote to him. He wrote back saying he could let me have one for 55s., which he said was 5s. less than the real price of the lens; I did not find out for some time afterwards that the price of the lens was 50s. He also kept me waiting three months for a roll-holder which I ordered through him, inveigling me out of the sum of 13s.

AN AMATEUR FROM DEWSBURY writes: Having read the correspondence in your paper *re* F. D. Bulmer, and as none of your correspondents hail from this town, I therefore thought that I had better drop you a line regarding the said person, thinking that it would be acceptable to your readers. I may say that I should be very sorry to injure anyone, either in business or out, therefore I shall not say much, save that which ought to be known. I am assured he is not a member of the Dewsbury Photographic Society, nor has he ever been a member. His business tactics are pretty well known here, and on one occasion, if not more, if my memory serves me right, he has had to appear before the county court judge for obtaining goods and then refusing to pay for them. He then set up a plea of "infancy." Some of the dealers will know better than I do on that score. I called at his place some two years since, but found that he kept no stock,

save, perhaps, one camera, and that one, he said, was ordered. He has also advertised pretty frequently in the *Bazaar*, *Exchange* and *Mart*. Sometimes he would also advertise in his younger brother's name. The number of tricks he has performed are legion.

ANOTHER GENTLEMAN SAYS:—On May 6th, 1889, I sent an order to F. D. Bulmer for a quarter-plate camera set, *i.e.*, the "Paul Lange Camera," enclosing cheque for £13 7s. 8d. He replied, offering to send the pieces, not the camera fitted up, as I ordered by Messrs. Sharp and Hitchmough, at a greater reduction than as through that firm. This offer I refused, demanding the set as ordered in first instance. Letters were exchanged, and time went on, still I got no camera, nor would he return the money, and wanted to claim £2 10s. as expenses incurred. I had to take proceedings in the County Court, and he was ordered to refund the money, I think, at the rate of £1 per month. This is my experience of dealing with F. D. Bulmer. I had one or two appeals from some of his relations (I believe his wife and his father) begging me not to take proceedings, nevertheless they did not return my money.

ARTICLED CLERK TO A SOLICITOR:—Early in April I advertised in the AMATEUR PHOTOGRAPHER for a detective camera. I received an answer from Mr. Bulmer, of Dewsbury, offering me the camera I then wanted, "Rouch's Eureka," at 17½ per cent. discount. I had some communication with him, and he sent me advertisements of Swinden and Earp's camera, and on my asking its price offered it at £6 instead of £7, the London agent's price. In the same letter (which, unfortunately, I cannot lay my hands on at present, and which seems to be lost) he strongly advised my purchasing one of his own make, and saying that on my depositing the value of the two he would send them on a week's approval. I sent on or about the 21st of April the first halves of two £5 notes to him, and on getting their receipt, which promised immediate attention to my order, I sent the second halves. I named the next Thursday as the day on which I should like the cameras sent. Towards the end of April I went to the London agents for the Swinden and Earp's camera to ask them if they had ever received the order for it from Bulmer. They replied no. On the 1st of May I wrote Bulmer, telling him this, and asking him to explain it immediately. He replied on the 2nd, saying that he had ordered it from the makers, not the agents; also that he hoped to deliver the next week. I wrote again during the week, demanding it by the 12th of May. He answered saying he hoped to send it on the 12th. On the 16th I wrote again in reply to his letter of the 13th, in which he stated that he was writing to the makers to say that if they did not send him the camera by the Monday (19th), he should demand the return of his deposit with them. I wrote stating that as he had appointed the Monday as the limit of his patience, I fixed the next morning (Tuesday) as the limit of mine, and that if he did not send me a letter stating that he had received and forwarded on the cameras on the Monday, or returned my deposit of £10, I should put the matter in the hands of my solicitors. I attended the London agents of Messrs. Swinden and Earp on Monday, 19th May, and they read me a letter from Messrs. Swinden and Earp, in which they said Mr. Bulmer had applied for a camera, probably for me, about three weeks ago, and had sent money on deposit, which Messrs. S. and E. had appropriated in payment of an account owing from Mr. B. since Christmas last. On their applying for a further deposit before they would send the camera, Mr. B. sent half a £5 note and said he would send the other half on receipt of the camera. This Messrs. S. and C. refused, and retained the half note till their claim of a few shillings still owing from the old account had been satisfied. On the Monday morning I instructed my solicitors to write Mr. B. a letter, stating that unless the money or camera came to hand on the Tuesday, they had instructions to prosecute.

"In answer, Mrs. Bulmer, the mother, wrote promising that if camera did not arrive by next day she would send us a bank-note for £10, ending with the words, 'You may depend on this.' The next morning (20th May) we received from her a cheque for £10 7s. 1d. and a letter from her in which she said that the cheque was not to be cashed, but was to be retained by us until we received the camera simply as a matter of good faith. Of course, after her letter of the 20th May, we paid in the cheque, and to-day I hear it has been duly honoured. The firm has just written off to Mrs. Bulmer, informing her

what we have done, and enclosing a postal order for 7s. 1d., the balance on the cheque."

"GOLDSMITH POLISHER" writes:—You ask for correspondence and experience in respect to F. D. Bulmer. I once wrote for his estimate for three of Tylar's metal dark slides half-plate. I received no reply, and his advertisement read, "You can have it at one shilling per week delivered to address on receipt of first instalment." I sent postal order for one shilling. I received no reply. I sent another letter a few days after, and no notice taken, and I never received one of the letters back through the post. Being only a working man, I could not afford to lose time or money, so I let the thing drop.

"ANOTHER VICTIM" writes: In 1888 I had dealing with the above-named person. I advertised for a Ross lens 10 by 8. I sent him £7 5s. for the lens, which I was unable to get from him, and ultimately I received £7 from him, 5s. being deducted as expenses. I wrote demanding the 5s.; not receiving it, I placed the matter in the County Court, and got judgment against him, still he did not pay—his goods were then ordered to be seized for the amount. I then received a letter from the County Court saying, "in lodgings; no effects." From the foregoing particulars you will see he has been carrying on the same system your correspondent mentions for years.

"ONCE BIT" writes as follows:—Some twelve months ago I wrote to Mr. Bulmer for an article which he was advertising, enclosing stamps. Not hearing from him for more than a week, I wrote again, which brought forward a post-card, saying the article would be ready shortly. I waited about a month longer, then wrote again, and could not get an answer, nor have I to this day got the article which I paid for. The sooner such men are exposed the better.

BIRKENHEAD SOCIETY'S ANNUAL OUT-DOOR COMPETITION.

LAST Saturday the competitors in the Birkenhead Association's annual out-door competition were favoured with brilliant weather. Competitors were limited in operations to Bidston village and Hill, a quiet, rural, and picturesque spot three or four miles from Birkenhead. About fifty ladies and gentlemen attended the function, there being about thirty cameras "working," and nearly twenty candidates for the prize silver medal offered by the Society. Mrs. Webb was among the competitors. Mr. C. B. Reader, Honorary Secretary, had the arrangements in hand, discharging his duties with commendable courtesy and despatch. The rules of the competition were as under. Pictures, any size.

(1) All competing members must meet at Bidston Church gate at 3 p.m., and must then state to the Hon. Secretary their intention of competing, and the sizes they intend working.

(2) No competitor may carry more than six plates, and no more than six exposures may be made, and six results must be shown.

(3) No exposure may be made before the word is given, which will be at about 3.15 p.m.

(4) All the work, choice of subject, development, printing, toning, and mounting must be the sole work of the competitor.

(a) Any method of printing may be adopted. (b) A set need not be printed by the same method throughout. (c) No clouds may be printed in.

(5) The district to be limited to Bidston village and Hill.

(6) All work must be mounted and sent in to the Hon. Secretary, at 5, Cook Street, Liverpool, or "Mountside," Rowson Street, New Brighton, on or before the 10th June; must have no written or printed matter on the front, save title of picture, and only the usual distinguishing mark on the back.

Following the competitors about, it was noticeable that there was a consensus of opinion regarding the advisability and advantage of making the sets as varied and representative as possible. Hence, odd nooks, cattle, chicken and figure studies, farmyards, and foliage came in for much attention. Bidston Church was also extensively taken. The work occupied about three hours, and, from what could be learned, gave the operators general satisfaction. Among the competitors were Messrs. Tunstall, Stanistreet, Latimer, Wilkinson, Tomkinson, MacDonald, Bell, and other well-known good workers. Among the company were Messrs. Lange, Mayne, Sayce, Mackrell, Forrest, Kennedy, Brown, Watkin, the representative of the AMATEUR PHOTOGRAPHER, etc. The Liverpool, Birkenhead, Walton, and Wallasey Societies were represented.

Science Notes.

At the meeting of the Zoological Society on May 20th, Mr. Gambier Bolton exhibited a series of photographs, principally of animals living at the Society's Gardens and in Mr. Walter Rothschild's menagerie. Professor Flower exhibited a photograph of a nest of a hornbill, taken from a specimen in the Albany Museum, Grahamstown, South Africa, in which the female is shown "walled-in." It seems that a hole in a tree is selected in which the eggs are laid. The female bird then takes her seat upon them, and the male fills up the opening of the hole with clay; leaving just room enough for him to give a daily supply of food to the female, which he never omits to do.

Photographers who may wish to have a shot at Father Sol himself, will have a good opportunity on June 21st, at half-past nine in the morning, when about one-third of his disc will be obscured by the dark mass of the moon. The eclipse will be seen as an annular one in the north of Africa and in Asia; that is, the sun will there appear as a ring of light.

At the meeting of the Royal Microscopical Society on May 21st, Mr. J. Mayall, jun., referred to the donation by Mr. Andrew Pringle of a copy of his recently-published work on "Photomicrography." He said the volume embodied much practical information on the technical processes of photography, whilst the chapters devoted to the description of the various methods of adjusting the microscope and accessory apparatus required in the production of photo-micrographs bore everywhere traces of Mr. Nelson's co-operation, as frankly acknowledged by the author. It had struck him as somewhat strange that a work of this kind, addressed primarily to an American audience (for it was published by the Scovill and Adams Company, of New York), should contain so little reference to the employment of sunlight, the most powerful illumination at the disposal of the microscopist for photo-micrographic work, and which was so generally available in America. The use of the electric light was also dealt with very cursorily, though he was under the impression that great facilities were offered in America for its employment. The oxy-hydrogen light, however, was explained in considerable detail, and some excellent examples of photo-micrographs produced with it were given.

To slightly alter Dickens, we advise everyone who comes across any *lusus nature*—"When found, make a photograph of." Everybody connected with science is beginning to do this without our advice, though. Thus our dear friend across the sea—Dr. Wendell Holmes—writes in the June number of the *Atlantic*, "During the late session of the Medical Congress at Washington, my friend, Dr. Priestley, a distinguished London physician of the highest character and standing, showed me a photograph of a small boy, some three or four years old, who had a very respectable little tail, which would have passed muster on a pig, and would have made a frog or toad ashamed of himself." Wise Dr. Priestley! He knew that the photograph would be believed.

Film users must beware, when changing from one make of celluloid film to another, that they put the *right side* of the film to the front. Anthony's Climax films—a splendid make, of which we have used large numbers—are coated on the *matte* side. Now Carbutt's films are coated on the *polished* side of the celluloid. Hence the *uncoated* side of the Carbutt film is much like the *coated* side of Anthony's. Of course, the real difference is perceptible enough in good light; but in the obscure light of a strange dark-room we lately made the mistake of putting the uncoated side of some Carbutt films to the front. Notwithstanding this, the negatives are good, and halation is singularly absent. Perhaps as regards the latter point this plan might be a "wrinkle."

Another question—the present great difficulty with celluloid films is to find a varnish for them. In fact, there is no suitable varnish. Remedy: Expose *through* the film, and then print by placing the sensitised paper on the *uncoated* side of the negative. The celluloid is so thin, especially in the case of the rollable film, that there is no material loss of definition. Or, if there should be any slight loss, it might very probably be an improvement.

We are surprised not to have seen any allusion in print to the remarkable *colour* possessed by the thin "rollable" celluloid film of the Eastman Company. It reminds one of the sweetmeat sold as "pear-drops," and is therefore probably amyl acetate, which must be used in dissolving the tissue-paper out of which the celluloid is made.

F. G. S.

Photographic Exhibition at Drapers' Hall.

ANY one who was present at the opening ceremony on Friday evening last, at what may be justly called the Palace of the Drapers' Company, must pronounce the experiment of the photographic section of the London Chamber of Commerce a most complete success, for never before has any collection of photographs, and the apparatus for producing them, had such a princely home, and never before has there been such a brilliant inauguration. A crowd of some 800 to 900 well-dressed people responded to the invitation to be present at the opening soirée, and City dignitaries, with their chains of office around their necks, jostled the enthusiastic votaries of the black art; and, to judge by the names called out from the grand staircase, as new comers entered the drawing-room, titles were as plentiful as gooseberries in spring or blackberries in autumn. The fair sex were fully represented, and gay colours relieved the monotony of the regulation black. In one case the fair proportions of a beautiful arm were accentuated by an immense diamond, which formed the centre of an ornament for looping up the sleeve; and in an awe-inspired whisper one lady said to another, "Surely photography must be a very profitable business to make such things possible!"

The crowd was so great that it was impossible to see the pictures properly, and it was fortunate therefore that a band stationed in the gallery of the banqueting hall, provided an admirable programme of music, adding still further to the attractions of this gorgeous room, which has been devoted entirely to the exhibition of apparatus. In the library, after the opening ceremony, the Meister Glee Singers charmed all those fortunate enough to get into it with their perfect rendering of glees and part songs.

The Chairman of the Council of the London Chamber of Commerce, Sir Albert K. Rollit, must be complimented for his admirable opening address, which was as follows:—

"I must first express, on behalf of the Chamber of Commerce, our obligations to the Drapers' Company for allowing us to hold this Exhibition in this most suitable building. The Drapers' Company have done very much for the education of the people; they have taken a great interest in many public schools, they have expedited the work of the people in technical instruction in the metropolis, and now they have done much to aid a department of commerce. (Cheers.) I should next like to express our regret that many whom we had hoped would have been present are not here to-night. Those whom we have wished to see we must compare to the negatives of photography. I regret the absence of the Lord Mayor, who was to have opened the Exhibition; but, at any rate, we have Mr. Sheriff Knill, who thus represents the interest of the City of London in photography. (Cheers.) The results which we see to-night must have entailed much previous work and attention, and for this I am sure we must convey our hearty thanks. It is the desire of the Chamber of Commerce to do as much departmental work for the benefit of the City and the people generally as possible. The Chamber is continually starting new sections, the last one being the electrical section. It was felt by the Chamber that work would be best done in departments and by experts. We must congratulate the photographic section upon their work, for this is the first free photographic exhibition ever held—at any rate, in the City. You will, I think, concur in what I venture to express, that this is a great credit to the Chamber of Commerce, and that the Chamber is performing a great benefit to the City. The desire of the Chamber is to give publicity to these works of art, and to give an opportunity to the public of seeing them. The results of photography are undoubtedly great. If we look at the photographs which are being exhibited to-night, no one can fail to be struck with the excellence which is shown in them. In my opinion, they seem to excel all other exhibitions in one respect—I mean in the size. I think we may speak even of size in connection with photography as being an excellent point, as it indicates the gradual triumph over difficulties in the way of enlargement. We have also an opportunity of seeing a very great collection of scientific appliances in the highest perfection, both in their genius and in their workmanship. To my idea, many people neglect what I may call the education of shop windows. I recall the very best exhibition which I ever saw, the Scientific Loan Collection, at South Kensington, of 1876; and the advance made since then is remarkable. It is not about half a century

ago since photography became one of the practical arts, and yet since that time what marvellous advance has been made. It was that great genius, Wedgwood, who, in my opinion, seized some of those hints which were given by nature in relation to photography, and it is a satisfaction for us, as Englishmen, to think of that." Sir Albert then traced the various discoveries in the art down to the present time, when, as he declared, truth and beauty are allied in the art of photography. Continuing, Sir Albert said—"I hope it will be possible to seize and fix colour in relation to photography some day. In conclusion, depend upon it that the best way of advancing our art is by making it familiar to the minds of many. Photography has ministered to art; it has given us beauty, it has given us not only views, but artistic views, and it has exercised as well a great social influence. Should we have been in quite the same advanced stage of social progress if we had not had the ministering help of photography, which has given us the faces of our friends and aided us in every science?" (Loud applause.)

Mr. W. S. Bird then proposed a hearty vote of thanks to the Drapers' Company for the use of their hall, which was seconded by Mr. Watson, and carried by acclamation.

Mr. George Lawford (Past Master of the Company) replied briefly, regretting the absence of the Master of the Drapers' Company, and assuring the audience that it was their highest aim to help in all educational work in the City.

Mr. Alderman and Sheriff Knill expressed his pleasure at the Exhibition. He was quite sure that the Lord Mayor would have been delighted to have visited it, but as he had only just returned from Yorkshire, where he (Sir Henry Isaacs) had been recruiting his health, he had been unable to be present. He was glad, however, to say that his lordship was improved in health.

The formal proceedings then terminated, and the company dispersed, either to view the Exhibition, listen to the excellent musical programme, or partake of the refreshments provided in the courtyard.

On visiting the Exhibition by daylight the beautiful staircase was, if possible, more striking, and Edward III. and his Queen Philippa looked down from their niches on deft-fingered damsels who were busily engaged in fitting a new carpet. There was a striking fitness about this, for they introduced weaving into England: hence their honoured place in the home of the Drapers, and their stony gaze seemed to express approval, as much as to say, "Do all things well, even to the entertainment of photographers."

The first room entered is the drawing-room, and the pictures are well arranged on screens built out from the pilasters and forming a series of well-lit bays. Most of the well-known firms have taken entire screens, so that their work is, as is usually the case at exhibitions, not scattered. Naturally each one sends his best, and the collection as a whole is thoroughly representative of professional portrait photography in 1890. Most of the pictures are so well known, however, to all photographers, that very few call for special mention in these pages.

While portrait photography is thoroughly represented, one is struck, in walking through the rooms devoted to pictures, with the very small number of landscapes to be found in the exhibition. Of course, this is not to be wondered at when it is remembered that the works of amateurs are entirely absent; but it gives a monotony to the collection as a whole. There is one striking exception, however. Mr. Payne Jennings has sent an admirable series of landscapes printed in platinum, well selected and framed with extremely good taste. Indeed, this set of pictures should be well studied by amateurs, for there is much to be learned. "A Norfolk Barge on the Yare" is a tall, striking picture, and separates two frames of landscapes, one devoted to the Norfolk broads, and the other to scenes in Devonshire. Among the south country scenes there is a very taking picture of a little tidal harbour. The tide is out, and the wave-wrinkled sand supports a dark-hulled smack in the foreground. The little haven is part of a bay, for there are hills in the distance. There is a flood of light out at sea, and it streams down on the wet sand in the foreground, and the rough old jetty makes an admirable foil, giving force and contrast to the whole. In the Norfolk series there is a delicious little picture made out of very slender materials. A little haven, made this time of rushes and water weeds, but giving protection to a brood of wild ducks who evidently can distinguish between a camera and a gun, fo-

they appear quite unconcerned. In another picture it is only a rudely constructed house-boat occupied probably by one of the natives whose occupation is eel catching. An evening meal is possibly on the way, for the boat stands out in strong relief against a background of vaporous smoke, and trees are seen here and there shimmering through it.

On another screen there are examples of the Kallitype process. The prints are from the negatives of several well-known photographers, and their colour is of a fine engraving black. The centre one is by Whitlock, of Birmingham, and is a costume picture. A lady, white-wigged and bepatched, is gracefully lounging, and is gracefully playing with a fan. This is an admirable picture. A series of expression studies of Herkomer, as Fillipo in his poetic play, recently given at Bushey, are sent by Mr. Downer. These must attract attention, for some of them are very fine. Another picture by the same hand shows the fiddle maker in his home. The scene has been carefully built up, and is very complete, but it is another illustration showing how unreal all theatrical scenes look when taken by artificial light. The cross shadows behind the fiddle-maker make an ornamental B. Slingsby's group of at least a hundred children at a ball shows the utility of magnesium for special purposes. Another, of the Solar Club at dinner, will be interesting to a great many photographers, for a large number of well-known men will be easily recognised.

Window and Grove's screen is well arranged, as is also that of Elliott and Fry, and Downey. On the latter there is a very fine portrait of Professor Huxley. It is of large size, and is simple in treatment and admirable in pose. A lady in Court dress, on the same screen, is very fine in light and shade, but is it an ostrich fan or a fleecy white poodle that she is wheeling in the perambulator, or rather chair, for on closer examination it turns out to be the latter?

The Autotype Company make a very fine show of their various well-known productions. Autogravure and collotype are well represented, as well as the carbon process. A portion of the friese of the Parthenon, produced in bistre colour, is very fine indeed.

Vanderweyde shows two of the pictures from his triptych of the "Adoration of a Doll," and an admirable group, after Sir Joshua Reynolds. The picture is of large size, and contains the portraits of three ladies of distinction. An amusing incident was witnessed by the writer. Just before the guests assembled at the soirée, and while the finishing touches were being put to the show, a little boy rushed up, breathless, with three labels, bearing the names and titles of the ladies in question; on being asked how to place them, he said, the centre one was Lady —, but that he was not quite sure about the others. Mr. Vanderweyde had said the youngest and prettiest was Mrs. or Miss —. Here came a difficulty, for all were fair. A happy inspiration came to one of the party, and he said to boy, can you toss? The reply was, "Rather." A halfpenny went into the air and decided the difficulty. Here we had the choice of Paris, with a difference. Poor Paris! Why did he not adopt this plan, and spare himself the risk of having his eyes scratched out by Mesdames Juno and Minerva, for deciding in favour of Venus? The ladies in Vanderweyde's picture must feel the compliment if they should ever hear of the incident, for surely a great compliment was implied in the mode of decision.

The corridor is well lighted, and contains some very fine pictures, many of them well known, as, for instance, the large portrait of Stanley, by J. Thompson. There is very little touching upon it, and it is a grand picture. The smaller portraits are very perfect by the same hand, notably a girl in soft white dress, looking down at a picture-book. Friese Greene shows two very fine cloud studies, and there is a fine, upright picture of a yacht, by Morgan and Kidd. The shadows on the lazy, oily-looking ripples help to make a simple subject into a very effective one. Doulton shows a series of Tinworth's reliefs, by T. W. Edwards, and they show unusually well in this well-lighted gallery. The same may be said of the two very fine portraits of George Macdonald and Professor Blackie. Mr. Flather has sent some examples of what he calls dry point effects. In one there is a girl in costume, with tambourine. By his peculiar method a sketchy broken background has been worked in, and in consequence it is difficult to believe at first sight that it is not a copy of a picture instead of a portrait from life.

There is a splendid show of apparatus in the banquetting hall, and nearly all the best firms are represented, but we did not see anything to call for special notice. At the curved end of the

room Messrs. Marion and Co. make an immense display of their various specialities, and in the centre of the hall Watson's show of cameras and apparatus cannot fail to be seen.

In the corner of one of the rooms there is a splendid electrical lantern for photo-micrography made by Newton for the Santa Clara College, and in the square room, devoted also to apparatus, Mr. W. England shows an ingenious method for exhibiting examples of celuloid films. They are slipped into the openings of an album made for the purpose, and by holding the page at the proper angle the reflection from a blank page gives the light necessary to judge of the quality of the negatives.

As we have said before, most of the work shown—both apparatus and pictures—is well known, but never before has there been such a completeness about the general effect. The Drapers' Company have earned the thanks of photographers for their liberality, and the committee of the Photographic Section of the Chamber of Commerce, with Mr. W. Bird at their head as Chairman, may be congratulated on the success that must crown their efforts.

Notes from the Liverpool Centre.

(By our District Editor.)

ON Wednesday, last week, Mr. Paul Lange gave a practical demonstration in the Liverpool head-quarters on "Platinotype Printing," devoting special attention to the hot bath. There was an excellent attendance, and the demonstrator was closely and rather critically followed. Mr. Lange had two or three prints under printed, over printed, and correctly printed. These were put through, and afterwards a useful discussion took place. Several gentlemen contributed to the evening's work. Mr. J. L. Mackrell exhibited platinotype prints, copies of successful pictures and engravings, before spoken of for their softness of tone and general brilliancy. Silver prints also entered into the proceedings.

It has been arranged that members who wish to be present at the excursion to Rosset and Gresford, North Wales, on Saturday, 6th inst., shall go for whole or half day as convenient. The first train leaves Woodside station, Birkenhead, at 10.35 a.m., the last at 1.55 p.m. Mr. W. Tomkinson and Mr. Mackrell are the leaders for the day.

It will give many photographers very sincere pleasure to hear that Mr. Paul Lange has been approached to take 200 studies in Iceland, on the same lines as those of Norway, which have made the gifted President of the Liverpool Association more than known in the photographic world. The trip, which commences this month, will extend over three weeks, the British Yachting Company's fine little vessel, *Myrtle*, taking the party out, sailing from Liverpool for Reykjavik. Excursions will then be made to Thingvalla, the Geysers, Hecla, Krisuvik, and other places in the interior. Mr. Lange, "under canvas," both at sea and on shore, and with four Iceland ponies to pull him and his apparatus about, would be excellent studies in themselves. It is felt here that the commission is "another feather in Mr. Lange's cap," and a better man for the expedition could not be found.

The Birkenhead Society's Outdoor Competition last Saturday was satisfactory in the extreme. The actual number of competitors was twenty-two. Messrs. G. E. Thompson and R. Hartley, both connoisseurs in the art, are the judges.

An instructive evening is looked for at the Walton Society this week, when the Hand Camera Exhibition, promoted by the members, takes place. Messrs. Burn, Latimer, and Sharrock are exhibiting cameras of their own invention. These will be explained, and specimens of their work shown.

The ordinary meeting of the Liverpool Association held last Thursday, as detailed in the REPORTER, attracted a large gathering.

GROUND-GLASS FOR FOCUSING SCREENS.—Too often makers of cameras do not pay sufficient attention to the quality of the glass used for focussing screens. Messrs. S. and G. De Saules and Co., of Birmingham, have sent us a sample of their finely ground glass, and which they can supply at prices considerably under those charged for inferior glass. The sample before us has the very perfection of a surface for focussing upon. We unhesitatingly recommend camera makers to pay more attention to the quality of glass, and for this purpose advise them to give Messrs. De Saules a trial.

Holiday Resorts and Photographic Haunts.

ST. MARGARET'S BAY AS A HOLIDAY RESORT.

BY PERCY A. E. RICHARDS, F.C.S.

ST. MARGARET'S BAY is situated very nearly midway between Dover and Deal, and is about eighty miles distant from London. Martin Mill, the nearest railway station, can be reached by train from Victoria in three hours, and an omnibus plies between railway and bay at a sixpenny fare. The village of St. Margaret-at-Cliffe, as it is called, lies on a hill about half a mile from the bay, on the Martin Mill road, and forms a very pretty picture on approaching it from the sea, its old church of Norman architecture standing conspicuously in its midst. In both bay and village, visitors can procure accommodation; the former possessing the "Granville Arms," and the latter the "Cliffe Hotel" with a good boarding-house attached. Boating and bathing can be obtained in the bay, and sea trips may be made in sailing-boats to Dover and Deal, and also to the light-ship at the South end of the Goodwin Sands. The bay itself is deserving of several photographs, the view from the East Cliff being, perhaps, the best. The village also is worth "taking" from various points of view besides the one already mentioned. One might recommend the view from the top of the hill on the Martin Mill Road, and that from the northern end of the village street. The best view of the church is from the field on the west side.

The great attraction of St. Margaret's is that besides possessing the advantages of a quiet seaside village, country walks can be taken in nearly every direction round it, most of them full of interest to the amateur photographer. The following are perhaps a few of the best:

Leaving the village by the Martin Mill Road, turn to the left on reaching the cottages at the foot of the hill and cross the fields by the footpath until you reach the high road running from Dover to Deal. Cross this, and, turning into the lane running at right angles to it, you will at length reach the village of East Langdon. This possesses, in addition to a quaint old church, many pretty bits worth photographing. From this village a very pretty path takes you across fields and by trees to Martin, in which several good views may be taken. Thence the return journey can be made, passing Martin Mill on the right hand, through fields to Oxney Bottom and thence to St. Margaret's by road (four miles).

Another walk might be made in the direction of Kingsdown, starting by the road leading past the "Red Lion" and crossing the fields at the bottom of the slope, until you reach the coast-guard station. Then entering the village along the seashore and climbing the cliffs by the road to Ringwold you will pass the church, sheltered by trees, lying to the right of the road. The return may be made through the fields to the left and then along the top of the cliffs past Earl Granville's shooting lodge; or, if preferred and tide will permit, along the sea-shore. (Distance six miles.)

An interesting walk may be made to Walmer by taking to the fields at the stile on the left hand after passing the "Red Lion," and following the footpath past the Granville Farm until you reach the high road to Deal. This takes you past Ringwold, a very picturesque village, direct to Walmer. The return may be made by rail from Walmer or Deal station, or on foot, along the sands to Kingsdown, and thence to St. Margaret's. (Distance one way, four and a half miles.)

In walking over to Dover I would recommend going by the road running through West Cliffe village, until the Deal to Dover road is reached, and then following the latter to Dover past the Castle and down the hill. In returning, follow the path which leads you through a tunnel up to the top of the cliffs, where another path will take you along their summit past the Cornhill Coastguard Station and the South Foreland lighthouses to St. Margaret's Bay. The view from the top of these cliffs on a fine clear day is splendid, the coast of France being distinctly visible, and the sea between covered with ships of every kind.

NORTH MIDDLESEX PHOTOGRAPHIC CLUB.—On Monday next, June 9th, Mr. G. J. Clarke will give a lecture on "Photographic Optics."

Register of Dark-Rooms, 1890.

THE following "Dark-Rooms" have been placed at our disposal.

We class them in four divisions, *i.e.*, *a* amateur, *d* dealer or professional, *h* hotel, and *s* photographic society.

In our letter of introduction full particulars are given as to owner, address, charges (if any); plates, chemicals, etc., kept by dealers; terms for temporary membership of societies; hotels; distance from station, etc., etc.

Every application for letter of introduction must be accompanied by SIX PENNY STAMPS. The owner of "Dark-Room" will be advised by same post as the applicant. The envelopes should bear the endorsement DARK-ROOMS.

Societies' Meetings.

NOTE.—In this column the Editor can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editor will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BELFAST Y.M.C.A. CAMERA CLUB.—The usual monthly meeting was held in the Lecture Hall on the 28th ult. The chair was occupied by Mr. Hamilton M'Cleery. The Chairman directed the members' attention to the Enlargements kindly lent by the AMATEUR PHOTOGRAPHER, which were tastefully arranged round the walls. After spending considerable time inspecting the enlargements, the meeting turned its attention to arranging a proper code of rules to regulate the monthly competition, and an extension of time was given for the present month. Votes of thanks closed the meeting.

BRIXTON AND CLAPHAM CAMERA CLUB.—On the 30th ult an informal meeting was held, being mainly devoted to discussing arrangements for preparing slides for exchange with the Toronto Amateur Photographic Association. Prints from negatives taken on recent excursions were shown, and samples of Powell's compressed developoids were distributed. These were thought to be well adapted to the needs of the tourist who wanted a portable developer.

DUNKINFIELD PHOT. SOC.—The following officers have been elected for the ensuing year: President, W. H. Shirley; Vice-Presidents, J. W. Hadfield, T. Glazebrook, W. Greenwood; Committee, S. T. Ainsworth, W. Chadwick, Dr. Hamilton, B. Hall, W. Jenkinson, J. Leech; Hon. Treasurer, J. Winterbottom; Hon. Secretary, T. Borse. The ordinary monthly meeting was held on the 27th May, the President in the chair. The President in his address referred to the desirability of the members' regular attendance at the society's meetings, and gave several timely hints with reference to the avoidance of certain common mistakes when in the field. A very successful demonstration on the hot platinotype process was given by Dr. Hamilton. Mr. W. Jenkinson presented to the society a capital photograph of the President mounted on opaline, and was awarded a hearty vote of thanks for his present.

ENFIELD CAMERA CLUB.—A meeting to consider the desirability of forming a camera club for Enfield and district was held on the 29th ult. Mr. James Dudin was voted to the chair. In the course of conversation it was mentioned that there was no photographic association in the more northern of the suburbs nearer than Stoke Newington and Hornsey Road, and the opinion was expressed that there were a sufficient number of amateur and other photographers in the locality to form a strong and useful society. A number of letters from those willing to join such a club if one were formed were read, and some discussion as to its objects and the extent of its operations took place. Eventually it was resolved to form a society to be called the Enfield Camera Club. It was agreed to admit ladies and professional photographers to membership. Mr. D. G. Pinkney was asked to accept the Presidency, and Mr. J. Dudin the post of Hon. Secretary *pro tem*.

HOLBORN CAMERA CLUB.—An ordinary meeting was held on the 30th ult. Mr. E. Dunmore was elected an honorary member, and Mr. G. A. S. Robinson was proposed as a member. The following questions were then read from the question box:—The sensitometer number of the Phoenix plates? This the Secretary promised to find out from the makers.—A good hydroquinone developer? The Ilford formula, which is as follows, was strongly recommended:—Hydroquinone, 160 grs.; sodium sulphite, 2 ozs.; bromide potassium, 30 grs.; water, to 20 ozs. Sodium hydrate, 100 grs.; water, 20 ozs.; and using equal parts of each.—The best way of keeping hydroquinone in solution or crystals? Decidedly in deep blue or yellow glass bottles.—A remedy for green fog? Soak in solution of bichromate potash, and thorough washing afterwards in water.

LEITH AM. PHOT. ASSO.—The usual monthly meeting was held on the 27th ult., Mr. T. W. Dewar presiding. Mr. John Pourie read a paper entitled "Practical Hints on Little Matters," in which he treated of mounting, spotting, etc. A discussion followed the reading of the paper. The Secretary exhibited and explained various novelties, including a special rectilinear lens

CORRECTION.—Mr. H. H. Williams writes:—"Will you kindly correct an error in the 'Liverpool Notes' in your issue of the 23rd ult.? I certainly did not say the toning bath should be acid, but slightly alkaline. A little bicarbonate of soda, I said, was useful to rub on the red spots that sometimes appear while toning."

MESSRS. PERCY LUND AND CO., Bradford, have sent us specimens of their photographers' stationery, price lists, cards, material for background, etc., and prove that they are able to supply all requirements; they also send a bottle of "water-resisting varnish." The chief object of this varnish, or substratum, as the makers are pleased to call it, is to act as a first coating, afterwards to be supplemented by a hard-drying negative varnish. It is claimed that by its use the film will be made impermeable to water, entirely resist the action of damp, and prevent stains from silver printing.

for detective cameras, the Acme photographic dish, Samuel's patent hand-camera, Wormald's lantern masks, etc.

SHEFFIELD CAMERA CLUB.—The usual monthly meeting was held on Wednesday, May 28th, when Dr. Merton read a paper entitled "Negatives," dealing with the subject from the manufacture and different stages down to the finished negative. The lecture proved to be both interesting and instructive. After describing the difference between the positive and the negative, the lecturer dwelt upon the troubles owing to defective coating, packing, etc., the action produced by developers, illustrating his remarks by a considerable number of negatives.

PHOTOGRAPHERS' BENEVOLENT ASSOCIATION: AN APPEAL.—The Chairman of Committee asks us to insert the following: At the annual meeting the functions of the Association were so largely extended, by enabling the Committee to deal with any well-authenticated cases of distress brought to their notice, that we are anticipating a considerable increase in the number of calls

on our limited funds. In fact, the grants already made this year largely exceed the average. Under the new rules contributions of former subscribers to the funds to the extent of £250 have been set aside as a nucleus around which to form an annuity fund, and this sum cannot be drawn upon for the purpose of granting temporary relief. I wish to impress on your readers the fact that this is the only charity which exists with the object of assisting persons connected with photography who are in necessitous circumstances arising from misfortune; and many who have been reduced to this necessity, including more than one name once distinguished in the profession, could testify with gratitude to welcome aid received from the P. B. A. in the time of need. The minimum subscription has been fixed at 2s. 6d., and I appeal to the benevolence of your readers to induce them, if I can, to subscribe to the funds according to their ability, with the confident assurance that the Committee will deal with any money entrusted to them with discretion and economy. Subscriptions and donations will be thankfully acknowledged, and a copy of the rules forwarded by the Hon. Secretary, Mr. H. J. Beasley, 65 and 66, Chancery Lane, W.C.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

QUERIES.

3839. **Lizard.**—Is there a dark-room at the Lizard where changing plates and developing can be done, and if not where is the nearest place where there is a dark-room.—F. A. R.

3870. **Toning Bath.**—Will any reader kindly inform me as to quantities of a toning bath, which contains following: Solution of gold, tungsate of soda, water?—LEO.

3871. **Weymouth.**—Can any reader inform me as to any "choice bits" round about or in Weymouth?—LEO.

3872. **Shutter.**—What rate does the Thornton-Pickard shutter work at, the fastest and slowest instantaneous, and are Ilford rapid plates, white label, quick enough for the quickest exposures, such as a cricket match?—B. J.

3873. **Glass.**—What is meant by squeegeeing on talced glass to give a polished surface?—B. J.

3874. **Yorkshire.**—I intend to spend about ten days in Yorkshire, visiting Ripon, Helmsley, and Leyburn. Would any of your readers kindly tell me the best points of interest round about the above places, and what permissions are required? as I understand there are several ruined abbeys and castles. Also which are the best places to put up at? and whether there are any dark-rooms in each of the above-named places. As I have not much time to spare, before I go, and as the answer might take up a deal of space in your paper, I shall be much obliged if any one will answer me direct.—JAMES SHAW, 5 and 7, Great Ancoats Street, Manchester.

3875. **Hastings.**—Can any reader kindly inform me of a dark-room, that I might use on payment or otherwise, at Hastings, as near the pier as possible? I should only require it for changing plates, at various times between June 23rd and July 7th.—PELICAN.

3876. **Lowestoft.**—Will someone kindly tell me

where I can obtain Ilford red label plates at Lowestoft.—PLATO.

3877. **Toning Bath.**—I find that after using my toning bath once, the gold is precipitated in the form of a black powder. Can anyone give the reason of this, and also the remedy? The solution I use is made up as follows:—

Chloride of gold	...	...	...	1 gr.
Acetate of soda	...	...	...	30 grs.
Water	...	...	...	8 ozs.

C. H. T.

3878. **Eclipse of the Sun.**—Would some reader kindly give me full particulars for photographing eclipse of the sun this month. My camera is Lancaster's half-plate 1888 Instantograph. Is it possible to take it without a telescope, as the only one I have is about 18 inches long. Any details about exposure and plate will be thankfully received by MAX BELLORS.

3879. **Enlarging and Enlargements.**—Can any brother amateur tell me, firstly, if it would be possible to enlarge by daylight with Lancaster's half-plate Instantograph and lens, as sent out. How far should the lens be away from the paper, to enlarge to 15 by 12? Secondly, could I enlarge on ordinary sensitised paper, what toning bath should be used, and about how long should I expose. Thirdly, should I have to make a hole in the double dark slide or not? Fourthly, could I use the Alpha paper developer for bromide paper.—MCCC.

3880. **Quickest Dry Plates.**—Which are the best and quickest dry plates for instantaneous shutter work? Have tried Ilford special rapid, and Thomas's T.C. extra rapid. Will any reader give me their opinion?—BLUE RIBBON.

3881. **Isochromatic Plates.**—I have seen Edwards' Isochromatic plates advertised, but no price is named; what are the prices, and how are they for speed?—BLUE RIBBON.

3882. **Residues.**—How can I get the silver from trimmings of untuned silver prints, and should I be able to get the silver from paper blackened by exposure?—TYRO.

3883. **Photo-Micrography. Plates and Light.**—I should be obliged if you would kindly inform me what are the best plates to use for photographing rock and botanical sections, also the best light to use. I have been using Ilford slow and American celluloid plates for some time, but fail to get satisfactory definition. The light I usually employ is a paraffin lamp with a circular wick, a little camphor thrown into the oil, and the exposure about 35 minutes. Some of the negatives are tolerable, but none show the sharpness of detail I would wish.—PHOTO-MICROGRAPHY.

3884. **Brittany.**—I should be glad of information on the following points. I propose to do a tour through Brittany this summer with a hand-camera, on a safety. I wish to know (1) if I shall have to pay any import duty on either machine or camera, or (2) whether I must apply to anybody high in authority for leave to take photographs? (3) Could you give me any hints as to any particularly pretty spots worth a visit? I have already spent six months there, and have visited among other places Morlaix, Guimileau, Le Favu, Chateaulin, Landevenec, Hauvee, Rumengol, Huelgoat, St. Michael (mountain). I should like to revisit some of these places again, and if your readers know of any particularly charming places I should be glad to hear of same.—JOHN TERRELL.

QUERIES UNANSWERED.

Mar. 7th.—Nos. 3528, 3551, 3554, 3556.

21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3612, 3614.

28th.—Nos. 3634, 3636, 3640, 3643, 3653.

April 4th.—Nos. 3661, 3664, 3674, 3677.

11th.—No. 3694.

18th.—Nos. 3708, 3718.

25th.—Nos. 3727, 3731, 3735, 3736, 3742, 3744, 3747.

May 2nd.—Nos. 3758, 3767.

9th.—Nos. 3793, 3795.

16th.—Nos. 3805, 3808, 3814, 3820, 3822, 3823, 3824, 3826.

23rd.—Nos. 3827, 3828, 3829, 3834, 3839, 3840, 3841, 3842, 3843, 3845.

30th.—Nos. 3852, 3854, 3857, 3858, 3860, 3862, 3865, 3866.

ANSWERS.

3810. **Collotype.**—"G. H." should communicate with Mr. Petskey, 174, Ramsey Road, Forest Gate, London, E., for practical lessons.—ETCHER.

3832. **Purple Tones.**—"Egham" can get the finest tones purple if he uses a bath composed of

Chloride of lime	...	...	...	14 grs.
Acetate soda	...	...	...	1 oz.
Chloride gold	...	...	...	1 tube
Water (hot)	...	...	...	80 ozs.

To be mixed dry before using.—RELIANCE.
3832. **Purple Tones.**—Re answer in May 30th, read 15 drachms instead of minims, *id est*

Gold	...	...	...	15 grs.
Water	...	...	...	15 drms.

(1 dram equal 1 grain.)

—PETER PIPER.

3846. **Set, Information Wanted.**—If you do not wish to go to a high price, get a Lancaster's half-plate International, minus the lens, and fit it with an Optimus R. E. 7 by 5; avoid the "complete outfits" as advertised, but purchase your chemicals, etc., as required. Get "The Beginner's Guide to Photography" (Perken, Son, and Rayment) as an instruction book, and later on supplement it with the "Dictionary of Photography." If you will write me (address with Editor), I will send you a complete list of all that you will require to commence with, together with a few hints.—H. LEACH.

3847. **Plates.**—I found them as near as possible the same rapidity.—W. A. J. CROKE.

3847. **Plates.**—Ilford white label are forty times rapidity of wet plate, and Thomas's are sixty, so it is as forty is to sixty, or four to six.—B. J.

3847. **Plates.**—Ilford white label are about two-thirds the rapidity of Thomas's extra rapid.—H. LEACH.

3848. **Exposure.**—Presuming that the light is at its best, but that there are shadows in which detail is required, $\frac{1}{10}$ of a second would be correct for $f/10$ with Thomas's extra-rapid, or 1 second under the same circumstances with Thomas's slow landscape. This is the indication given by my exposure meter.—ALFRED WATKINS.

3848. **Exposure.**—From your query you give one the idea of being quite a beginner. Under the circumstances named I should say you would have to take off and put on the cap again as quickly as you can with your hand. But why use $f/10$? You will get no definition whatever, especially with Lancaster's Instantograph. Try $f/32$, and two exposures of 3 and 6 seconds. You should experiment; it is the only way to get on.—W. A. J. CROKE.

3848. **Exposure.**—At mid-day in June or July, about one-twentieth of a second.—H. LEACH.

3849. **Moving Objects.**—Yes. Perhaps the shutter is at fault.—B. J.

3849. **Moving Objects.**—Not without a drop shutter, to get anything like a sharp picture.—W. A. J. CROKE.

3850. **Reducing.**—"Self-Taught" had better make up a saturated solution of ferricyanide of potassium (red prussiate of potash), and add one part of this to nine of the ordinary fixing bath; immerse

B. S. ATKINS.—If the stains on the negative are there before having printed from it, try a weak solution of hypochlorite of zinc. If they are after the plate in this, and the plate will reduce rapidly; for slight reduction reduce the amount of the potash solution. When sufficiently reduced, wash well and dry. The mixed solutions do not keep. The above will reduce negatives intensified with Werner's intensifier (mercury), so will probably suit "Self-Taught."—J. G. P. VEREKER.

3850. Reducing.—It is evident from your query you do not want local reduction, but general. Try the following formula: Take of

Ferricyanide of potassium ... 1 oz.
Water (to make) ... 10 ozs.

Put your plate into a porcelain dish, and cover with water (for a half-plate, say, 2 ozs.), then into the measure pour one drachm of the above, and one drachm of your hypo solution. Pour the water from the dish into the measure, and return the mixture to the plate. *Not vice versa*. When sufficiently reduced, wash well and dry spontaneously.—W. A. J. CROKE.

3850. Reducing.—Soak the negative to be reduced in a solution of hypo-soda of usual fixing strength till the film is soft, then remove it and add a few drops of a saturated solution of red prussiate of potash to the hypo bath; re-immers the negative, when reduction of density will rapidly follow. If the action ceases before the negative is thin enough, add a few more drops of red prussiate solution. Wash well after, and remember red prussiate of potash is poison.—Q.

3851. Intensifier.—

Perchloride of mercury ... 2 drms.
Ammon. chlor. ... 2 "
Water ... 8 ozs.

Filter, and immerse negative until bleached through, then wash well and immerse in

Ammonia '880 ... 1 drm.
Water ... 4 ozs.

when it will turn black, when evenly coloured (by transmitted light), wash well, and dry.—T. A. BLAKE.

3853. Stops v. Iris Diaphragms.—By all means use an Iris diaphragm; they are much better than the ordinary stops in every respect.—Q.

3853. Stops versus Iris Diaphragms.—I should say "Raw Amateur" would find an Iris diaphragm preferable to stops; it is light-tight, cannot be lost nor forgotten, is more convenient to use when focussing, and the exact sized aperture for the picture in question can be obtained. An objection has been raised against it that it wears bright, and is not easily re-blacked by the user; but so do stops, and if well made, it would take a long time so to do. The advantages of stops are that they are cheaper, and the lens mount a little smaller. These do not compensate for the extra convenience of the Iris diaphragm.—J. G. P. VEREKER.

3853. Stops v. Iris Diaphragms.—Get the ordinary stops. The Iris diaphragms are very liable to get out of order, and are sometimes uncertain in use.—H. LEACH.

3855. Canterbury Cathedral.—For permission to photograph the interior, apply to the Dean. Permission is readily granted. I photographed there in Easter week, using Eastman's stripping films (which are slow), $f/32$ stop, on a bright day. The exposure: were about a quarter of an hour for the choir, and ten minutes for the nave, Trinity Chapel, and lighter parts; for the other, darker, parts about the same as the choir. These proved ample.—W. H. H.

3856. Optimum Lens.—One of the cheapest and best in the market. I have used one for the last two years (a 5 by 4 R.R.) with the greatest satisfaction. You cannot have a better.—W. H. H.

3856. Optimum R.R. Lens.—All the Optimum lenses are excellent, and will give you every satisfaction.—H. LEACH.

3856. Optimum R.R. Lens.—These lenses are the finest in the market; you cannot possibly buy better even at a higher price.—WM. A. JACKSON.

3859. Pinholes.—Cover the holes with retouching varnish and allow to dry, and then work over the holes with a H.H.H. lead pencil, cut to a fine point.—H. LEACH.

3861. Focussing Chamber.—This is a very useful instrument, but as it is always best to shade the camera and back, during exposure, with some kind of cloth, I think it hardly takes the place of a focussing cloth for general use.—H. LEACH.

3863. Hydroquinone Developer.—I can strongly recommend the hydroquinone formula I gave last week (3871). It keeps perfectly, and is altogether most satisfactory. About 2 grains of hydroquinone to each ounce of developer is about the right quantity.—Q.

3863. Hydroquinone Developer.—Use Thomas's formula, using 120 grains of caustic potash, instead of 160 grs., per 20 ozs. of water. Have found that the reason why the Ilford developer does not keep is owing to its absence of citric acid.—H. LEACH.

3864. Hanover.—You can obtain Ilford plates and chemicals from S. Federlein, Louisenstrasse, Hanover.—J. H.

3867. Isochromatic Plates.—Edwards do publish with their plates a special developer, but you will find the Ilford on any ordinary pyro, and

ammonia on hydroquinone, do just as well. Why should they want to be printed on any special paper, because they are isochromatic. Print on silver bromide, platinum, or anything else that suits the subject and your fancy.—W. A. J. CROKE.

3867. Isochromatic Plates.—Edwards includes his formula with his Isochromatic plates. I should doubt the Ilford developer suiting them, unless it was diluted with water and the plate over-exposed. The following is a comparative table of the amount of chemicals to each ounce of water:—

EDWARDS'.			
Pyro	...	...	1½ grs.
Citric acid	...	...	½ gr.
Bromide of potassium	...	...	⅓ "
Ammonia ('88)	...	...	1½ minims

ILFORD.			
Pyro	...	...	1½ grs.
Bromide of ammonium	...	...	2½ "
Ammonia ('88)	...	...	1½ "

Any system of printing can be used with Isochromatic plates.—J. G. P. VEREKER.

3868. Spain.—Refer to "British Journal Almanack" for 1889 for Spanish phraseology of photographic terms.—J. H.

EDITORIAL

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED:AM:PHOT:

A. D. GUTHRIE.—Thank you; the information reached us from many quarters.

A. A. CORNELL.—Your letter is inserted; we are sorry it was not in time to stop the publication of your previous communication.

W. J. FITCHER.—We note your remarks and thank you.

P. S. S.—We should advise C if you require a focussing scale; the camera is well made, and if you are careful with the changing of plates no difficulty will be experienced. B we do not care for, and C we have not seen. The A camera will not suit you, as you require a focussing scale. C has a good shutter of the Kershaw type.

LAUREL.—We have asked the firm to give us an explanation, see our leader this week.

J. D. L.—Enlargements are not eligible in either competition.

A. HOGG.—We place the lenses in the following order, B, C, A. You will see that we consider A of the least merit of the three named, which answers your second question.

A. W. GOTTLEB.—We will advise you if you require the negative; shall be pleased to receive any of your work.

C. A. SAMUELS (Maldah).—Your instructions have been handed to our publishers. We shall be very pleased to see your work entered for our competitions. The print sent is not eligible, as it does not comply with our conditions, of which we send you copy by mail. The series you speak of would be eligible for our Tour Competition, particulars of which will be announced after July 1st.

G. PERCIVAL SMITH.—Would you please say when the MS. was sent us?

J. E. HOWARTH.—The "cheap developer" is quite old, and the formula is to be found in almost any of the text-books, but still we thank you for writing us, and your expressed desire to help others.

P. MALDEN.—We will send you the addresses, although contrary to our rule.

T. BAKER.—Your MS. is rather too much in the shape of an advertisement, but we will consider your communication, which satisfies us that the wise men who came from the East are still to be found in the west.

FRAS. DAVIS.—We favour no shutter. If you will comply with our rules (see head of this column), we shall be pleased to advise you. We only see callers on Monday afternoons and Thursday mornings, except by appointment, unless the caller is from the Continent or abroad.

VALENTINE CHARLES.—Cannot help you about the fluid in thermometer. You can get an R.R. lens $5\frac{1}{2}$ inch focus to work at $f/8$, for £2 2s. Other makes will cost you £3 5s. and £3 10s.

MR. E. F.—Will give you an opinion upon negatives next week. Prints, which we return, are only fair work. Three of them are over-exposed, and the lighting of the other leaves much to be desired. Your toning bath should have more gold. Choice of subjects might be improved. We shall be glad to see more of your work later on.

A. L. BARKER.—All the cameras made by the firm you ask about are reliable and well worth the money. We do not know that one is better than the other.

H. T. LINGING.—The effect would be that the prints would not tone so readily, and would not be

so good a colour. Have you read "Platinum Toning" (Clark); if not, you should do so at once.

WORCESTER.—The fault lies in the fact that No. 2 solution has been far too strong. A solution of plain soda will strip the film from the glass. Weaken the solution and have more patience. You should not attempt such views without first backing your plates.

AULD REEKIE.—The solution of chrome alum has been too strong, the effect being to draw and harden the film. We are much afraid there is now no remedy, and can only suggest that possibly, by prolonged soaking in water, the alum might be washed out.

PERCIVAL BULL.—Your account of the affair is really very funny, but as the two extra swans are in no way like the two you say you photographed, they cannot be ghosts. We think they must have shot out from the bank "unknown." We must compliment you upon the picture, which is certainly above average.

LIZZIE T.—Very sorry your prints have been placed on one side. In No. 1 you have too many figures, and they are awkwardly placed; the foreground should have been less, and, as a consequence, you would have had more sky. No. 2. The same remarks apply as to foreground, which lacks definition. No. 3 is well chosen, but your negative is flat and wants contrast. No. 4 shows much artistic judgment in selection; but in this picture, had you had less foreground, you would have got in the tops of the trees on both sides of your picture, which would have helped the composition. It is, however, a very delightful picture. No. 5 has not much interest. In No. 6 you have lost the tops of all the trees, and your figures are not well placed. As a whole the work is very fair, and we are surprised that results could be secured with a whole-plate set costing only £3 3s. You should buy a better lens; the one you have does not give sufficient depth. Don't force development, as by so doing you get thin negatives. Print a little deeper, and in toning use a little more gold. Hope you will compete in our next "Ladies' Competition." Very pleased to see your work at any time. Your progress is marvellous.

COUNT D'ASSCHE (Paris).—We will answer by letter.

PHOTO-MICROGRAPHY.—We insert as a query. L. F. R.—You will find S and F very satisfactory. The shutter works well. The plates must be backed. We think if you have a sufficiently rapid lens you will with the camera have no difficulty in securing the subjects you desire. F is a useful camera, but hardly what you want. A B will not be of service to you. Shall be glad to help you in any way.

W. ASHBURNER (Wimbledon).—Messrs. Salter and Co., of Folly Bridge, Oxford, will give you full particulars. The boats leave Kingston for Oxford on Mondays, Wednesdays, and Fridays, about 9 a.m. J. H. MOUNTJOX.—A. A very decent camera, and will do all you require. B. We do not think so, and do not advise them. We should say D. They are, we believe, both French lenses; but the D is in purchase in very large quantities, and mount all their lenses themselves. E. We know very little about the shutter, and, therefore, cannot pass an opinion upon it. F is certainly much better, and thoroughly reliable. Thanks for your complimentary reference to the value of our opinion.

L. PRESTON.—The book is "hung up" by the author. We are worrying him.

J. N. REESEN.—We do not advise, and cannot write you; but must request that you comply with our rule—see head of this column.

B. J.—Certainly not; but they are the better for rolling.

A. JORDAN.—We should use No. 1, and err rather on the side of over-exposure. The single lens should give you a very fair picture of the pier, etc.

T. T. M.—We do not think it all likely, and have no data to go on. We certainly have not time to write to fourteen firms in order to acquaint you whether they sell goods on the easy instalment system. See remarks in "Our Views" on this matter.

O. E. F.—We do not consider dextrine a satisfactory mountant; but here are the particulars:—

Pure white dextrine ... 1 oz.
Boiling distilled water ... 3 ozs.
Methylated spirits ... 4 ozs.

Stir till dissolved, and strain through calico.

G. H. GRANT.—Very sorry; but really we cannot read your post-card.

BOY AMATEUR.—Dry plates, in the following order:—II, I, III, V, VIII. Others follow in any order. Developer:—III, II, I, IV. Paper, in order as you should take them up:—Albumenised, bromide, platinum. Any further particulars will be gladly furnished.

CYMRU.—Have not seen the camera, so cannot help you.

ORATES.—The camera is perfectly useless, and would not hold together in a tropical climate for a week. You would do just as well with a cheap quarter-plate, using it as a hand-camera, and fitting it in a case or box.

B.—Certainly; they will come under "Landscapes" if they are what you describe.

J. WEST.—The slides are well made; but the firm are very dilatory and unbusiness-like.

printing, caused by the silver albumenised paper adhering to the film, you will have much difficulty in removing the stain. Wall, in "Dictionary of Photography," recommends local application with a tuft of wool saturated with a weak solution of cyanide of potassium, and gives the following:—

Sulpho-cyanide of potassium	10 grs.
Nitric acid	5 minims.
Distilled water	1 oz.

First Ladies' Photographic Competition.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent., the minimum being one shilling, upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Almanacs, etc.—13 Photographic Almanacs and Year Books, some scarce; 6s.—Walker, Sootholme, Nottingham.

"Amateur Photographer," etc.—114 numbers AMATEUR PHOTOGRAPHER, 2s of "Photography," and four "Year Books;" 7s. 6d. free.—E. Galloway, Gladstone Terrace, Gateshead.

AMATEUR PHOTOGRAPHER, vols. vii., viii., ix., x.; "Amateur Work," vol. iii.; half-yearly, vol. iv.; "Leisure Hour," 1834, last three bound; crystalline painting materials, complete, 20s.; exchange "Photography."—Ed. Mason, Askridge, via Bedale.

Burnisher.—Burnisher for sale, Vever's 6½ in., with spirit lamp, good as new; price 10s.—Bartholomew, Great Linford, Bucks.

Cameras, etc.—Half-plate, double extension, swing and reversing back, two slides, 18s.; whole-plate landscape camera, one slide, 8s.; half-plate burnisher, new, with lamp, 9s.; Demon detective, complete, 3s. 6d.; no approval; stamp for reply.—Thomas Dukes, 8, Heath Street, Stourbridge.

Lancaster's quarter-plate Merveilleux camera and double dark-slide, nearly new, two porcelain trays, two printing frames; 13s. the lot, cash.—G. D. P., 69, Avondale Road, Peckham, London, S.E.

Camera and Lens.—Half-plate camera, with Lerebours et Secretan lens and dark-slide, in good condition, been used in a professional's studio; cost £7; price £3.—Mr. Lennard, 29, Clarence Street, Marsh Lane, Preston, Lancashire.

Camera, Lens, etc.—Quarter-plate camera, lens, and slide, suit beginner; 10s., post free.—James Thomas, 1, Griggs Terrace, Port Talbot.

Lancaster's quarter 1839 Instantograph camera, two double slides, canvas case; 28s.; or with rapid rectilinear lens, 43s.; little used.—B., 59, St. Thomas Road, Finsbury Park.

Dark-Slide.—Lancaster's double half slide, metal, never used; 4s. 6d., or exchange.—Maides, Midhurst.

"Encyclopædia," etc.—Blackie's "Encyclopædia," fourteen bound vols., condition new, splendid work; "Old and New London," complete, unbound, 70 numbers, cost £2 4s., condition new; money offer, or exchange photographic apparatus. Cabinet portrait lens wanted.—J. W. M., 574, Old Ford Road, Bow, E.

Hand-Cameras.—Optimus Magazine detective camera, new; cost £5 6s.; what offers?—N., 5, John Street, Ryde, I.W.

Stirn's detective camera, large size; cost originally 42s. 6d.; perfect condition; what offers?—Faulkner, School House, Clifton College.

Hand-camera, Diamond pattern, for 12 plates 3½ by 2½, new, with one dozen plates; 22s.—Mann, 3, North Hill, Colchester.

Stirn's Secret camera, perfect; 16s.—Thornton, 43, Walton Street, Chelsea.

Hand-Cameras, etc.—Optimus hand-camera, 5 by 4 R.R. lens, six double backs, to hold 12 quarter-plates or films, the shutter works at any speed up to 1/10th of a second; can be used on a tripod for time exposures; in perfect condition; price £5; originally cost £7 11s. 6d.—To be seen at Browning's, 63, Strand, W.C.

Lenses.—Grubb's quarter-plate patent instantaneous landscape lens, 19s.; also French portrait lens, for cartes, 13s.—Kellow, 63, Alexandra Road, Hampstead.

7 by 5 rapid Euryscope (Optimus); £3 10s.; cost £1 14s. 6d.—Shaw, 42, Castle Street East, Oxford Circus, W.

For sale, a rapid portrait lens (by Ross), diameter 2½ ins.; focal length 10½ ins., rack and pinion; price £2 2s.; cost £9 9s.—Harcastle, East Street, Brighton.

Suter's Aplanatic 8 in., new; 55s.—Summers, jun., 28, Cheapside, London.

Carte-de-visite lens (Squire, London), 7,100, and stops working f/4, cheap, 35s.; will exchange for good quarter-plate camera or Tylar's half-plate metal slides, etc.—Blake, 8, Myrtle Grove, Kenilworth Road, Seacombe, Cheshire.

Fine 7 by 5 R.R. lens, with Waterhouse diaphragms, new, 35s.; half view lens, Waterhouse diaphragms, working f/8, 10s.—McComas, 5, Laurence Pountney Lane, City.

Excellent half-plate landscape lens; 7s.—W. Shepard, 19, Surrey Street, Derby.

Lenses and Shutters.—Lancaster's half-plate instantaneous lens, shutter, and Iris diaphragm.—Short, 13, Endymion Terrace, Finsbury Park.

Lancaster's half-plate instantaneous lens, Iris diaphragms, and shutter, in perfect order; 20s.—James Johnston, 17, Hamilton Drive, Hillhead, Glasgow.

Ross' 9 by 7 lens, and Newman's shutter to fit, both new and in perfect order; will take £8; or will sell separate, £5 5s. and £1 5s.—Apply, H. W. Fielden, Barbican Court, Barbican, E.C.

Lens, Tripod, etc.—Lancaster's half-plate Instantograph 1887, lens, tripod, shutter, one single and two double backs, in excellent condition, 45s.; also quarter-plate camera, wooden body, tripod, portrait lens, and one single back, bargain, 15s.—Photo, 262, Kirkstall Road, Leeds.

Negative Paper.—Bargain, six dozen 5 by 4 Eastman's improved negative paper; 3s. 3d., free.—Gee, 11, Richmond Crescent, Barnsbury.

Photometer, etc.—Decoudun's photometer, re-

touching desk, view finder, Stirn's detective camera; what offers?—Address, Wm. Bell, Northallerton.

Plates.—Offers for eight unopened boxes Ilford stereoscopic plates, warranted new and perfect, no further use to owner.—H. Smith, Netherleys, Colne, Lancashire.

Sets.—International Lancaster's quarter-plate camera, rectilinear lens, with Waterhouse stops, instantaneous shutter, tripod, two double dark-slides, waterproof case, washing tank, rack, nearly new; price 65s.—D. Swain, 28, New King Street, Bath.

What offers for Lancaster's Special patent quarter-plate camera, rapid Rectigraph lens, three double dark-slides, shutter, tripod? Cost £7.—E. Mayhew, 36, Castle Road, Kentish Town, London.

Lancaster's 1890 half-plate Instantograph, dark-slide, tripod, and f/8 rapid rectilinear lens, quite new; cost 105s.; bargain, 73s.—E. Ernest, 2, Hawthorn Villas, Slad Road, Stroud.

Quarter-plate Rouch's camera, four double backs, leather case, and stand, 60s.; rapid rectilinear lens, fitted with Newman's shutter, 40s.—Wm. G. Walker, 87, Union Terrace, York.

Lancaster's quarter-plate Instantograph, with three double slides and three metal slides, tripod, good lens and shutter, all in excellent condition.—What offers to Miller, 23, Listria Park, Stoke Newington, London.

7½ by 5, square reversing, long extension, Spanish mahogany camera, rising front, etc., including stereo front and partition, three patent double backs with pillars, Optimus R.R. 8 by 5, pneumatic drop shutter, Ashford's stand, and cases only bought last season; £12 10s.; or, without lens, shutter, and stand, £8 10s.; seen any time by appointment; no cards.—Photo, 173, Hemingford Road, Islington, N.

Half-plate Instantograph set, with four double dark-slides, lamp, and wood travelling case, 60s.; quarter-plate Optimus set, with one double back, complete, 30s.—Regius, 53, Clapton Common, N.E.

For sale, 10 by 8 double extension camera (Spicer), carriers from quarter-plate, dark-slide, and changing box, Ross' actinic doublet, tripod; price 10 guineas; in first-class condition.—T. G. Mellors, 17, Newstead Grove, Nottingham.

Whole-plate Lancaster's Special patent camera, lens, stand, time-instantaneous shutter, as new; £5; approval; deposit.—F.O.S., 5, Royal Hill, Greenwich.

Whole-plate camera, all movements, Ross' R.R. lens, four backs, tripod, etc., leather case; cost £24; offers; would sell camera without lens.—Sinclair, Woodville, Putney.

Lancaster's Instantograph half-plate lens, 10s.; quarter-plate Le Merveilleux camera, lens, two double slides, stand, 15s.—W. Powell, 3, Tintern Street, Brixton.

Half-plate camera, Underwood's Exhibition, three double dark-slides, carrier, solid black leather case, and new four-fold stand; price £4 10s.; approval.—W. Morrison, Napier Road, Luton.

Set, etc.—Half camera, three metal slides, stand, R.R. lens, £4 10s.; flute, cost 10 guineas, price £4; plated cornet, cost £7, price 50s.; Diamond Safety bicycle, £7, list £12; magic lantern, 30s.—P., Decorator, 2, Peter's Street, Norwich.

Shutter.—For sale, Kershaw's shutter, cost 16s., without tube, in perfect condition; price 9s. 6d.—H. Bell, Edwalton House, near Nottingham.

Trippods.—Sliding oak tripod, with top (suit Lancaster's half or quarter plate cameras), fitted in waterproof case, complete; 7s. 6d.—Gardner, 45, Parliament Hill Road, Hampstead.

WANTED.

Cameras.—Lancaster's 1839 Instantograph quarter-plate, complete; approval; full particulars.—Beveridge, 20, Albert Drive, Crosshill, Glasgow.

Camera, etc.—Half-plate camera, with dark-slide, box or bellows, without lens, cheap.—Cartwright, 25, New Road, Willenhall.

Camera, Lens, etc.—Lancaster's quarter-plate Instantograph, brass-bound, latest pattern, complete, Eastman's quarter-plate roll-holder, latest pattern, also Wray's 5 by 4 Casket lenses, all must be in first-rate condition.—Full particulars and price to Capt. Burne, Glen Parva Barracks, Leicester.

Whole or quarter plate, each three double backs, Ross' rapid symmetrical, offered in exchange for good half-plate.—2, Sussex Place, Southsea.

Camera and Lens.—Portable camera, must have latest improvements, not smaller than whole-plate; also lens.—Mater, Nut Grove, Chew Magna.

Camera Case.—Good half-plate camera case, cheap.—Short, 13, Endymion Terrace, Finsbury Park.

Dark-Slides.—Six quarter-plate and two or three half-plate Tylar's metal slides.—S. Playne, 62, Mer-van Road, Brixton.

Three double dark-slides, for half-plate Le Merveilleux.—Tilson, Westthroughton, Lancashire.

Hand-Cameras.—Shew's Eclipse hand-camera, 4½ by 3½, fitted with roll-holder, perfect condition; approval.—Miss Richardson, Crescent, Ripon.

Dot hand-camera, in exchange for Le Merveilleux quarter-plate, with double slide, folding stand, three vulcanite dishes, two printing frames.—Long, 77, Shirley Road, Southampton.

Leather Case, etc.—Leather case for 10 by 8

camera, and three double backs; must be good and cheap.—Bond, Bodmin.

Lenses.—Lens, Steinheil's No. 1 aplanatic, $\frac{1}{4}$ in. diameter, $1\frac{1}{2}$ focus; on approval.—State price to T. Tinne, Hawkhurst, Kent.

Lens, cabinet portrait, very cheap. — Photo, 84, Park Street, Bristol.

Good wide-angle rectilinear lens, also R.R. half-plate.—A. L. Barker, Trinity, Cambridge.

Wray's landscape lens, wide-angle, $\frac{7}{8}$ by 5.—Summers, 148, Stanstead Road, Forest Hill.

Photographic Outfit.—Photographic outfit; will give medium sewing machine, with four drawers, extending leaf cover, new from the maker; £3 5s.; approval both ways; outfit must be good.—Sykes, Crowther, Pudsey.

Roller Slide.—Eastman's quarter-plate roller slide.—J. Taylor, West Town, Dewsbury, Yorkshire.

Sets.—Whole-plate camera set; approval.—Apply, Pitcher, 155, Kingsland Road, London.

Ross's portable symmetricals, 3 and 12 in. focus, walking-stick tripod; also light quarter-plate camera.—Jas. Cartledge, Birkendale, Sheffield.

Quarter-plate outfit, with slides; must be good.—John Barrow, Pudsey.

Tripods.—Ashford's three-fold stand, 6 in. top, cheap for cash.—W. Morrison, Napier Road, Luton.

Three-fold tripod, closing 20 ins., opening 5 ft.—Batty, Denman Drive, Liverpool.

OUR VIEWS.

To hold as 'twere the mirror up to nature."—Shakespeare.

PARTICULARS have come to hand of the holding of the fifty-eighth annual exhibition of the Royal Cornwall Polytechnic Society. The exhibition, which includes a section for "Photographs by Professionals and Amateurs, Photographic Appliances, etc.," will open at Falmouth on Tuesday, the 26th August, 1890, and will continue open for five clear days. No charge is made for space. List of prizes and all further information may be obtained of the Secretary, Mr. Edward Kitto, F.R.M.S., the Observatory, Falmouth, or of Mr. W. Brooks (member of the General Committee), Laurel Villa, Wray Park, Reigate.

* * * *

THE Bulmer case has, we think, given much satisfaction, but we very much regret that the name of Mr. F. C. Pattison, of Montford Place, Upper Kennington Lane, London, S.E., should have been drawn into the case. We find that he is not in any way associated with Mr. Bulmer, as Mr. Fallowfield led us to suppose, and that, far from aiding Bulmer, he has narrowly escaped being a victim. We personally beg to accord Mr. Pattison a full apology, and to offer our sincere regret that his name should have been coupled with that of Bulmer. Mr. Pattison is an amateur photographer, and, like many of our subscribers, buys and sells through our "Sale and Exchange" columns, and is not a dealer in photographic apparatus.

* * * *

THE PHOTOGRAPHIC SOCIETIES' REPORTER for May 31st contains a portrait of Mr. Alexander Keighley, who occupies the dual position of President of the Bradford Amateur Photographic Society and the Keighley and District Photographic Association, distinguished honours for so young a man. The work done by Mr. Keighley is now well known, and we feel certain that he will occupy a front position amongst the best workers wherever his pictures are exhibited. It may not be generally known, but all his pictures are thought out and composed in a pencil drawing before the lens sees them. The REPORTER also contains several good articles, notably, "Photographic Chemistry," by E.

J. Wall, "Photo-Micrography," by Allan L. Hall, F.C.S., "Cloud Photography," by J. J. Hollway, "Artistic Photography," by Joseph W. Spurgeon, "Stereoscopic Photography," by L. R. Strangways, M.A., "Photographic Picture Making," by Haley Wilson, "Art in Photography," by George Phoenix. We have named sufficient articles to show that there is much to be learnt from a careful study of the pages of the last number of the PHOTOGRAPHIC SOCIETIES' REPORTER.

* * * *

THE arrangements for the exhibition to be held in Edinburgh under the auspices of the Photographic Society progress satisfactorily. A meeting of the members was held last week, at which it was decided that the exhibition should be opened on the 14th of November, and remain open until the 7th of January. In addition to the ordinary character of photographic exhibits, it is intended to illustrate, historically and technically, the processes connected with the art in their various stages, and for this purpose the Council invite the co-operation of those possessing unique specimens, especially of the earlier processes and apparatus. No charge will be made for space, while it is considered desirable that each competitor should send in not less than three pictures in each class. There are altogether nineteen classes, in eighteen of which one silver and one bronze medal will be given, while in the 19th class, for apparatus, materials, etc., three silver and three bronze medals will be awarded. In addition to these, a gold medal will be awarded the picture possessing the highest degree of merit, irrespective of size or subject. The whole of the classes, except 11 and 12, are open, class 11 being landscape, confined to amateurs, and class 12, photographs of any subject, confined to amateur members of the Edinburgh Society.

We trust the Council will keep us advised of their movements in order that the exhibition may be kept before the world. At the same meeting, we understand from the *Scotsman*, that "a communication was made by Mr. Hugh Brebner embodying the results of investigations

TRAVELLING STUDENTSHIP COMPETITION closes June 14th, 1890.

which he had recently made of the phenomena of reversals.' As an outcome of many experiments, Mr. Brebner stated that he had discovered that under conditions where a negative was now taken in a second, a 'positive' could be taken in a three-hundredth part of a second; and that where less was necessary, a small stop, a darkened room, or a red light might make the exposure short enough."

* * * *

As an appendix to our "Dark-Room" list, we are compiling a list of towns on the Continent where photographic materials may be purchased, and where, in many places, the use of dark-rooms may be secured. In this list we have incorporated the names of towns and dealers published in the May number of *Photographic Scraps*. Those contemplating a tour on the Continent would do well to possess themselves of a copy of that very useful number of *Scraps*. We have also made considerable additions to the list, and shall be glad of any further help from subscribers or others.

* * * *

It will be seen by a letter in another column that Richmond is to have a photographic society, which it is probable will be under the Presidency of Major J. F. Nott. The members will be indeed fortunate if the gallant Major will accept office, and we are sure that everyone in Richmond and Twickenham who "goes in" for photography will be eager to join the society.

* * * *

MESSRS. HAZELL, WATSON, AND VINEY, LD., have prepared a well-designed "Certificate of Merit" for the use of photographic societies. It is made in two sizes, viz., 12 by 10 ins., and 15 by 12 ins. These are worth seeing, and the firm will be pleased to forward specimens on receipt of applications from Secretaries of societies.

* * * *

We publish a short paper on "Eikonogen as a Developer for Bromide Paper;" the result of experiments made by that very careful worker, Mr. Greenwood Pim, M.A.

* * * *

WE have been asked to state that the Liverpool branch of the Y.M.C.A. have a Camera Club which has been established for more than twelve months, and has a large number of members, who are doing good work.

* * * *

THROUGH the courtesy of Mr. J. J. Briginshaw, the Hon. Secretary of the Photographic Convention, we are in a position to give further particulars, and are pleased to note that the programme of arrangements is much more carefully drawn up than last year. The Convention will be opened by the President, Mr. C. H. Bothamley, F.I.C., F.C.S., on Monday, the 23rd inst., in the Town Hall. The Mayor of Chester has invited the members and visitors to a conversazione to be held on the evening of the 23rd, and many other arrangements have been made for the social enjoyment of those attending the Convention. The educational side will not be neglected, and, as far as at present arranged, the following papers will be read:—"The Records of Photo-micrography," by Andrew Pringle; "Imagining and Imaging," by P. H. Newman; "Orthochromatic Photography with Rhodamin," by C. H. Bothamley, F.I.C., F.C.S.; "Photography in Norway," by Paul Lange; "A Magazine Camera and Lantern," by Friese

Greene; "Astronomical Photography," by A. A. Common, F.R.A.S. Reports will be received and read from the Lens Standard Committee, and also the Weights, Measures, and Formulæ Committee.

The Town Hall will be open daily from 10 a.m. to 6 p.m., and there will be an exhibition of novelties, photographic apparatus, etc. On Friday evening there will be a dinner and smoking concert at the Grosvenor Hotel, and on Saturday a lantern entertainment, open to the public. Dark-rooms have been placed at the disposal of the Council for the convenience of members, by several of the leading photographers of the city and also by the Curator of the Grosvenor Museum. We have said enough to show that a glorious week of pleasant and profitable work is in store for those who can spare the time to attend the Photographic Convention at Chester.

* * * *

FROM the *Stationery Trades Journal* we are glad to find that action has been taken by Messrs. Poulton and Sons, to prevent piracy of photographs which have been copy righted. The *Journal* says, "You may not pirate your neighbour's pictures, whether they be photographs or engravings, or lithographs, or photogravures, or otherwise produced. They are as much his property, until the term of copyright expires, as the coat on his back, and those who copy them without permission, or even sell unauthorised copies of them, do so at their peril. If, on the other hand, you happen to be the sufferer from the piratical operations of somebody else, take care that, before you begin legal proceedings, you have a written transfer of the copyright of the photograph or picture from the man who took or drew, or otherwise made it, as well as entering it at Stationers' Hall. See the case *Barraud v. Cox*."

* * * *

WE have frequently in recent numbers drawn attention to "school photography," and we have just received the following very interesting account of the Clifton College Photographic Society.

"Most of our public schools have photographic societies. There is one at Clifton College, which has for its President a master, and a boy for its secretary, who is in the sixth form. The number of boys in the society is about twenty. They have a big dark-room with four sinks, and two doors to enable anybody to come in while another is developing. The toning can be done by an assistant, or by the boys themselves. The President supplies all chemicals at a very moderate price per term, not including plates and printing, or, if the amateur wishes, he can keep his own chemicals, as only the pyro developer is supplied. The assistant teaches new amateurs the *modus operandi*. There is a competition at the end of the term for interiors and landscapes; the photographs, of course, must have been done by the amateur himself without any help from the assistant. There is a prize given for the first in merit, and stars of honour to the next three or four; they are judged by an eminent amateur, and afterwards exhibited to the whole school, whose criticisms are very severe. There are outings about once a fortnight, all the expenses being paid for. Clifton is really a very picturesque place for photography, there being many objects of interest to photograph; for instance, the Suspension Bridge and the Observatory, not mentioning the beautiful scenes on the Avon. Even the College itself is an object of attraction to photographers."

This letter is characteristic of the boy mind, and shows his pride in, first, his college and its surroundings, and, secondly, the satisfaction with which he approves of all that is done for him in connection with the delightful pastime of photography.

Letters to the Editor.

FILCHED AMATEURS.

SIR,—In your last issue you very wisely exposed the dishonest actions of Mr. Bulmer. But are not some of the widely known dealers equally deserving of censure? I consider that we, as customers, are entirely at their mercy.

Some little time ago I sent stamps for new catalogue to a firm in Leeds. Up to now neither catalogue nor stamps has arrived. About the same time I sent stamps for a rose-tap to a firm in Lambeth. I have heard nothing more of either.

Last summer I was going to Ingleton for an outing, and obtained a packet of half-plate 60-times for use, as the day was rather dull. I exposed the whole of them, and in developing found that the plates were perfectly worthless, not yielding one good negative.

On asking the dealer the reason, he told me with a smile that they had been in the shop for years. But he refused to make me any allowance. The same firm supplied a friend of mine with a box of half-plate Ilford's, in which five were hopelessly broken. No allowance was made in this case also.

Now, sir, ought there not to be some means of redress in such cases as these? Dealers are sharp enough in protecting themselves by demanding "cash with order," while we are expected to put up with any kind of treatment with the greatest placidity.

VICTIM.

* * * *

THE BULMER CASE.

SIR,—Mr. F. C. Pattison, of 6, Montford Place, has called upon me in reference to your paragraph last week, and has shown me correspondence proving that instead of helping to procure goods for Bulmer he was in reality one of his victims, though, fortunately, he got his money back, when Bulmer found I took no notice of his order.

I am glad there is a prospect of your exposing the ways of the so-called photographic dealers; but I certainly think the victims have themselves to blame for sending orders to perfect strangers without even a reputation to lose, when there are dealers whose forty years' record is sufficient guarantee that customers get good value and receive prompt attention.—Yours faithfully,

JONATHAN FALLOWFIELD.

35, and 36, Lower Marsh, Lambeth, S.E.,
June 6th, 1890.

SIR,—I am not concerned to defend the above-named person, whose system of dealing appears only equalled by the tradesmen "with shops," darkly indicated in your well-timed leader last week. But, in common fairness, I take exception to Mr. J. Fallowfield's animadversion on Mr. F. Pattison's style of business. From this person I have bought barely soiled photographic goods, by the best makers, at about two-thirds of the cost price, with which I am most thoroughly satisfied. This testimony is due to Mr. Pattison.

The whole gist of the matter lies, however, very much deeper than those reading casually may suppose. "A Leading Lens Maker," Messrs. Lancaster and Co., Mr. Fallowfield, and Mr. Robert Abraham all make it a basis of complaint that their goods should be offered to the public much below their retail prices. Such a grumble might be all very well in a journal devoted exclusively to trade protection; it is perfectly out of place in one conducted in the interest of the amateur. There is probably no business under the sun which offers such opportunities of unfair dealing to the trader, wholesale and retail, as does photography. Articles, the intrinsic value of which may be a few shillings, are advertised far and wide, and consequently sold for as many pounds. Nor is this all. On every side are found complaints of the miserably deficient workmanship of cameras, and all apparatus supplied not only by the makers by some misnomer called cheap, but also by others who can only be called additionally dear. On the other hand, there are tradesmen who rove about town collecting apparatus discarded for that of other or better makers, or larger or smaller sizes. These, if good, they sell at prices very much under their original cost, and no doubt the shopkeeper holds them in aversion. These are not the men who should be "exposed" and discouraged, but the manufac-

turers, who are the true parasites of the amateur, without whom they would not exist a day, who cringe to him, bleed him, cheat him, mock him, all in turn, and rely upon extensive advertisement in order, as they think, to prevent well-merited exposure.

I indicate no one, but I follow up the excellent criticism of your article this week by the suggestion that a well-scrutinised plebiscite of the worth and reliability of makers might with great advantage be conducted in your most valuable journal.—Yours faithfully,

H. S. SCHULLESS YOUNG

3, The Temple.

(Barrister-at-Law).

THE HIRING SYSTEM.

SIR,—In reference to your leader in the AMATEUR PHOTOGRAPHER of the 6th inst., I cannot submit to the imputation, which is a very strong one, as I have done no trade on anything except in a business-like manner. Still, I find, through the carelessness of a former employé, certain grounds for complaint have been given.

The facts are these:—At the dissolution of a firm in 1889, in which I was interested, I purchased at the auction sale a few of the articles, namely, four cameras and two lenses by different makers, and not finding any use for them, I tried to dispose of the same. "Batten," seeing the enquiry in your paper asking for photographic apparatus on hire, having had the same himself some months ago, answered it, the replies to which he sent to me. I replied to the enquiries, using a copy of an old circular. No remittances have been received, and the only complaint is, the non-reply to correspondents who wished for goods which I had not got. I must state that I do not carry on the photographic or hire business, directly or indirectly, beyond the few things which I have stated. Therefore, your caution to amateurs against doing business with me is perfectly useless. It would certainly have been better before warning your readers to have made some enquiries, directly or indirectly, as to who I am, your information having no basis except on the facts stated above, therefore I shall look for your contradiction of the statement you made in your last week's issue, for it is now six years since I first let goods out on the hire system, and this is the only complaint.—Yours truly,

(MRS.) C. A. BAINES.

NOTE.—We have given the information as we received it, and, though at the risk of being considered ungallant, endorse every word that we have said against the "system."—ED : AM : PHOT.

THE EXECUTION OF ORDERS, ETC.

SIR,—I beg to thank you for your article *re* unreliable photographic dealers. I could a tale unfold of a perfect hand camera for which I paid £7 in Easter week, and which, notwithstanding letters and telegrams, I could not obtain delivery of till Whit Monday—seven weeks after payment. I have promptly returned it, as being hurriedly finished and not by any means perfect.

I am promised, after more waiting, a perfected instrument, and have full hopes that by the summer of 1891 I may be in possession of my purchase.

I think the possibility of such an article being forthcoming in your paper must have leaked out, as I have of late had profuse apologies and excuses for the delay—in fact, quite decent business letters, where originally I could with difficulty obtain an acknowledgment of my cheque. I only trouble you with this to show that there are large numbers of us who, though silent, are being served in the way you so well describe.—Yours faithfully,

June 7th, 1890.

J. R. M.

ALBUMENISED PAPER.

SIR,—In the "Complete Photographer" (page 393, present volume), on "Silver Printing," one is told to avoid the double albumenised paper. Will you kindly inform me what the objection to it is? I have been using it for some time past (Schölzig's), and though at first I obtained good results with it, I cannot do so well with it now, though I use exactly the same formula as I have always done with it. (I should say I only use small sizes, which may possibly be cut from remnants.)

THE "IDEAL" HAND-CAMERA.

As I am writing to you, let me say a few words anent Abraham's "Ideal," which you praised very highly recently (page 320, present volume). I was induced by a cursory look at the camera at the Crystal Palace, to give an order for one of these cameras, and was told that there was such a run on them that I

could not be supplied with one under a month. As a matter of fact, it was considerably over that time before I got it.

I should mention that I had it fitted by Abraham with a Taylor lens, which I expect is not improved by being removed from its setting as sold by the firm, and fitted into the Ideal. I tried it against the Eclipse lens, and found but a very slight difference between it and the last named.

The focussing arrangement of the camera is also *most unreliable*, there being far too much *play* in it. Indeed, by tilting the camera forward, the index runs of itself to one end of the scale, and by reversing it, it flies to the other end.

The speeding of the shutter is also very defective, not giving anything like the range claimed for it. The shutter is also said to be self-setting, but it is evident from the working of the trigger, that the action of pushing it in (and it takes a *long push*, rendering it almost impossible to take a real *snap-shot* with it) evidently does the real setting, that is, gives the tension to the spring—and also pushes up the lens $\frac{1}{2}$ of an inch with it!

Altogether, this camera, in its present condition, I consider very imperfect, though I believe it to be susceptible of improvement.—Yours, etc., J. R.

NOTE.—We can, of course, only speak of the camera which we had an opportunity of inspecting.—ED: AM: PHOT.

* * * *

PHOTOGRAPHIC SOCIETY FOR RICHMOND.

SIR,—With reference to my letter in the AMATEUR PHOTOGRAPHER of May 30th as to the possibility of starting a society in Richmond, I am glad to say that I have had a very kind letter from Major J. Fortuné Nott, who promises to do all in his power to assist the proposed society.

I have had a few communications from gentlemen who saw my former letter, and who would join the society, and I should be glad if any other gentlemen similarly disposed would let me know as soon as possible, so that a preliminary meeting may be called, and the foundations of the society laid before the holiday season begins.

I must not omit to mention that Mr. H. Maclean, the President of the Croydon Camera Club, has been good enough to give me the benefit of his experience in founding that club, and with many thanks to yourself for your kind assistance, I am, yours faithfully, E. G. RICHARDSON.

20, Hermitage Villas, Richmond, Surrey,
June 10th, 1890.

* * * *

DECOUDUN'S PHOTOMETER.

SIR,—In your issue of last week but one, and in your column of "Answers," I noticed that two gentlemen had been running down that useful instrument, namely, Decoudun's photometer. I think if these gentlemen would give the instrument a fair trial, they would alter their opinion. I have used one for a good while, and always found it to give me a reliable exposure. Perhaps they do not know how to use it. If not, I shall be glad to tell them if they like. As late as last Saturday it was used to determine the exposure, and it answered well. I think it is not the right thing to do to run it down, and as I am using it every week, I felt I could not see it spoken about so badly. I may say I always use it, and can confidently recommend it to every amateur photographer. Trusting you will insert this in your next issue, I remain, yours, C. W. CORBISHLEY.

* * * *

LANTERN SLIDES.

SIR,—May I ask whether any of your readers have any old magic lantern slides or photographs of any description which they could spare us for our guild?

We have now a membership of over 1,200, and the difficulty of providing suitable games and recreation for our social evenings is increasingly felt, owing to our great need of funds.

Any gifts of this description would be a great help to and would be much appreciated by "our girls."—Yours obediently, W. S. CAMPBELL.

The Girls' Guild of Good Life,
Hoxton Hall, 128, Hoxton Street, N.
June 2nd, 1890. (Assistant Secretary).

KODAK LENSES, ETC.

SIR,—I had no idea when I drew attention to the above matter that I should raise such a free fight as is now going on. But as "it is an ill wind which blows no one any good," so this discussion has developed one fact very clearly, viz., that known (fixed) focus lenses need not be achromatic: the only use of achromatism being to assist in obtaining a visual focus. This is an important fact, and ought to revolutionise the manufacture of fixed-focus lenses; for as two glasses can be made for sixpence, and the mounting of them in a plain way ought not to cost more than half-a-crown, the whole thing might be sold for three shillings. Some of our enterprising opticians might well turn attention to this.—Yours, etc., FRED. DAVIS.

* * * *

THE LONDON ECLIPSE OF THE SUN.

SIR,—I observe in your issue of June 6th, under the heading "Science Notes," that photographers will have a chance on the 21st inst. of having a shot at Father Sol, as an eclipse of the sun occurs on that day.

Kindly allow me to correct the date, and give the following information for those who may wish to know when to be on the alert with their cameras. The eclipse will be on the 17th inst., when about one-third of the sun's lower limb will be obscured, and will be the most important visible in England till May, 1900. It is a return of the celebrated eclipse of 1836, which was annular in the north of England.

The following table shows the time of occurrence and magnitude:—

	Greenwich.	Edinburgh.	Dublin.
Begins ..	8.20 a.m.	8.22 a.m.	8.1 a.m.
Middle ..	9.23 "	9.14 "	8.55 "
Ends ..	10.31 "	10.10 "	9.53 "
Magnitude	0.368.	0.257.	0.279.

—Yours truly,

J. W. CAMPBELL.

STAINS ON BROMIDE PAPER.

SIR,—Judging by the queries which appear from time to time, the above form a great stumbling-block to many workers. The most effective method of printing bromides is certainly the use of sheets larger than the negative, leaving a white margin all round the print by means of a suitable mask, and subsequently mounting them on plate-sunk mounts. But the difficulty hitherto has been to preserve this margin of a pure whiteness, and, troublesome as this is with ferrous oxalate, it is much more so with hydroquinone. Now, no one who has developed these papers both with iron and quinol can have failed to observe the infinitely superior image given by the latter; in fact, there is no comparison either in colour or detail. Unfortunately, however, if development is prolonged by slight under-exposure, or if the developer is old, most of the prints will show a deep stain round the edges, no matter how carefully manipulated. This means that to print without this stain a full exposure and a very quick developer must be employed, which is most undesirable, and gives a greenish-black tone far from artistic.

I do all my printing on bromide paper, for convenience and permanency, and I have made many experiments with a view to removing the stain referred to. At page 52, vol. x., an ammonia bath was given, which I found answered very well, but there are some stains it will not remove. I noticed lately in an American annual that a professional had employed cyanide of potassium for clearing prints. No proportions were given, but after several trials I have found the following formula act to perfection.

Make a stock solution as under:—

Cyanide of potassium	$\frac{1}{2}$ oz. avoird.
Water (distilled or boiled rain) ..	10 ozs.

(Keep this in a stoppered bottle under lock and key, clearly marked *Poison*.)

When required for use, take $\frac{1}{2}$ drachm stock solution, and add 2 drachms of water. Take a pinch of iodine between finger and thumb, and drop it into the cyanide. Stir until the cyanide has taken up all the iodine. *None must be left undissolved.*

Remove each print in turn from the washing water (they should be washed thirty minutes after fixing), place it on a clean glass plate, let it drain, and then hold the plate level in the left hand. Make a small and rather pointed plug of cotton wool,

and moistening it in the cyanide solution, go carefully round the margin of print, avoiding the picture, of course, and you will be surprised at the result. The stain is cut away as you proceed, leaving the paper snowy white. After treatment the prints must be well washed for another half hour in running water. The use of the cyanide does not end here. If your prints are over-developed, or have the whites impure, dilute the rest of the cyanide solution with four times its bulk of water. Immerse the prints, watch closely, and when clear plunge into cold water at once. The effect is wonderful. With this means of clearing the prints, slow development and old solution can be used without fear. While on the subject of bromides it may be interesting to some to know that by giving Ilford slow paper a rather full exposure, and using a weak hydroquinone developer, a result is attained which it is not easy to distinguish from platinotypes. But do not add bromide to your developer, as it gives harsh contrasts and kills detail.

Those who use Eastman's paper will experience a greenish image at times. This is turned to a rich blue-black in less than a minute by immersing in—

Sulphocyanide of ammonium	30 grs.
Water	4 ozs.
Chloride of gold	1 gr.

In fact, I always tone Eastman's paper in this solution to obtain a rich image. Be careful not to leave the prints in this solution after they assume a blue-grey appearance, or they will rapidly become deep blue, which, by the way, can be noted as giving exquisite moonlight effects.—I am, etc.,

H. W. B. BRUNO (Captain, O.S.D.)

St. Helena, May 19th, 1890.

* * * *

ACID FIXING BATH.

SIR,—In the current number of the *English Mechanic* attention is drawn to the merits of a new compound, "a solution of sodium acid sulphite," as an addition to the fixing bath. Some plates "fix in about one-fourth of the amount of time ordinarily taken," and "are remarkably clean and free from stain."

We have always been told by chemists that acidity in the hypo bath decomposes it, and sets free a sulphurous compound inimical to the permanence of the negative. Who is right?

FRED DAVIS.

The Complete Photographer ;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

By H. P. ROBINSON.

CHAPTER XII.

What is Photography?—Photography in Colours.—A Late Craze.

PHOTOGRAPHER.—I have endeavoured to guide you along the firm ground that leads across the morass of technical photography until you are ready to pass the threshold of the Promised Land of Art. It is a crowded path at the beginning, but not many reach the goal. Will-o'-th'-wisps flick their delusive little candles on all sides to laugh at one victim as he is swamped in new developers, at another at being entrapped with a new shutter. Others stay to play with toys. If you wish to reach the land of art you must escape from the seductions of science. You must stop your ears, as Ulysses did, to the Sirens. You must not listen to the fascinations of the red end of the spectrum and its potentialities; you must have no desire for the estimation of the differentiation of gradation through the altered synchronism of the atoms of pyrogallol. Instead of being enchanted with the power of measuring the speed of a shutter, you must be satisfied with the commonplace fact that it moves at a pace that gives you the exposure you desire. You must make pictures, not play with the tools.

PUPIL.—Photography has been called the Art-science, but I gather from your teaching that it is neither science nor Art?

PHOTOGRAPHER.—You are right. It is the result of one and the means of the other. On the one side are chemistry and optics, to say nothing of carpentry and cabinet making; on the other is art. But photography is a thing by itself. Our processes have grown out of chemistry, and it is hoped are being recognised as a means of art; and as a man may be a perfect painter without being an artist, and an artist without being a painter or sculptor, so without any knowledge of chemistry or art you may be a COMPLETE PHOTOGRAPHER. It is that I have endeavoured to make you; it is now for you, if you want to go further, to "learn the why and how to apply."

PUPIL.—And how am I to learn this before and after?

PHOTOGRAPHER.—The science you may get from Captain Abney's books, and may I be permitted to say that the way to Art as adapted to photography you will find in several of the little books I have published.

PUPIL.—You would prefer, however, that I did not give much time to science at present.

PHOTOGRAPHER.—I mean to say that you should learn to walk before you try to run. I am partly of the opinion of Pope, that "one science only does one genius fit," and am certain it is not necessary to become a chemist in the pursuit of art, and it is well to remain true to an old process until it is proved to be inferior to a new one. There can be no real progress when the mind is frittered away on so many subjects.

PUPIL.—But does not this conservatism stop all progress?

PHOTOGRAPHER.—It depends on the direction you are going. It may not conduce towards the progress of science, but that is not the business of the artist, and it gives him more time to study art. It is necessary only for the artist to judge of effects; he does not want to know causes. "Theirs not to reason why." It is the quality that should interest him, and the faithfulness to nature of the photographic image.

PUPIL.—You have gone through all the processes it is necessary for a complete photographer to know, but I fail to feel complete until I know how to photograph in colours. Can you tell me?

PHOTOGRAPHER.—A modest request meant to pose me, but I can reply to the letter if not the spirit. You may easily photograph colours; I have done it myself, and so have many others; it is, in fact, one of the oldest processes known. Many years ago (1866) I made some experiments under the direction of the late G. Wharton Simpson which showed that coloured light would give a coloured image. It is an easy experiment which any amateur could make, and thus enable him for ever after to say he had made photographs in colours. Here it is.

It was well known that in nearly every instance in which the natural colours had been secured, the sensitive surface employed was the violet sub-chloride of silver, often obtained by complicated and troublesome means on a plate of silver. It occurred to Mr. Simpson that his own collodio-chloride of silver would be a convenient agent for producing the violet chloride. I made many experiments for him, of which the following was the most successful.

A collodio-chloride emulsion was prepared consisting of 1 ounce of plain collodion, 2 grains of chloride of strontium, and 5 grains of nitrate of silver. A plate of opal glass was coated with this, dried before a fire, and exposed to diffused daylight until it assumed a deep lavender grey, or slate colour. Several pieces of coloured glass were then laid on the surface, and the whole placed in sunlight for several hours. The coloured glasses were bits we happened

to have by us. Deep ruby, bright-orange, red, and a piece of clear patent plate, on the end of which was poured a concentrated solution of aniline red, and on the other end aniline green, a piece of clear glass being between the two coloured ends. At the end of some hours' sunlight exposure we were surprised and delighted to find vivid indications of each colour in its true relation. Under the ruby glass the tint was of a bright claret; under the orange, a rather redder orange than the glass itself; under the aniline red, the tint graduated from orange to a deep purple according to the thickness of colour; under the green a graduated green. Under the clear glass we met with the most singular part of the case. The uncovered portions of the film submitted to the uninterrupted action of the light had darkened to a bronze black in the usual way, but the portion covered by the bare glass was bleached to a yellowish white, and on examining the glass carefully by placing it on a sheet of white paper, we found the glass slightly tinged with yellow, as was usual with the Belgian plate glass of the day. Here was a film of chloride of silver which, having been submitted to the action of light until it was of a deep warm grey colour, was bleached to a yellowish-white by the continued action of light through a piece of yellowish-white glass, while the portions of the same acted upon by the same light uncovered, printed to a deep bronze black.

PUPIL.—That was a strange experiment.

PHOTOGRAPHER.—Yes, and it is so simple that it is within everybody's means to try it. Is there anything else you want to know?

PUPIL.—At one of our early meetings you promised to tell me something of naturalistic photography, which was at that time so much in evidence.

PHOTOGRAPHER.—That is so long ago that the subject has got stale. Naturalistic photography may be now taken as a "negligeable quantity." The good of it will be absorbed into serious art, and the sound and fury which signifies nothing, not finding a congenial home here, has crossed the Atlantic and blown itself out in fitful gusts in America. The violent agitation did good in this way. It has been pointed out for many years by those who practised photography as an art that nature to the eye was not quite so sharp as shown by a corrected lens, and the naturalistic, by pointing out this difference of focus and exaggerating the real facts—in their writings, not their pictures, mind you, they were not so far gone as that—gave the thing increased prominence. The mistake they made was in the use of such intemperate language to condemn everybody and everything else that was not to their own way of thinking. In fact, it was a case, if not of temper, then certainly of temperament. Many a cause has been lost from a like frailty, but nothing could have saved naturalism as set forth.

PUPIL.—Why?

PHOTOGRAPHER.—Because, for one thing, they did not teach by example, for another it was first advocated by a writer who was not sufficiently endowed with temperate language to forward any cause; next it does not adapt itself to the genius of photography; and then it was not true.

PUPIL.—Weighty reasons. Can you explain them a little further?

PHOTOGRAPHER.—First its exponents do not teach by example. Unfortunately for the value of some teaching, it happens that a few of those writers in art who are also photographers—they are not many—preach one theory and follow another in practice. No theory could have been more violently advocated than the naturalistic, yet I still want to see a photograph produced strictly according to this theory. I have seen nearly all that the naturalistics have exhibited up to the present time, but nothing that could be said to distinctively agree with their theory, and, above all, most of

their negatives are as sharp as they can be made, and I don't wonder at it. When the subject is good and the light right, the wind lulled, and you are far from home, with no prospect of another chance, it must demand more than mortal courage to deliberately put your image out of focus.

PUPIL.—Then as to it not harmonising with the genius of photography?

PHOTOGRAPHER.—To wilfully neglect definition is to give up one of the strong points, the speciality if I may so say, of photography. Although I would not carry definition to excess, yet to give it up is to sacrifice a characteristic power. I have always held this opinion, and often find support in writers on other branches of art. In a capital article on Etching, in a late number of the *Art Weekly*, a paper which cannot be accused of unkindness to the naturalistics, I find this sentence, "Every medium of art expression has some field in which it is *most* at home; something it can do best; oil no less than water-colour; fresco as well as pastils. All that ought to be asked of each, or all, is that they shall not painfully stretch their powers, and that they shall not imitate some other medium." The writer further says, "Everyone of the reproductive arts has its *forte*, beyond which it ought to be allowed to stray in a liberal radius, with due reason given in the exigencies of the subject. When one of them apes another and wastes itself in a vain display of curious dexterity, then there is room for the critic to plant his foot, and to guide and restrain, and even to crush."

PUPIL.—A capital quotation and to the point. You had another objection, I think—you said it was not true.

PHOTOGRAPHER.—Did any healthy pair of eyes ever see anything out of focus in nature? Show me that curious phenomenon, and I promise to be converted at once. It is even more difficult to lay hold of than a Will-o'-th-wisp. You can see the phosphorescent flame of the Jack-o'-lantern if you cannot catch it, but astigmatism jumps away so quickly that you cannot get even a glimpse of it. This is putting the whole affair into a nutshell. If the naturalistics will show me directly and without quibbling how to see any object out of focus in nature I will worship at their shrine. In the meantime, if you should find that you are seeing double, you should consult an oculist or join the Blue Ribbon army.

PUPIL.—Well! thank you for your guidance through the realms of nothing new. Good-bye.

PHOTOGRAPHER.—Good-bye, hoping to see you again, when you can show me to what good use you have put the common-sense I have endeavoured to instil into you.

THE END.

PHOTOGRAM, NOT PHOTOGRAPH.—Mr. B. N. Lobb, of Bristol, writes:—"Let me suggest that the first term, 'photogram,' should be always used when a picture that *has been formed* by the action of light is meant, and 'photograph' when you use it as a present indicative or infinitive."

MR. BROWNLOW, of the Metropolitan Hospital, Kingsland Road, E., has recently made a new shutter (patent applied for), which is somewhat novel in form, and capable of giving very short exposures. There are two forms of it, one for use between the lenses, and the other before or behind the lens, and, of course, the one working between the lenses is preferable for the shorter exposures. The shutter consists of two pairs of metal screens opening from and closing to the centre, and on releasing the shutter for exposure, the first pair of screens opens, and immediately on the full aperture being attained, the second pair commences to close. The action is very smooth and almost noiseless, and there is no vibration. It is also arranged to give time exposures if desired. The whole is very light, of comparatively small dimensions, and the price is reasonable, varying from 14s. to 25s.

The Stereoscope.—IV.

BY VALENTINE BLANCHARD.

HAVING traced the stereoscope from its birth to its full growth and final decay, we will proceed to the more practical part of the subject; and here it becomes necessary to deal with principles which, perhaps, by many may be regarded as so well known as to scarcely need recording; but when it is remembered that speculations on stereoscopic vision had been indulged in by various philosophers, from Euclid downwards, through a period of thousands of years, and yet it was only in the present century that Wheatstone made the whole matter clear, it scarcely needs an apology for putting the whole matter in the simplest form possible.

A diagram or two will be needed later on, but as much as possible they will be dispensed with. It has been said by many that we get quite a stereoscopic effect when we look at a photograph through a large magnifying glass. Now, true stereoscopic relief can never be attained by this process, but as the light and shade in the picture looked at has all the truth and reality of the original subject, the mind through the eyes is only too ready to be deceived, and the moment one is closed, and the magnified subject is looked at with the other, a certain amount of deception takes place, but only a certain amount, for as two eyes are necessary to see things in solid relief, the moment the other eye is brought to bear on the subject, it declares to the mind that there is only a plain surface before it, and on this plain surface a resemblance of nature.

Leonardo da Vinci was very near the mark in his speculations on vision, and remarked that as two eyes were necessary to see the various distances in a landscape correctly, so no painter could ever hope, with all the skill at his command, to deceive them in any rendering of such scene on canvass, and that only by looking at the picture with one eye could any such deception take place. The whole question of stereoscopic vision (Gr., *stereos*, solid, and *skopein*, to see) turns on the fact that each eye sees its own picture, and that these two pictures differ very materially in their perspective, more particularly in the near objects, but that these two pictures are merged into one instantaneously in the final impression sent to the brain to be recorded there. There has been much speculation as to whether the two pictures are not alternately flashed there with great rapidity—with such rapidity, in fact, that they give the impression of one image only; but we do not feel it necessary to go further into this matter here.

Each eye sees more of the side of a solid object nearest to it. This can be illustrated in a variety of ways. For example, try the following as readiest to hand. Place the thumb against the nose, and flatten the hand as much as possible. I know this will be regarded as vulgar by some, for the operation is called by very vulgar little boys "taking a sight at him." And, therefore, it had better be done in private. Having got the hand—with no one in front of it, of course—in proper or improper position, close the left eye. If the right hand be employed, the back of the hand will be seen, though of course only the edge of the hand is offered to the two eyes. Now close the right eye and open the left. Immediately the back of the hand will disappear, and the palm of the hand only will become visible. Now, rapidly open first one eye, then the other, when it will be seen that the hand appears to jump from left to right alternately. For instance, when the right eye is closed, the hand will go to the right, and when the left is closed it will jump to the left. When both eyes are open, the hand takes a position midway between the two jumps, and both sides—both palm and back—are visible. Of course, it may be necessary with some sights to advance the hand from the

nose in order to see clearly, but the nearer the hand can conveniently be held to the nose the more striking will be the effect of the experiment.

Here is another illustration which still further emphasises the above. At the moment I write a lady is walking slowly in a street outside the window. The direction taken by her is to the right, across the field of view, and she is distant about forty yards. As she nears the right side of the view, bounded by the window frame, I close the left eye and she suddenly vanishes. The window frame has suddenly jumped to the left and swallowed her up.

The above illustrations show in an emphatic manner the importance of foreground objects, or those portions of the subject nearest to the eyes, in giving stereoscopic relief in a striking manner.

A little reflection will show that very distant objects do not show any perceptible change when looked at alternately with either eye. If the distance of the two eyes apart be roughly taken at $2\frac{1}{2}$ inches—the extreme limit may be stated as 3 inches—and both eyes be directed at some very distant object—say, a ship at sea, two miles away, and there is another ship in the same vertical line on the extreme horizon—no change in position of the nearest ship will be apparent when looked at alternately by the right and left eye; but if another ship, or any other object, occupy the same vertical line, but only a few yards distant, then the position of the near object in relation to the distant ones will materially change in accordance with the change of angle between the right and left eye, depending, of course, upon whichever eye is employed in looking at the view in question.

The relative strength of the two eyes is, of course, an important factor in these considerations; and in all experiments it is assumed that both eyes are fairly good and of the same focal length; though, as a matter of fact, in most persons one eye is stronger than the other; still, if there is no striking difference, the eyes are so adaptable, and, therefore, convey the correct impression to the brain, that they may be regarded as sufficient for most optical experiments.

The importance of both eyes in giving solidity to objects looked at, and so enabling various distances to be correctly judged, will perhaps be best shown by some experiments with one eye only.

Here is one, undertaken a short time ago by the writer in order to convince a painter of some eminence that it was impossible with one eye only to estimate the distance of unfamiliar objects apart when placed one behind the other. He was told to close one eye, and then put out the hand and touch the mantelpiece some little distance away. He had to extend the hand further than he expected; in fact, he had to feel for the object. Still, he was not quite convinced, and a more severe test was now applied. He was told to close the eyes until requested to open them. During the temporary blindness a series of objects were arranged on the table at varying distances behind each other, and he was placed in a low chair so that the eyes were about level with the objects in question. On being told to open one eye, and without reflection or hesitation to extend his hand and take up one of the objects in the middle of the improvised group, he failed completely, for his hand did not go within several inches of the object sought for. No further experiment was needed to convince him of the truth of the statement, but he was so surprised at the result that he made several more to satisfy himself that the failure was not the result of accident.

Of course, the memory of the form and relative size of objects must aid those who are unfortunate enough to have only one eye to help them through life. There can be

no doubt, however, that if some one were suddenly deprived of the use of one eye, were compelled to move about and do various things by the aid of the remaining eye only, before he had got use to the new condition of things involved in the loss, he would probably knock against various objects in his path and upset others. Nature, however, speedily helps him, and by more intense observation and more acute training of the remaining eye, he manages to get along fairly well; but never can he again see objects in real relief, and the wonders of the stereoscope are lost to him for ever. The best illustration of the importance of both eyes in order to judge distance is given in one of the works on the subject, but which one the writer cannot remember at the present moment: Suspend a large curtain ring, and arrange it so that only the edge is visible. Now place the experimenter a short distance away and exactly opposite to it. Let him take a hooked stick and reach it forward and try without hesitation to put the hook into the ring. If there is any betting going on, bet against his success if you want to win. In this experiment there is no previous memory, and as only the narrow edge is offered to him there is nothing to help him, and the chances are therefore very much against his success.

(To be continued.)

Eikonogen for Bromide Paper.

BY GREENWOOD PIM.

EIKONOGEN as a developer for negatives seems to have found comparatively little favour in Great Britain, chiefly on account of the difficulty in obtaining sufficient density, whilst in Germany it is apparently used to a considerable extent. Its use with bromide paper appears—if we may judge from the journals—to be almost unknown over here, although it is, I believe, adopted a good deal in America. As it is a very satisfactory and economical developer, I would ask permission to draw attention to it. In the *American Annual* for 1890 I saw a formula quoted which I tried satisfactorily; it was as follows:—

A.				
Eikonogen	..	..	..	16 grs.
Sodic sulphite	..	..	..	32 „
Water	..	..	..	1 oz.

B.				
Potassic carbonate	..	..	..	168 grs.
Water	..	..	..	1 oz.

Take of A 6 fluid drms., B 20 minims, water 2 fluid drms.

To avoid odd grains, I use what are practically the same proportions, with good results, viz.—

A.				
Eikonogen	..	..	..	2 drms.
Sodic sulphite	..	..	..	4 „
Water	..	..	..	8 ozs.

B.				
Potassic carbonate	..	..	..	4 drms.
Water	..	..	..	1½ oz.

The writer in the *Annual* suggests that this strength might be materially reduced. So it may, but the colour of the resulting print suffers—at least, that is my experience.

One of its great advantages over ferrous oxalate is that there is no danger of the inky stain the slightest trace of hypo produces, and which with all one's care will sometimes get on a finger, and ruin an otherwise excellent print. The danger of discolouring the high lights is much less than with hydroquinone—in fact, except at the extreme edge it is almost nil.

It is not an expensive developer, as one drachm of eikonogen, costing under twopence, will develop six 12 by 10 pieces of paper. A bottle of eikonogen containing a little over three ounces, costs three shillings; and the mixed solution can be used two or three times in succession, with a little strengthening. Moreover, the solutions keep fairly well for two or three weeks, even in an uncorked bottle.

The enclosed scrap, which was only a trial print, gives a fair idea of the colour, on which I would like your opinion.

It is not quite so suitable as oxalate for ghostly negatives, as it gives somewhat softer prints, hence it is better adapted to fairly good dense ones.

Our Contemporaries at Home and Abroad.

The *Photographic Times* (New York), speaking of "Toning Prints in Hard Water," says, "The finished prints are rough to the tongue, and when dry are covered with a mealy deposit that cannot be rubbed off. There are two or three ways of getting rid of the nuisance. One is to add milk of lime to the water, before washing the prints, just enough to soften it. The great danger is in adding too much. The exact amount can only be ascertained by experiment. Generally an ounce or so to the bucket is sufficient. It must be added a few hours before using the water, so as to give it time to settle. Another and better way is to wash, tone, and fix as usual, paying no attention whatever to the deposit on the prints till nearly ready to mount. Then immerse them, a few at a time, in a weak acid solution, say one drachm of muriatic acid to half a gallon of water. Let them remain in the acid solution till they are slick to the tongue. It will only require a few minutes. If a great many prints are to be cleaned, the strength of the acid bath must be maintained. The only objection to the acid bath is its tendency to cause blisters, especially if used a little too strong. But better lose a few prints by blisters than the whole batch with the white deposit of, shall I say, lime? But the best and most satisfactory remedy is to soften the water with ammonia before washing and toning. The exact amount required can only be ascertained by experiment. Two drachms of the stronger water of ammonia to the gallon is sufficient here. It should be added a few hours beforehand to give it time to settle." Articles: "The New Tariff Bill," "The Origins and Progresses of Photo-Engraving," "The Optical Lantern," etc.

The *Photographer* (Cincinnati), speaking of the New Tariff Bill, says: "Some time ago the announcement was made in these columns that an increase of 6 dols. a ream duty would be imposed on albumen paper if the proposed new tariff bill was passed. The tariff on albumen paper is now 15 per cent.; the new bill makes it 35 per cent.; and thus importers will be obliged to pay about 6 dols. more a ream for the paper, and will, of course, be compelled to charge photographers proportionately more for the paper when selling it to them. Photographers, however, will find it difficult, owing to the competition in their business, to transfer the tax to their customers. They would have to pay 6 dols. a ream more for their paper, yet furnish photographs at or very near the old prices. Do photographers clearly understand this? If so, we are sure they will unite in the effort which is now being made to defeat this proposed increase of duty on albumenised paper from 15 to 35 per cent." Articles: "Photography in Colours," "Manipulation in Flash-light Photography," "Retouching," etc.

The *Practical Photographer* has an interesting article on Mr. Jay Haynes' travelling studio car on the Northern Pacific Railway. The other articles are "Photography as a Business," "Nature and Art," "Photographic Enlarging," "Lighting Old Faces," etc. It has a good process reproduction of "A Portrait Study."

The *Naturalists' Record* has the first of a series of letters by the Rev. F. C. Lambert, on "How to Teach Ourselves Photography," as well as an article on "Photographs of Lightning and Meteorological Phenomena," which is illustrated with three good autotype reproductions of lighting flashes.

The *Photographic Art Journal* contains two process block re-

productions of photographs of "The Old Manor House, Chenies," and "St. Cross, Winchester," by Mr. Bernard Alfieri, both of which suffer considerably from the fact that the tops of the trees are cut off, and in one, at least, unnecessarily. There are articles on "The Photographic Salon, Vienna," "The Latent Photographic Image," "Mr. Edwards-Ficken on Rules and Effects of Lighting," "Gelatino-Chloride Emulsion Papers," "Carbon Printing," etc.

The *American Amateur Photographer*, in an article on "Women's Work," by Catherine Weed Barnes, says, "Women are, when interested in an occupation, conscientious and painstaking workers as a general thing, and neat ones, very useful qualities in the laboratory; but the first should not be allowed to miss the audacity of inspiration, and the last should not degenerate into the pettiness of unnecessary labour. Let your brains save your hands; do not be afraid of work, but save your strength for where it will do you the most credit. Studio work is physically, as well as mentally, *hard* work, and the camera-stand and backgrounds should move smoothly and easily, while every appliance should be so arranged as to avoid over-exertion, for a tired woman, like a tired man, does poor work, and the irritated nerves if pressed too far are apt to get the upper hand of one. When your fingers begin to work clumsily, when everything seems inclined to be at cross-purposes, and you are apt to drop whatever you take up, stop right where you are and rest until your mental horizon begins to brighten. Otherwise what is done under such a shadow will not advance your photographic reputation. Go at your studio work with freshly rested nerves, and do it always, if possible, in the morning. The results will be infinitely better than if you felt the necessity of constantly spurring up your exhausted energies to the working point." Articles: "A Trip to the Windward Islands, etc.," "Hand-Cameras," "The Silver Printing Bath," "Photo-Micrography," "Dry Plate Development," "About Developers," etc.

The *Camera*, speaking of the Photographic Convention, says, "The art has progressed so marvellously during the fifty years of its existence that photography now essays to produce pictures, although, afraid apparently to assert too boldly a claim to the higher artistic qualities, these results are moderately styled 'picture-making.' There is yet another phase of the usefulness of photography which is calculated to enhance the estimation of its value in the scientific world, and this is its undoubted power for scientific illustration of several of the other departments of science, such as astronomy, meteorology, natural history, medicine, and micrography. In this connection photography has already been mainly instrumental in taking not a few subjects of popular belief out of the region of plausible conjecture, and placing them in the category of established fact." Articles: "Films and Film Using," "Lantern Slides," "Photographic Chemicals," "Mrs. Julia Cameron's Pictures at the Camera Club," "Suggested Regulations for Photographic Exhibitions," etc. There is a reproduction of a photograph of the interior of St. Wilfred's Catholic Church, York, which is very good, and of a portrait of Mr. C. H. Bothamley, F.I.C., F.C.S., which, however, does not do justice to the sitter.

The *Studio* (New York) contains two full-page illustrations, one of the "Rembrandt du Pecq," and the other of a terracotta group, "The Market Place." There are also a number of "Art Notes" of considerable interest.

WATKINS' EXPOSURE METER.—Mr. Watkins has sent us a block of his meter, and we are therefore able to give the accompanying illustration. He says, "I claim that not only is the combination of actinometer, calculating rings, and seconds pendulum a great convenience, but that I have investigated and separated the various factors in a much more thorough way than other inventors, the result being that the instrument is of the greatest service for every kind of daylight camera exposure, from cloud pictures to enlargements. Mine is the first system in which instructions are given to test the actual light falling upon the subject." A descriptive article will be found in the last issue of the *Photographic Societies' Reporter*.

Science Notes.

Of high importance is the paper read by Dr. Burdon Sanderson before the Royal Society on May 1st. The subject was "Photographic Determination of the Time-Relations of the Changes which take place in Muscle during the period of so-called Latent Stimulation." The point was to show how long a muscle takes to contract after an exciting influence has been applied to it. During the last forty years the question has been investigated by Helmholtz, Bernstein, and Du Bois Reymond, and it appeared that about the one-hundredth part of a second elapsed between excitation and contraction. By photography, however, Dr. Sanderson has been able to show that the interval is only the *four-hundredth* part of a second. His method consists in projecting the movement to be recorded, whether of the muscle or of any instrument which serves as an index of change, on a vertical slit on which the vibrations of a tuning-fork and the motion of a signal are also shadowed. Immediately behind the slit is a photographic plate, which is carried by an equilibrated pendulum. The approximately uniform rate of motion of the sensitive surface which receives the light-written record is about one metre per second, but is determined in each experiment by reference to the rate of vibration of a tuning-fork.

At the meeting of the Meteorological Society of Berlin on May 5th, Dr. Wagner announced that arrangements had been made for endeavouring to take *simultaneous* photographs of flashes of lightning at widely separated stations during the coming summer. It was hoped that by this means it would be possible to obtain some idea of the actual length and direction of each flash.

What next? We expect that the idea of silvering the back of a sheet of celluloid, so as to use it as a *looking-glass*, would have been a long time in occurring to most of our readers. But Mr. C. H. Koyl, of Euston, Pennsylvania, has patented a process which is said to effect this object perfectly. An advantage is that the reflectors so formed, being flexible, can be readily bent to any shape.

No wonder the Japanese are so rapidly and successfully progressing in photography. For centuries the "sun goddess" has been an object of adoration there, and her representative—the mirror of polished bronze—is still worshipped, especially by the female part of the community.

Professor Graham Bell—the inventor of the telephone—is experimenting with an instrument which he has named the *radio-phone*. He finds that light can produce *sound* when it falls upon certain substances, the best of which for this purpose appears to be *soot*. It is the heat rays which produce the sound chiefly.

The *English Mechanic* thinks that the recent great increase in the price of platinum is on account of the extensive use to which that metal is now put by the makers of electrical apparatus. Anyhow it is hard on the photographers that their most permanent and most artistic process should be handicapped by a rise in the price of platinum from thirty-two shillings to fifty-four shillings per ounce in the course of a few months.

We think that many metropolitan photographers will welcome the new handbook, "Rustic Walking Routes Within the Twelve-Mile Radius from Charing Cross," by Messrs. Evans and Sharpe. There is a field-path map of the district, and several charts. It is sold in four parts at one shilling each, and the publishers are George Philip and Sons, 32, Fleet Street.

The annual inspection of Greenwich Observatory took place on Saturday last. During the year 1889 photographs of the sun were taken on 212 days, which showed that the middle of that year was a well-defined *minimum* of sun-spots. The new telescope for astronomical photography has been completed, and an important addition to the staff has been made in the form of four ladies, who are to take and to measure the photographs for the international chart of the heavens. This is quite a new opening for ladies who have received a scientific education; and it has doubtless been sanctioned by Government with a view of testing the capabilities of the fair sex for office and scientific work.

I see that in my last week's *Notes* my reference to the strong smell of the Eastman rollable film is printed *colour* instead of *odour*. From the patent (since printed) I see that the odour is (as I surmised) due to amyl acetate.

F. G. S.

BELFAST Y.M.C.A. CAMERA CLUB.—On the 7th inst. the members took an outing to Ballycarry and Harne, where a number of interesting pictures were taken.

Hints on a Day's Jaunt to North Wales.

(By our Special Commissioner.)

LAST Saturday, at the request of the Editor of the *AMATEUR PHOTOGRAPHER*, I ran down into North Wales, accompanying 30 or 40 "camera men" hailing from the Liverpool Society. We had brilliant weather for the excursion, and, as events turned out, a splendid time. Let me reproduce my notes as they were hastily scribbled down on the ferry-boat, in the railway train, and strolling through the winding, avenue-like lanes with which Wales abounds.

We crossed the Mersey from Liverpool to Birkenhead on the Woodside ferry-boat, and took train to Chester. The railway station adjoins the ferry; trains run frequently to the Cestrian capital, and we lost little time. Arriving at Chester, we changed carriages for Rossett and Gresford, the latter village only nine miles from Chester, and but three miles from Wrexham, a rather ancient city of the principality, noted chiefly in the North of England for its fine ales. There is much more of interest at Rossett than at Gresford for the photographer. Gresford is the further station, but it is advantageous to make this the stopping-place, and then work back to Rossett, a path between the railway track and the river Allen, to the south, being the most picturesque and productive route. Alighting at Gresford, a contingent of our party immediately set to work on an old cottage immediately beneath the station. Built at the foot of the railway embankment, and almost buried in trees and foliage, except at the front, this cottage makes an excellent picture.

When we had again got on the march, we re-crossed the railway line, and ascended a hill on the left. Gresford church, a building dating from—as the inhabitants of the neighbourhood say—the fourteenth century, is at the summit, and offers good opportunities. In the churchyard (north-east corner) there is a very old yew-tree—a patriarch in every sense of the word. I made several careful inquiries about the age of this tree, and find, on referring to my notes, that on unimpeachable authority—so far as village tradition and folk-lore can be unimpeachable—it is from 1,400 to 2,000 years old. In any case, whether Munchausens abound in Gresford or not, the old yew is certainly very old, and, given the light in the right direction, is well worth a plate or two. The interior of the church also presents several nice subjects. Continuing our survey, after looking about, we choose, as I have indicated, the river path to Rossett. We strike down hill again, across the railway track, and soon get on the straight road. On the right we have the metals; on the left, green, beautiful meadows and pasture land, with their herds of cattle, flocks of sheep, and panorama of hills, woods, and dales. Overhead, yews and laburnums make a perfect avenue, until we reach Marford, a village where at least half-a-dozen good subjects may be secured. On the road we have just left there are really some very pretty bits, and the artistic chord in our party is strung to concert-pitch. The material is always here—the moving flocks and herds, the sun, and the green make pictures. We are busy in Marford for an hour at least, among old inhabitants, cottages, and quaint nooks and crannies, and then make a forward movement to the famous mills of Rossett. There are two of these mills. They are almost opposite each other on different sides of the road; but for all that, one is in Flintshire and the other in Denbighshire. The natives point this out with much pride, and with measured strides to show there is no deception. When I say that both mills are good subjects, I need hardly add that they are "done to death" by gentlemen of the brush and easel. Photographers are beginning to crowd round, too. The Flintshire mill is, perhaps, second to the Denbighshire mill as a picture, but it affords a farmyard subject which, taken in the morning is, I am told, very exceptional. There is a mill at Gresford, but somewhat off the track. For this reason it is not much "taken;" besides it is scarcely as good a subject as the mills at Rossett. The foregoing is merely a rough indication of where and how photographers in North Wales can put in a good day. "Wilderness Fall," in the locality, is much talked of, but a poor subject, and the same may be said for one or two other "sights" in the neighbourhood. The residents are obliging if approached politely, and will concern themselves in behalf of artists and photographers.

The walk from Gresford to Rossett is only about two miles—

perhaps a little over—and the road is a good one. The journey from Liverpool occupies about one and a half hours, and the probable cost of the out will be, at regular fares, say, seven or eight shillings. This will include a substantial tea at Chester. But, during the summer, cheap excursion tickets to Chester can be secured three or four days a week; after which the railway fare from Chester to Rossett or Gresford is trifling. The district is one much affected by "camera men" in the Liverpool district, as affording excellent facilities for an enjoyable and satisfactory jaunt. Companionship is nearly always certain.

The party from Liverpool last Saturday made about 220 exposures.

Notes from the Liverpool Centre.

(By our District Editor.)

A DAY too late to send for publication last week, Mr. F. Anyon, a prize winner at Hastings, exhibited in the Liverpool head-quarters a series of selected views. The series was a mixed one, embracing specimens of platinotype and silver printing. The silver papers in particular were really excellent; the tones were brilliant, and the definitions all that could be desired. Much of the secret of this exceptional success, it was felt, was due to the fact that Mr. Anyon takes the trouble to sensitise his own paper. Special inquiries were made as to this. The paper is floated in a 60 grain nitrate of silver bath for 2½ minutes, and then suspended by the corner till bone-dry. Placed between blotting paper, under pressure, it will keep for six days. Mr. Anyon's estimate is that the paper when sensitised has cost him 4½d. a sheet; paper per sheet, 3d.; silver, 1½d. = 4½d.

The ordinary meeting of the Birkenhead Photographic Association takes place on Thursday this week, when it is hoped to announce the award of the adjudicators in the annual out-door competition. Mr. J. A. Forrest is to give his paper, postponed, on "The Most Effective Means of Protecting the Sensitive Plate during Development." By the way, the prints sent in for the competition mentioned will be on view.

Mr. Lange sails for Iceland on the 26th inst. He is making most complete arrangements for the trip, and, as far as practicable, safeguarding against any accident to apparatus and plates, Mr. Geo. Thordahl, an Iclander and prime mover in the matter of the journey, is at present in Liverpool superintending the details. The *Myrtle*, the steam yacht which will convey the party, has been twice round the world, besides making other protracted voyages. She is 320 tons yacht measurement and 512 horse power. Her internal fittings and appointments are excellent.

The Wallasey Association held their ordinary meeting on the 4th inst., Mr. Kite in the chair. Mr. J. W. Gregg read a paper on and illustrated the preparation of sensitised paper. During the past few years, he said, photographers had recognised that ordinary photographs on albumenised papers were much improved by the use of platinotype, bromide, etc. He did not recommend home preparation of the two papers named, but he advocated the use of plain salted papers which could be worked up into tones resembling platinotype work, and could be used also for enlargements, to be afterwards worked up in colours or crayon. A practical demonstration in preparing the paper followed, Mr. Gregg exhibiting several very successful pictures, showing the results obtainable by the use of various sizing and salting solutions. Messrs. Wilkinson and Reader were elected delegates to the Chester Convention. Next meeting, July 2nd.

"PRACTICAL FLASH-LIGHT PHOTOGRAPHY," by Robert Slingsby (Marion and Co.), is a nicely got up, well-written, and well-illustrated book on the subject. It is very evident that Mr. Slingsby has thoroughly studied and experimented in this branch of the art, and the suggestions he makes are eminently "practical," and if thoroughly studied and carried out will enable the worker to get successful pictures by the flash-light. The illustrations are from negatives made by the writer, and are most successful, and two are decidedly "practical." One shows a sitter and the arrangement of the screens and flash-lamps, and the other the picture of the sitter secured by means of the lamps shown in the first. Generally speaking, the book deserves reading.

Holiday Resorts and Photographic Haunts.

ILKLEY AND WHARFEDALE.

By R. S. P.

THE little town of Ilkley, in the West Riding of Yorkshire, may justly lay claim to a place in your columns, under the head of "Holiday Resorts and Photographic Haunts," and lovers of the "beautiful art" will find few spots within the county of broad acres where nature has dealt with a more lavish hand than the charming valley of the Wharfe.

Sixteen miles from Leeds, fourteen from Bradford, and nine from Skipton, Ilkley may be said to be conveniently situated for the tourist, and is well served by the North-Eastern and Midland systems, while it may also be mentioned that Harrogate, with its celebrated waters, is within half-an-hour's run.

Ilkley, be it known, is a health as well as pleasure resort, and should the visitor, weary and fagged with the "daily round," care to go in for the water cure, he can have his wish gratified by entrusting himself to the tender mercies of the bathman at one of the hydropathic establishments, of which there are several, and there is no lack of hotels and boarding-houses. Plenty of conveyances are also at hand by which to reach the numerous places of interest with which the valley is studded—presuming, of course, that "Shanks's mare" is not to be trotted out. But this reminds me that I must not lose sight of the object with which I set out—namely, to point out a few of the prominent features for the camera.

In Ilkley itself a few "tit-bits" may be found; but the beauty of the place has unfortunately been marred by the hideous railway embankment through the heart of the town, and the viaduct spanning the principal street.

The tourist, or visitor—as he cares to be described—may pay a visit to the parish church, where are three obelisks or crosses, said by antiquarians to date from A.D. 625. A visit may also be paid to St. Margaret's Church, built in 1879 from the designs of Mr. R. Norman Shaw, R.A., and in his usual quaint style. A large residence hard by, by the same architect, is also worth inspection.

Above the town, and at the foot of the heather-clad mountains, richly studded with bracken and fern, is a miniature lake, called "The Tarn," and a stiff pull further along the edge of the moor brings us to what is called the Cow and Calf Rocks, from which prominence may be had a glorious view of the valley and surrounding country. Below is the well-known Ben Rhydding hydropathic establishment, and, lower still, the river Wharfe. On the opposite side of the valley is Denton Hall, the birthplace of the great General Fairfax. Down the valley to the east, occasional glimpses may be had of the river, whose winding course is gradually lost to sight in the distance. Behind us is the open moor, and by taking a path to the south-west, we reach the Rocky Valley, formed by rugged rocks, covered with ferns and mosses; and further on is a pretty waterfall. Here also may be seen numerous heaps of stones, said to have been used as altars at some remote date.

We will now take our course up the valley, and leaving Ilkley behind us, journey on towards Addingham, and, as we pass along lovely country lanes we may obtain at various points charming views of the river and its wooded banks. Leaving Addingham, we soon arrive at Bolton Bridge, and here it may be mentioned is a capital hostelry, the "Devonshire Arms," which affords good accommodation. A short walk now brings us to the "lion" of the district, Bolton Abbey, a grand old ruin, finely situated, with its lovely surroundings of river and wood. Close by the Abbey is "The Lodge," used as a shooting-box by the Duke of Devonshire, the owner of the estate, and here also may be seen the memorial cross and fountain to the late Sir Frederick Cavendish.

Continuing up-stream, we soon reach Bolton Woods and "The Strid," a narrow rocky passage or channel through which the river rushes with a deafening roar; on each side are high rocks and boulders flanked by richly wooded banks.

The views of the river from here to Barden Tower—an ancient ruin—are well worth seeing; indeed, if the tourist cares to continue his ramble further, he will find an ever-changing variety of scene, and I may casually mention Simon's Seat, Troller's

Gill, Stump Cross Caverns, Burnsall, Linton, and Kilnsey Crag as well worth inspection, while the upper reaches of the river abound on every hand with scenery of unsurpassing beauty. Having gone so far afield, we may as well visit Kettlewell and Grassington, where at both places good accommodation may be had.

Having traced the river almost to its source, we will now return to Ilkley, and I will endeavour to point out a few of the many places of interest down-stream, for it is impossible to include *all* in so short an article. Mention, however, may be made of the model village of Burley-in-Wharfedale. Here are the noted Greenholme Mills, in which the late Mr. W. E. Forster was partner, the deceased statesman's residence, hard by, being worth a peep. Further on, on the north side of the river, is Weston Hall, a charming old place, formerly the seat of the Vavasours; and a short walk brings us to Otley, the metropolis of the dale. Farnley Hall, the seat of the Fawkes, with its unrivalled collection of Turner's paintings and Cromwellian relics, is a prominent feature of the landscape on the northern side of the valley, while on the opposite stands out prominently Otley Chevin, a mountainous ridge nearly 1,000 feet above the sea.

Here I must make my bow, but before doing so let me not forget to mention the Washburn Valley, from which the neighbouring town of Leeds draws part of its water supply. Here a day may be agreeably spent in viewing the many charming bits between Leathley and Fewston.

* * * *

BRIDPORT (DORSET).

By G. C. T.

Any amateur in want of a quiet seaside place to spend his holidays in cannot do better than go to Bridport. It makes a capital centre for photographic purposes, as the surrounding neighbourhood teems with subjects. Bridport, situated near the sea, is a country town in a very hilly district. In the following short tours I will endeavour to point out the chief places of photographic interest.

(1) Leaving Bridport, go straight to Charmouth, a small village four miles west of Bridport. Here the church, and close by the house in which Charles II. hid, with several cottages, make fairly good subjects. Passing on through a cutting in the hill-side, a splendid view of Lyme Regis can be had with a long-distance lens. Following the road for about one and half miles, we come to Lyme Regis, where several plates can be exposed. The Cob (a pier), and a view of the harbour, should be taken, as well as parts of the town. If the tourist has time, I would advise him to go on for about seven miles to the "Landslip," where some good scenery is to be seen. Not very far from there, there is a fine water mill, with a rustic bridge in the foreground, which is well worth a couple of plates.

(2) Go straight down to West Bay (one and a half miles); here two photographs can be taken of the pier and harbour. Then proceed east to Burton, where, after having passed through the town, two beautiful cottages are to be seen at the junction of the Abbotsbury road and the road leading to the sea. The church, with several other cottages, should be taken before returning to Bridport. I would next advise the photographer to go to Chiddock, where a beautiful little church is to be taken in a morning light, as well as several rustic cottages.

(3) This tour, if such it might be called, should be devoted to Eyp (two miles from Bridport), and Bridport itself. At Eyp there are a few fishermen's cottages. In Bridport the outside of the church (St. Marie's) is well worth a plate; only a wide-angle lens is required. The interior and the pulpit also make very good subjects. From the top of Allington Hill a good view can be had of the town of Bridport at about 4 p.m. Besides these places, Weybridge with Portland Prison, the training ship, and Melcombe, can be easily reached by train. Abbotsbury Swannery (the largest in England), with the ruined chapel on a neighbouring hill, should be visited.

MESSRS. A. M. GEERING, of 15, Vartry Road, Stamford Hill, have sent us some specimens of their sensitised paper. In the short time at our disposal we have printed from fair negatives on the paper, and toned it with both acetate and soda and borax baths. In both cases the results appear the same as that to be got on good commercial paper. It is claimed that the paper is not affected by sea-air, and will keep good for twelve months.

Register of Dark-Rooms, 1890.

THE following "Dark-Rooms" have been placed at our disposal. We class them in four divisions, *i.e.*, *a* amateur, *d* dealer or professional, *h* hotel, and *s* photographic society.

In our letter of introduction full particulars are given as to owner, address, charges (if any); plates, chemicals, etc., kept by dealers; terms for temporary membership of societies; hotels; distance from station, etc., etc.

Every application for letter of introduction must be accompanied by SIX PENNY STAMPS. The owner of "Dark-Room" will be advised by same post as the applicant. The envelopes should bear the endorsement DARK-ROOMS.

NOTE.—*a* amateur; *d* dealer or professional; *h* hotel; *s* society.

THE "Art and Practice of Interior Photography," by F. W. Mills, is an expansion of a lecture intended to have been read before the Huddersfield Photographic Society, and is illustrated by prints from the writer's negatives. The subject is treated exhaustively and clearly by one well acquainted with it. The writer begins with a description of the apparatus best fitted for interior photography, and then goes on to deal with exposure with a table of average exposures, and also figures giving graphically an idea of the actinic power of light after passing respectively through blue, green, yellow, and ruby glass. In the chapter on orthochromatic work various formulæ are given for making plates orthochromatic. Other chapters follow on development, fog, etc., printing on paper and fabrics, platinotype, autotype, mounting, etc. The book is well worthy the perusal of those who intend to practice interior photography.

Exhibitions.

EXHIBITION OF PHOTOGRAPHS AT HEXHAM.

PERHAPS the most remarkable "one-man" exhibition ever held has been on view in the Town Hall of the quaint old market-town of Hexham (commonly known as the heart of all England).

The show consists of over 400 photographs of Northumbrian scenery and antiquities, ranging from whole-plate to 15 by 12, mostly printed by the platinum process, which in Mr. Gibson's hands lends itself most admirably to artistic effect.

Mr. Gibson is an ardent antiquarian, whilst as a landscape photographer he has stood in the front rank for many years. This being said, it seems unnecessary to state that the standard of the exhibition is high, and that the work shows evidence of thought and tender care throughout.

The technique, as might be expected from such a careful worker, is thoroughly good, except in a few of the architectural subjects in which the effect of the harmless (?) necessary wide-angle lens is somewhat unpleasantly manifest.

While some of the subjects possess only a local and archæological interest, they are treated in the same careful, artistic manner as his well-known landscapes.

Entering the Town Hall, we find photographs illustrating Northumbrian architecture from prehistoric down to modern times, instantaneous street scenes, views of black moorland and of the sylvan and romantic scenery of the Tyne and its tributaries, which Mr. Gibson has made peculiarly his own.

With so many pictures on view by such an acknowledged master in our art, it would be difficult to attempt a lengthened detailed criticism, but we propose to single out a few for special comment. The 15 by 12 first claim our attention, and a long way ahead stands No. 269, "Autumn Haze," a charming view on the South Tyne, with the distance beautifully softened by perfectly rendered haze. Another feature is a choice bit of foreground of reeds and rocks, with figures judiciously introduced. Coming next is 267, "Under the Haycock, Fast Asleep," in which the foliage in the middle distance is exceptionally fine, and the figures from which the picture takes its title are placed naturally and without any straining after effect. In No. 268, "September," we have a reach on the South Tyne (beautifully treated), a piece of pure landscape art, with gleams of sunshine playing on the water at the bend of the stream, and a gnarled old oak standing out in bold relief.

Coming to the whole-plate series, the task of selection becomes much more difficult. Our own feeling is that No. 82, "At Ladle Wells," is the choicest and most artistic pure landscape in the whole exhibition. It represents, with startling realism, a desolate, barren moorland; rushes and burnt heather make up the foreground; two trees, bare and bleak as the surrounding heather, stand out weirdly against the wintry sky, the whole forming the finest and, withal, simplest picture we have ever seen.

No. 36, "By the Brooklet," is of its kind a gem, which shows how a simple subject may be aided by artistic feeling in placing figures as aids to the composition.

No. 65, "Out for a Holiday," an otherwise fine work, is slightly marred by too much white road, which exercises a somewhat disturbing effect.

In No. 69, "The Beautiful River," the subject does not belie the title; a splendidly balanced picture, with most artistic foreground. No. 159, "The Wind that Stirs the Mere," is another scene of loneliness—a small Northumbrian lake. Here again the materials are simple—a crag and a sunlit expanse of water, broken up into ripples by the wind, with the foreground and sky, two of Mr. Gibson's strong points, alike admirably treated; so treated, indeed, as to make the picture.

Space does not admit of further individual notice, although many pictures merit it. In this category may be included 39, "Old Ridley Bridge;" 55, "Coastley Burnfoot;" 57, "The Lonely Moor;" 76, "Hindley Burn;" 99, "Tickling the Trout;" 342, "Waiting;" and 222, "The Thief's Syke." This last is a vigorous subject, vigorously treated; larch trees against the sky, with a finely broken-up foreground.

The architectural subjects, as subjects, do not call for special comment, but locally, of course, are very interesting.

The salient feature of the series is the fact that by proper handling, the careful study of lighting and judicious selection of

clouds, what in many cases would have been ordinary photographs are transformed into works of art.

Summing up, the effect produced upon our minds by this splendid and unique exhibition is one of unmixed pleasure and admiration of the thoughtful adaptation of means towards ends displayed in many of the works here shown.

Societies' Meetings.

BRAMLEY AND DISTRICT PHOT. SOC:—The monthly meeting was held on the 3rd inst. A paper on "Exposure" was read by Mr. J. W. Nicholson, and a short discussion on the subject followed, in which several members took part. Considerable interest was shown in the exhibition of Whitsuntide holiday work which many members produced. The Secretary exhibited "Watkins' Exposure Meter," which, together with specimen photographs and literary matter, had been sent by the inventor for the Society's inspection. It was intimated that the Committee would receive prints from month to month for the Society's album. Next meeting will be occupied by Mr. F. Young on "Development."

CAMBRIDGE CAMERA CLUB.—A meeting of this club was held at the "Bird Bolt Hotel," on the 30th ult., Mr. F. H. Sanderson in the chair. The President having invited an excursion of the club to Duxford, and promised a prize of a silver cup for best photographs taken in the village, the offer was accepted with loud applause. The offer of the *Cambridge Daily News* to give a prize for the most meritorious work was also received in like manner. Mr. A. Hardy read a paper on "The Advantages of Photography," which was warmly discussed. A vote of thanks to Mr. Hardy for his paper, and to the Chairman for presiding, brought the enjoyable evening to a close.

CROYDON CAMERA CLUB.—Ordinary meeting, Monday, 9th inst., the President in the chair. Six new members were elected. Two new rules, as approved by the Council, were discussed and confirmed. The President announced the following achievements of members since last meeting:—A record in development (described in *AMATEUR PHOTOGRAPHER* of 23rd May), the gaining of honourable mention by Mr. Blow, in *AMATEUR PHOTOGRAPHER* "Monthly Competition;" the initiation by a member of a course of twelve lectures on Photography at Whitgift Schools. The following future arrangements were announced: Mr. E. F. Blow conducts a ramble to Leatherhead, on Saturday, 14th June, starting from West Croydon station at 2.48; the President conducts a party of members to The Grange, Wallington, to visit and photograph "My Garden" (by kind permission of Mr. A. H. Smee, F.R.S., etc.), on Saturday, 21st June, starting from West Croydon Station by 2.48 train; Mr. C. Hussey has kindly promised to read a paper on lantern slides during winter session. A number of prints from fresh negatives were shown, also several meritorious enlargements. The third demonstration in development was fixed for Wednesday, July 9th; the fourth demonstration will be held on 16th July, at Mr. Bishop's. Particulars of Assistant Secretary.

DARLINGTON PHOT. SOC:—The ordinary meeting was held on the 9th inst. Mr. G. Newby Watson presided. Mr. H. W. Hollis read a paper on the "Pizzighelli Process," which was much appreciated. Rev. C. G. Davis read a most interesting paper on "Stripping Films." Both gentlemen illustrated their subjects with specimens of their work, which were much admired.

EAST DULWICH AND PECKHAM PHOT. SOC:—At a meeting held on the 6th inst., the President in the chair, the camera and lens purchased by subscription for the purpose of being loaned to members of this Society was on view. The camera is one of Lancaster's 12 by 10, brass bound, and is a strong, serviceable instrument, the lens (which is of more importance than the camera) being one of C. Burr's well-known make. The camera and lens were taken by the members on the Whit Monday excursion to Pangbourne, and a very satisfactory group was obtained of those members and friends present. During the evening some fine views taken on this excursion were shown by Messrs. Kelly and Greaves, the latter gentleman having been very successful.

HEREFORDSHIRE PHOT. SOC:—A field-day was held on the 5th inst. at Kerne Bridge, Symond's Yat, and the valley of the Wye. The members were met at Kerne Bridge by Alderman Blake, who had kindly provided a boat, and took several of the party to Symond's Yat by water. The remainder visited Goodrich Castle, where they

were met by Rev. D. Seaton, who very kindly acted as guide. Several plates were exposed on the Castle and the Court, a few having the privilege of visiting the Large Hall at Goodrich Court by kind permission of Mr. H. C. Moffat. In the afternoon several members visited the Yat and most points of photographic interest.

HOLBORN CAMERA CLUB.—The usual weekly meeting was held on Friday, 6th inst., when about thirty members assembled to see a demonstration and hear a few words about Alpha printing by Mr. John Howson, of the Britannia Works. After a hearty vote of thanks to the Britannia Company in general, and Mr. Howson in particular, with which was also offered and accepted hon. membership of the club, the meeting was brought to a conclusion.

HOLMFIRTH AM: PHOT: SOC.—The monthly meeting of this society was held on the 6th inst. Members exchanged prints, and a discussion as to their merits followed. An excursion to Cawthorn was decided upon, to take place on the 25th inst.

LEWES PHOT: SOC.—The monthly meeting was held on the 6th inst. The prints sent in to the quarterly competition were on view. Mr. N. S. Starns kindly undertook to act as judge, and attended the meeting specially to explain the merits and demerits of the various prints submitted to him. The certificates in Classes 1 and 2 were both awarded to Mr. G. J. Wightman, who was congratulated by the members for securing both the awards. The President then called on Mr. Wightman, who recounted his twelve months' experience as an amateur photographer, in a very amusing and interesting manner. In the course of his remarks he said he owed his success to the Society, and he advised all who wanted a healthy and instructive hobby to take up photography.

NORTH LONDON PHOT: SOC.—A meeting was held on Tuesday evening, June 3rd, Mr. Hart in the chair. The Secretary read the report of the sub-Committee appointed to select a new room for the meetings of the society, and it was decided upon this report to engage a very suitable room at Wellington Hall, and after the next meeting, on June 17th, the society will remove to its new quarters. It having been decided upon this evening to hold an exhibition of camera-stands and photographers' out-door outfits, several firms had, upon the invitation of the Council, sent exhibits for the inspection of the members. A hearty vote of thanks was passed to all those who had sent goods for exhibition, and it was unanimously agreed that the show was a great success. A vote of thanks was also accorded to Mr. Hart for presiding, and for his promise of the gift of one of his new stands to the society. The next meeting of the society will be on Tuesday evening, June 17th, which will be a technical evening, and the last gathering of the society in Myddleton Hall.

OXFORD PHOT: SOC.—The last meeting was held on the 5th inst., Mr. E. A. Ryman-Hall in the chair. Mr. H. M. Phillips gave an interesting description of the cold-bath platinum process, and developed several prints. He considered this process to be the best form of printing photographs. Discussion on this and kindred subjects afterwards took place. Several members brought their results of the Whit Monday work at Pangbourne. The next excursion will be to Culham on Thursday afternoon, June 19th.

SHEFFIELD PHOT: SOC.—The monthly meeting was held on the 3rd inst., Mr. B. J. Taylor in the chair. Mr. T. G. Hibbert gave a practical demonstration on "Kallotype Printing Process." He said Kallotype, being much more sensitive than ordinary silver paper, care is required in printing, to fill frames in a yellow light or weak daylight, also not to examine them out of doors as with ordinary sensitive paper. He then proceeded to develop some prints. It was agreed that as yet it was not superior, if equal to the platinotype process, but would no doubt be considerably improved.

SOUTHSEA AM: PHOT: SOC.—An ordinary meeting was held on June 4th, Lieut. F. W. Cobb, R.N., in the chair. The Hon. Secretary (Dr. F. Lord) read a letter received from Mr. Griffin, asking if the Society would contribute to an art exhibition to be held in aid of the hospital, and that if so, a small room would be set apart for exhibiting. Mr. J. J. Thornton kindly undertook to make enquiries about the proposed arrangement, and to bring the matter before the next Committee meeting. Mr. G. C. Inkpen then read a paper on "Hand Cameras." He divided these into three groups, viz., (1) roll-holders, (2) dark-slides, (3) automatic changing; and gave numerous illustrations of each type on the board, explaining the various forms and the means for changing plates. Mr. Inkpen also showed a model of his patent one-movement camera, made for twelve ordinary quarter-plates or

twenty-four cut films, the plate being changed and the shutter reset in one motion. The construction of the camera is very simple, but effective, and awaits a manufacturer to take it up.

STAFFS. POTTERIES AM: PHOT: SOC.—At the usual monthly meeting, held on the 3rd inst., arrangements were made for two excursions during the month to Wall Grange and Cheddleton, and Great Haywood, after which Mr. E. B. Wain read a paper on "Art Photographs," with special reference to the composition of pictures. The various laws of perspective, balance, light and shade, etc., were very clearly explained by means of diagrams and prize photographs. The paper concluded with some very useful and practical hints on the mounting and framing of photographs.

TUNBRIDGE WELLS AM: PHOT: ASSO.—The ordinary monthly meeting of the above association was held at the Mechanics' Institute, on Thursday, the 5th inst., the Rev. A. T. Scott, one of the Vice-Presidents, in the chair. Mr. Lewis kindly offered to present a copy of Dr. Emerson's "Naturalistic Photography," which offer was much appreciated, as was also one from Mr. Burton of a landscape painting, done by himself, for competition by members at the next exhibition. The Hon. Secretary then explained his proposition for making some lantern-slides on the same lines as the Boston set of U. S. A. He suggested that two sets be made, one to be given to an American society, and one to be on loan to societies in England, and that members contributing should jot down anything of interest that related to the slides prepared by them, which would form a nucleus for the lecture that is to accompany the slides, which Mr. Brampton had kindly offered to prepare. The proposer estimated that there would be as many as eighty slides in a set, which would include all the points of interest in the town as well as the principal historical places round the district, such as Eridge Castle, Penshurst Place, Hever Castle, Ightham Mote, Bayham Abbey, Scotney Castle, etc. To some of these places members had had excursions, permission having been kindly granted by the owners, and they had secured some negatives which would be of service in preparing for the lecture. It will practically be a survey of the town and district, and a collection of the prints of the above in an album would form an important souvenir of Tunbridge Wells. It will also contain a reproduction of some old prints and engravings, and will form a link between the past and present, the accompanying text adding to the interest. The proposition being put to the meeting was carried unanimously. Mr. Pierson showed, by desire, Rayment's patent camera, which was much admired for its simplicity and good workmanship. Mr. Cassingham brought one of Ashford's new three-fold stands, which was remarkably firm. After some prints had been handed round for inspection, and some negatives of a view which had been developed respectively with pyrogallol, hydroquinone, and eikonogen, an interesting discussion took place as to their merits. The meeting closed with a vote of thanks to the Chairman.

WEST SURREY AM: PHOT: SOC.—The members met at Crichton Hall, Clapham Junction, on the 4th inst., but owing to its being "Derby" night only about twenty were present. The subject for the evening was "Gelatin-chloride Printing Processes," by Mr. G. H. James. The matter was treated in a practical way, and the demonstrations watched with much interest. The next outing (Saturday, 14th) will be to Boxhill and Burford Bridge.

DRESDEN.—A correspondent writes us: "A dealer here, C. F. Bernhardt, Palais Gutenberg, by the Café König, has a dark-room fitted up for his own use, with gas, water, etc., and will be pleased to allow tourists the use of it for changing plates, developing, etc." The same correspondent adds, "I believe it is not generally known that the foreign size, 16 by 12½ centimetres, exactly fits an English half-plate slide."

"INVENTIONS, AND HOW TO PATENT THEM" is the title of a little hand-book dealing practically and exhaustively with this subject. It goes through the whole of the steps necessary, from the making out of the specification to obtaining the final patent, and being written by a barrister (Mr. T. Eustace Smith), the law on the matter is very clearly stated, and the decisions on the various points referred to with chapter and page, so that those interested may at once find the records of the whole case. The book has reached the third edition, and is brought up to date, and these facts are sufficient evidence of its usefulness to recommend it to persons desirous of becoming patentees.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

QUERIES.

3885. View Finder.—Will anyone kindly tell me how to make a small view-finder for quarter-plate camera?—**PIVOT.**

3886. North of Scotland.—I am anxious to spend a few weeks with my wife photographing at some quiet place in the north of Scotland, or in one of the islands on the north-west coast. Could any of your readers tell me of a comfortable farm-house or lodgings in a pretty neighbourhood where we could stay?—**SCOTLAND.**

3887. Rapid Doublet.—I have a Fallowfield's 5 by 4 rapid doublet lens, and want to use the back combination for larger pictures in long-extension camera. What will be the effect upon its rapidity? In its present form it works well with an ordinary go-and-return shutter. Will someone kindly say, supposing picture to be correctly taken, with one second's exposure, using the lens as a doublet, what difference should be made in exposing on the same subject, under same conditions, as to light, etc., using back combination only?—**BRANKSOME.**

3888. Developing Detective Plates.—Would any brother photographer kindly tell the cause why the top part of plate should come out quite clear, while the bottom remains quite misty? I use hydroquinone developer, and with my half-plate camera I can bring them out clear all over.—**PROVINCIAL.**

3889. Eikonogen.—Should be glad of a good formula for Eikonogen developer (given in English quantities) for negatives, and to know if it is workable when made up in one solution only?—**IKE-ON-AGAIN.**

3890. Sulpho-Pyrogallol.—What is the formula of Berkeley's sulpho-pyrogallol?—**LEANDER.**

3891. Bromide Emulsion.—Will any of your readers kindly tell me the way to clean glass plates ready to receive bromide emulsion? Also method of melting and applying same?—**ZINCO.**

3892. Payne's Formula of hydroquinone developer wanted.—**ZINCO.**

3893. Adapter.—Can anyone kindly inform me as to the uses of an adapter, an accessory not mentioned in the "Dictionary of Photography"?—**PRONO.**

3894. Crystoleum.—Will some brother amateur kindly give me some hints as to crystoleum painting, and especially whether any particular make of sensitised paper is to be preferred when printing the photographs?—**PRONO.**

3895. Fallowfield's Hand-Camera.—Can some one who uses this camera tell me which stop ($f/8$, $f/11$, $f/16$, $f/22$), with Ilford white label plates, I ought to use for objects in motion about 20 ft. off? I used $f/16$, but detail not satisfactory. Also, for further distances would you use a larger or smaller stop?—**M. Y. S.**

3896. Gt. Yarmouth and Lowestoft.—Would someone kindly tell me the best photographic haunts in the neighbourhood of Yarmouth and Lowestoft? Which of these two places is most suitable as a centre for photographic excursions? Is this a good district for photography?—**C. G. L. C.**

3897. Whole-Plate Lens.—What is the best cheap whole-plate lens to get for camera?—**G. GILSON.**

3898. Eikonogen.—Is eikonogen better than pyro developer for Ilford ordinary plates?—**G. GILSON.**

3899. Platinotype Gold Bath Process.—Can platinum bichloride be used? What is the differ-

ence between platinum bichloride and platinum salts, as spoken of by the Platinotype Company?—**A. B.**

3900. Most Rapid Lens.—Will anyone kindly inform me which is the most rapid lens, a single or a double, both working at $f/8$, and why?—**LENS.**

3901. Dunoon.—Will any amateur let me know the places worth photographing about Dunoon? Also the best time and place for taking the steamers passing? Any information will be gladly received.—**J. MONTGOMERY.**

3902. Stops.—What are the Nos. of the stops supplied with Lancaster's Silver-Ring Rectigraph? What are the best size stops to use for (1) landscape, (2) seascape, (3) architecture?—**ALPHA.**

3903. Dark Slides.—Would some reader kindly tell me whether Tylar's metal dark slides are reliable?—**BEGINNER.**

3904. Gloss.—Will someone kindly tell me the best way to get a nice gloss on prints?—**AMATEUR.**

3905. Sky.—I have taken several views, and, on development, find about one-third of the plates fogged always when I take in the sky in the view. What is the cause, and how to avoid it? Sun, if any, been on side or back.—**A. G. MILLER.**

3906. Burnham, Somerset.—I should be glad if any of your readers could give me any information about this neighbourhood, whether there are many places of photographic interest in the neighbourhood, and if the place is bracing?—**W. H. WHITTARD.**

3907. Lens, Objective Only.—Can any reader inform me where I can buy a quick-acting single lens, about $\frac{1}{4}$ in. focus, to cover quarter-plate, and about the cost? Please quite understand (no mount), only glass lens, that I can fit into hand-camera. The lens I have of Lancaster's seems to act quite equal to my R.R. Optimus of Perken, Son, and Rayment.—**VALENTINE CHARLES.**

3908. Eikonogen.—Please give me a good Eikonogen to work with Ilford's ordinary plates (time exposure), using soda or potash carbonates, or both?—**J. P.**

3909. Ingleton and Settle.—Can any brother amateur tell me if there is a reliable dark-room at Ingleton and Settle?—**WATERLOO.**

3910. West of Ireland.—Wishing to take a tour round the West of Ireland by rail and coach, I should be glad to receive from any fellow-reader who has visited that country any hints where pretty scenery, any ruins, or other objects of interest may be found for photographing on quarter-plate films?—**J. ATKINSON.**

3911. Glasgow and Inverness.—Amateur would appreciate any hints as to shots (available by steamers stopping, etc.), places to stop at, etc.? For a six days'—not too expensive—outing, from Glasgow to Inverness and back, what would be probable cost?—**HALF-PLATE.**

QUERIES UNANSWERED.

Mar. 7th.—Nos. 3528, 3551, 3554, 3556.

21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3612, 3614.

28th.—Nos. 3634, 3636, 3640, 3643, 3653.

April 4th.—Nos. 3661, 3664, 3674, 3677.

11th.—No. 3694.

18th.—Nos. 3708, 3718.

25th.—Nos. 3727, 3731, 3735, 3736, 3742, 3744, 3747.

May 2nd.—Nos. 3758, 3767.

9th.—Nos. 3793, 3795.

16th.—Nos. 3805, 3808, 3814, 3820, 3822, 3823, 3824, 3826.

23rd.—Nos. 3827, 3828, 3829, 3834, 3839, 3840, 3841, 3842, 3843, 3845.

30th.—Nos. 3852, 3854, 3857, 3858, 3860, 3862, 3865, 3866.

June 6th.—Nos. 3870, 3872, 3874, 3878, 3893, 3884.

ANSWERS.

3839. Lizard.—There is a dark-room at one of the two hotels at the Lizard. I have quite forgotten the name of the hotel in which it is, but if you refer to the Cyclists' Touring Club's Guide, you will find it there. I don't know if developing can be done, but should "F. A. R." be at Penzance during his visit to Cornwall, I shall have great pleasure in lending him a dark-room for changing or developing. Address with Editor.—**H. TONKIN.**

3871. Weymouth.—"Leo" will find plenty of "choice bits" here for the camera, viz., Upwey "Wishing Well," about two miles through a lovely country; Weymouth Sands, which is full of life on a fine day; "shots" at the steamers running, about every hour; Sandfoot Castle ruins, about a quarter of a mile distant; swans feeding (about 200) on the Backwater, and scores of "choice bits" within easy distance. "Leo" will find a very great help in Mr. Smith, at Smith's Supply Stores, who is always willing and ready to help amateurs in choosing, and as regards light. He can there always get plates and anything connected with photography at same prices as in London.—**AMATEUR.**

3873. Glass.—Squeegeeing is placing the wet print face down on glass, and pressing into optical contact with the glass—i.e., no air between. When dry, the print leaves its temporary support with a high polish.—**GREENWOOD.**

3875. Hastings.—Before asking the readers of this paper about a dark-room at Hastings, why do you not write to the Editor, who has taken a very great deal of trouble in printing a long list of names of towns where dark-rooms are at the disposal of the readers of this paper, bringing an introduction card from the Editor? He has two different dark-rooms on the list, as you can see for yourself.—**W. A. J. CROKE.**

3875. Hastings.—There are only two dark-rooms at Hastings, one by the Memorial whose name I do not know, and the other whom I should advise you to go to, both for cheapness and attention. It is not more than ten minutes from the pier, next to the hot-water baths. It is a chemist's, by name Teaver. But why not write to the **AMATEUR PHOTOGRAPHER** for their register of dark-rooms? They have two down for Hastings. It would be a much better plan.—**JOHN H. MONTAGU.**

3876. Lowestoft.—Ilford plates can be had from A. Wright, chemist, High Street.—**J. H.**

3877. Toning Bath.—I would suggest "C. H. T." try the borax bath, thus:—

Borax	...	...	...	...	50 grs.
Gold	...	...	...	...	1 gr.
Water	...	...	...	...	10 ozs.

Use slightly tepid, say about 70 degrees Fahrenheit. This may be used at once, and will keep fairly. It gives very nice purple brown tones.—**GREENWOOD.**

3879. Enlarging and Enlargements.—The Alpha paper developer will be too much restrained for bromide paper.—**J. H.**

3879. Enlarging and Enlargements.—"MCCC." might manage it. Block out a north window all but a space the size of negative. This may be done with laths and brown paper. Fix negative in opening, and place camera back, open, in contact, excluding light with a black cloth. To enlarge a half-plate to 15 by 12, assuming the lens to be 8 ins. focus, it would want to be about 23 ins. from the paper, and about 11 from the negative. Ordinary sensitised paper would take weeks to print; it is quite out of the question. No need to cut your dark slide. You might put negative in it, and pull out both shutters. Alpha developer is too weak for bromide paper. The proper formula is:

Pot. oxalate, sat. sol.	...	...	...	6 parts.
Ferrous sulphate, sat. sol.	...	...	...	1 part.
Bromide of potassium	...	...	...	trace.

N.B.—Put tracing cloth on window to diffuse light evenly.—**GREENWOOD.**

3880. Quickest Dry Plates.—I am surprised you have found neither of the plates you mention quick enough. Yours must be a very small aperture. Try Paget Prize Plates or Isochromatic instantaneous.—**W. A. J. CROKE.**

3880. Quickest Dry Plates.—Use Fry's by all means, or Edwards'.—**JOHN H. MONTAGU.**

3880. Quickest Dry Plates.—Both the Paget 60-times and the Mawson plate are suitable for shutter work, and faster than those you have used.—**MELCHIOR.**

3881. Isochromatic Plates.—The prices are about 50 to 75 per cent. higher than Ilford ordinary; thus 5 by 4 are 3s. a dozen. They are in two rapidities; the slow are said to give more isochromatic effect than the rapid.—**GREENWOOD.**

3881. Isochromatic Plates.—Edwards' Isochromatic plates are manufactured in three degrees of speed—slow, medium, and instantaneous. You ask for the price, but mention no size. It may help you to know that $\frac{1}{4}$ by $\frac{3}{4}$ are 2s. 3d.; $\frac{1}{2}$ by $\frac{1}{2}$ are 4s. 6d.; 12 by 10, 11s. 3d. For further particulars I must refer you to page 125 of Fallowfield's 1890 "Annual," where you will find fuller prices and several good developing formulae.—**W. A. J. CROKE.**

3882. Residues.—It is really not worth the trouble caused unless done in very large quantities.—**W. A. J. CROKE.**

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S POST if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED. AM. PHOTO.**

E. H. GILBERT.—We know nothing against the "mountant," will you let us see a sample?

M. S. P.—We place them in the following order, A, D, F, B, C, E. The one used by the worker you name has been designed by himself, and made specially for him; as far as we know, it is not in the market.

WINCHESTER.—A letter has been sent us in error, only signed "Duncan," we cannot therefore send on only same.

LAUREL.—We are doing all in our power to impress upon dealers and others the necessity of being more prompt in the execution of orders, etc., and sympathise with you, and regret to hear of the inconvenience.

J. R. M.—Your letter with slight excisions is inserted, because it proves how just we are in our accusations.

ERNEST WINN.—You will note we have made use of the information, and will add the name to our list with much pleasure; glad to hear that you are succeeding so well.

T. BAKER.—Have written you; why not send us an article "How we Bought a Camera"?

ARTHUR JANE.—The print is in very good condition, and has retained its colour wonderfully.

L. CATOR.—Nothing just at present; yours can be returned if you wish. A capital article upon Lowestoft and district has been published; see AMATEUR PHOTOGRAPHER, vol. viii., August 31st, 1888.

J. A. S.—You cannot do better than follow the very complete instructions given in the AMATEUR PHOTOGRAPHER for May 30th, under the heading "Printing in Gelatine-Chloride."

E. M. HAMILTON.—Your MS. will be typed and proof sent you.

QUID.—A: not very. B: the R.R. is a good lens, covers well, and gives good definition. C: not as good as A, which has a capital shutter; the lenses are probably the same make.

CECIL SHAW.—Certainly was overlooked, will send on later.

LENS.—We insert as a query.

J. P.—Question No. 1: in the following order, 8, 4, 1, 7, 2, 5, 6. The second question will be found in our "Query" column, as you will doubtless obtain particulars from some one who has used Eikonogen with the plates named.

G. R. FELL.—Write to the Secretary of the Leytonstone Epping Forest Photographic Society, Mr. Joseph W. Spurgeon, 1, Drayton Villas, Leytonstone, Essex.

X. Y. Z.—In answer to your letter. A is as good as you can get for the money. B: cannot say. C: yes. D: the camera you name is one of the best made in the market, and is certainly better than A. E: the best lenses are 3, 7, 9, but you know that you do not intend to buy either of them because of the price. 1 and 2 are both good lenses; in fact, all you name are tried lenses, and the No. 4, which you probably intend to buy, will give you good results. R.R. lens will be best suited for your purpose. Heaps of work has been sent to our competitors which has been done with the cameras you name, and the lens 4. We should advise you to buy direct, and not through an agent.

W. A. PICKNETT.—We have seen all the cameras, and could wish that those sold to the public were up to the samples sent to us for inspection. If you could rely upon B being properly finished, by all means go in for it; it has many good points. We should advise lens 3. F is a good camera, is well made, and has many advantages. The lens we have named is expressly made for hand-camera work; it would, perhaps, be best for you to have an R.R. lens of the ordinary type.

E. GRAHAM.—We shall notice the camera next week, the maker having sent us one for trial. Either A or B are very well made cameras. The lens may not fit the mount, should there be one sent with the camera; but probably there will be no mount, and you will pierce the front and fit on the flange or mount. The lens you have selected is a good all-round instrument, and the tripod cannot be surpassed.

B.—Really we are afraid we cannot help you; they are expensive, and have not all the advantages advertised. You might try Morley, Islington, or Lawley, Farringdon Street.

R. CASH.—We really cannot help you, but should say knock off about 30 per cent. The box camera is really worth nothing. The first lens is, in good condition, worth a fair price, the other will only fetch a few shillings.

FRED DAVIES.—"F. G. S." has drawn attention to the error.

PARISIAN AMATEUR.—Certainly, B. W., which is first-class; we should advise you to write to the makers, and ask them if the lens will cover the angle you require. We would also advise you to procure Dallmeyer's "On the Choice and Use of Photographic Lenses." Your questions require more space than we can give in this column.

M. C. C. C. LUDER.—The best plates are 4, 3, 9, 14, 1. Of the other eleven named, Nos. 11 and 15 are now on the market; 13 we know nothing of, and the others we place in the following order:—2, 5, 7, 10, 12, 8, 16, 6. If you require a really good plate capable of giving good dense negatives, buy a high-class plate, rich in silver, either 4, 3, or 9.

H. MACLEAN.—MS. to hand; will be used shortly. G. L. SNOWBALL.—Your print is duly entered for the next "Monthly Competition." Glad to find that our efforts give satisfaction.

A. C. L.—The print has some blemishes, and is hardly up to the best sent for our "Monthly Competitions." The view is not carefully placed on the plate. The tone of print is not good, being too "pink." The enlarging lantern named is well worth the money asked for it.

V. MISSELBROOK.—(1) We have not much experience of the plate you name; but should think those labelled "Instantaneous" should do the work you require of them. The "Extra Rapid" of the brand you name are labelled 26, but in practice are found to be about 22. We should advise the use

of your largest stop; probably that is $f/8$, as you mention that size. (2) Some operators give the charge needed as from 15 to 20 grs., but it depends in a great measure on the form of lamp used.

R. V. G.—If you wanted a really well finished camera A should answer your purpose, but the shutter is a weak point, especially when you are using it in India. It will, with a good R.R. lens, do all that you require, and will take both time and instantaneous pictures. We think the camera, if strengthened, will stand the climate. C is of the same class, more money, and certainly better made. B is a handy camera, but the lenses sold with it are not always satisfactory. D: there are reasons why this camera would not be suitable in a hot climate, and we think your choice lies between A and C. If we can further help you we are at your service, and shall be pleased to inspect the camera you choose.

F. J. THORNTON.—We thank you very much for your opinion of the apparatus.

A. CONSTANT SUBSCRIBER.—Very glad you were so fortunate.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent., the minimum being one shilling, upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within two days of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Apparatus.—Camera case, waterproof, stiff leather bound, 8s. 6d.; solid leather, 14s. 6d.; good locks, straps; approval; 6 stamps. — 1, Hermitage Mews, Stamford Hill, N.

Watson's Acme half-plate camera, with five double dark-slides and Eastman roller slide, three-fold tripod, with sliding bottom joint and solid leather case, Taylor's 8 by 5 view lens, Ross' 8 by 5 rapid symmetrical, Ross' No. 3 portable symmetrical, Thornton-Pickard time and instantaneous shutter and exposure meter, condition as new, cost £30 3s., price £24; Rouch's Bureks 5 by 4 hand-camera, with two finders, alpenstock stand, and solid leather case, equal to new, price £8; Lancaster's enlarging lantern, with 8 in. condensers and 4-wick lamp, price £6 6s. — Townsend, Attleborough Lodge, Nuneaton.

Cameras, bellows, 10 by 8, with four double backs, cone extension, tripod stand, inner frames, Sergeant's and Marshall's shutters, view finder, bice bags for dark-slides, and box for camera; to be sold at a great bargain. — Apply at Stanley's, 13, Railway Approach, London Bridge, S.E.

Banjo, etc.—7-stringed American head banjo, 25s.; and 52 in. bicycle, balls throughout, see-saw saddle, and lamp, £5 10s.; exchange for whole or half plate camera and lens. — F. Watts, 109, Senegal Road, Bermondsey.

Cameras. — Quarter-plate Instantograph, complete, good condition; 30s.; approval; deposit. — Lyne, Boxhill.

Cameras, etc. — Whole-plate Bilcliff camera, double extension, turntable, three slides, whole-plate rapid rectilinear lens, 11 in. focus, whole-plate rapid landscape lens, 14 in. focus. U.S. mounts and diaphragms to both lenses, Wratten's stand, various sundries, wicker case, lined baize, £10; Chambers' special detective lens, and Thornton-Pickard shutter, £2. — W. Scaling, Asford, Nottingham.

Half-plate camera, long extension, best leather conical bellows, all movements, rapid rectilinear lens, and sliding stand, complete; price £3 10s. — Wm. Hutchinson, Harpole, Northampton.

Lancaster's half Instantograph, complete, as new, in case; also case for stand; sacrifice, £3. — S. McCord, Post Office, Strabane.

Lancaster's half Instantograph, equal new, £3 10s.; cabinet burnisher, 12s. 6d.; also half camera, leather bellows, rising front, folding tailboard, etc., three metal slides, R.R. lens, stand, price £3 10s. — 2, Peter's Street, Dereham Road, Norwich.

Cameras, Lens, etc. — Lancaster's half-plate Instantograph, instantaneous lens, fitted with Iris diaphragm and shutter, one mahogany and two metal double dark-slides; £2 5s. — H. R., 41, Lansdowne Gardens, South Lambeth. Call after 6.

Cameras and Lenses. — Tourist camera, 7½ by 5, four double backs (by Watson and Sons), Beck's 8 by 5 R.R. lens, Phantom shutter, good as new, £7; bellows stereo camera, screw adjustment, pair of excellent lenses, six backs, and flap shutter, 43s.; quarter W.A. Rectigraph, Iris diaphragm, 14s.; quarter W.A. view lens, revolving stops, 7s.; half-plate view, with Waterhouse stops, 10s. — Westport, 1, Wellington Road, South Shore, Blackpool.

Camera and lens, 8 by 5, American make, two double backs, good condition, 15s.; also good bell tent, for camping out, 10s. — Smith, Gas Works, Oxford.

Postage stamp camera, 12 lenses, to take 24 (two positions) on half-plate, and Victoria camera, six lenses, to take six (three positions) on half-plate; £1 10s. each. — Montana, Blackheath, S.E.

Half-plate modern camera, double extension, leather bellows, reversing and swing back, never been out for lens, three double book-form backs, cost £5 18s. 6d., price £4 5s.; Lerebours whole-plate portrait lens, £2 5s. — Biddle, Medlock Street, Manchester.

Film Slides. — Two Vergara's double half-plate film slides, solid form, nearly new, in exchange for plate slides, which must be in perfect condition. — Howell, Kingston House, Caterham Valley, Surrey.

Hand-Cameras. — Kodak detective camera, equal new, cost 105s.; price 55s.; exchange with little cash for Ross' or Dallmeyer's half-plate R.R. — Bygrave, 15, Canterbury Road, Brixton, S.W.

Secret detective camera, Stirn's patent, complete, and in thorough working order; cost 37s.; take 25s. — A. Mercer, 16, King Street, Sparkbrook, Birmingham.

Hand-Cameras, etc. — Optimus hand-camera, 5 by 4 R.R. lens, six double backs, to hold 12 quarter-plates or films, the shutter works at any speed up to 1/25th of a second; can be used on a tripod for time exposures; in perfect condition; price £5; originally cost £7 11s. 6d. — To be seen at Browning's, 63, Strand, W.C.

Quarter-plate detective camera (Turnbull's), R.R. lens, and six double backs, three different lenses, can be used from 5 in. to 7 in. focus, very small, light, and unobtrusive, £5 complete; 3B Suter lens, what cash offers? 1AA Dallmeyer wide-angle rectilinear lens, new, £3 10s. — Cecilia House, Montford Place, Kennington Green.

Harmonium. — Large harmonium, walnut case, 8 stops, good condition; £5; or exchange lens and cash. — Benson, Marlborough Road, Oxford.

Lenses. — A Voigtlander half-plate portrait lens, a Lerebours whole-plate portrait lens, and a Ross portable symmetrical 9 by 7 lens, half prices, or exchange. — Lowden, Reform Street, Dundee.

For sale, Lerebours half-plate portrait lens, with four stops, in splendid condition; price 32s. — Joseph Berry, 24, Back James Street, Bolton, Lancashire.

Half-plate R.R. lens, foreign, good; cost 75s.; sell 40s.; proofs of negatives. — D., Clarke's Library, Richmond Road, S.W.

Optimus Euryscope, 7 by 5, with shutter (time and instantaneous), £4 5s.; pneumatic drop shutter, 4s. 6d. — Howard, 16, Perryn Road, Acton.

For sale or exchange, quarter plate portrait lens (by Dallmeyer, London), No. 2,600; £3; or good half-plate camera and three double backs. — J. Boulton, 4, Belmont Street, Rainbow Hill, Worcester.

Exchange whole-plate view lens for half-plate wide-angle R.R., or half-plate metal slides with adapter. — A. G. Miller, Glenglass Saw Mill, by Ewanton.

Watson's cabinet portrait lens; cost 70s.; take 50s.; good as new. — Henry Lee, Trawden, near Oolne, Lancashire.

Single lens, new, with stops, covers 5 by 4 plate; 7s.; exchange half-plate printing frames, dishes. — H. K., 171, Caledonian Road, London.

Lens, etc. — 5 by 4 Optimus R.R. lens, £1; quarter-plate Lancaster's International slide, new, 5s. — Mansfield, 140, Great Clowes Street, Manchester.

Lens and Shutter. — Dallmeyer's 2B patent, list price £13 5s., in perfect condition, very little used, and Cadet's pneumatic shutter, for inside or outside camera; cost £2 2s.; to be sold cheap, or good exchange; open to offers. — Montana, Blackheath, S.E.

"Photo. Soc. Reporter." — Vol. i. PHOTOGRAPHIC SOCIETIES' REPORTER, excellent condition; 3s. 6d. — Leicester, 161, Croxted Road, West Dulwich, S.E.

Photometer, etc. — Decoudun's photometer, re-touching desk, view finder, Stirn's detective camera what offers? — Address, Wm. Bell, Northallerton.

Print-Washer. — Jefferies' whole-plate print and plate washer, excellent condition; 11s. 6d. — Bygrave, 15, Canterbury Road, Brixton, S.W.

Retouching Desk.—Retouching desk, whole-plate, perfect, with mirror and drawer; only 7s. 6d.—Tooth, Stephen Street, Rugby.

Sets.—Good half-plate Instantograph camera, two slides, lens, shutter, tripod, and lock-up case; cost £5; offers wanted; satisfactory reasons for selling.—Mallinson, Springvale Road, Sheffield.

What offers for Lancaster's Special patent quarter-plate camera, rapid Rectigraph lens, three double dark-slides shutter, tripod? Cost £7.—E. Mayhew, 36, Castle Road, Kentish Town, London.

Lancaster's 1890 half-plate Instantograph, dark-slide, tripod, and f/8 rapid rectilinear lens, quite new; cost 105s.—bargain, 73s.—E. Ernest, 2, Hawthorn Villas, Slad Road, Stroud.

5 by 4 box camera, outside measurement 10, 7½, 5½, spring lock, rectilinear lens, Thornton shutter, three double backs; 63s.—Gill, Clarendon Road, Seacombe.

Lancaster's 1889 Instantograph, with lens, Iris diaphragm, instantaneous shutter, two double dark-slides, and tripod, complete, condition almost new; cash offers requested.—Sewell, Bookseller, etc., Barrow-in-Furness.

Camera, 8 by 5 (by Meagher), two double and one single dark-slides, triple achromatic lens (by Dallmeyer), and folding tripod, all in perfect order; what offers? cash.—Halford, 4, Grove Gardens, St. John's Wood, London.

Set, Shew's half-plate, leather bellows, reversing back, swings, rising front, long extension, three double backs, Ross' 8 by 5 rapid symmetrical lens; cost £11 10s.; offered for £8 10s.—Howson, Brockenhurst, Ilford.

A quarter-plate Shew's detective lens and shutter, with 3½ in. square camera, rack-work movement, three backs, case, and walking-stick stand, especially made for magic lantern slides; £5.—Add ess, M. D., 128, Fulham Road, London.

Underwood's quarter Instanto camera, Ross' lens, time and instantaneous shutter, Lancaster's Universal tripod, dark-slide; cost £4; sell for £3 5s.—Address, Camera, 26, Duke Street, Chester.

Lancaster's half-plate Instantograph set, as new, camera, double extension, leather bellows, reversing back, rising front, instantaneous lens and shutter, double slide, folding tripod; cost £4 4s.; offers.—G. Greening, 20, Grove Terrace, Bradford, Yorks.

Shutter.—For sale, Phantom instantaneous shutter, fit any hood up to 2½ ins.; cost 27s. 6d.; price 13s. 6d.—F. Sharpe, Oakham.

Steam Engine.—Exchange or sell good model steam engine (value £6) for good quarter-plate camera, with three double backs and lens; approval.—Sheppee, jun., Finchley, N.

WANTED.

Apparatus.—Sundries, half and quarter plate set of developing and toning dishes, deep porcelain preferred, whole-plate camera case, half-plate portable tripod, two whole-plate double dark-slides, all good and cheap.—Graveson, Biskey Howe Terrace, Windermere.

Cameras.—Half-plate stereoscopic camera, complete, with removable partition, cash, or exchange camera, conical bellows.—Gould, 73, Littledale Road, Seacombe, Cheshire.

Lancaster's half-plate Instantograph, must be in good condition.—Particulars to James Beckett, 21, Upper Mossack Street, Bradford.

Cameras, etc.—Quarter-plate camera, with or without lens, one or two double dark-slides.—Fletcher, 7, Main Street, Cockermouth.

Would give 30s. for well-made, light-worthy, half, square bellows camera, with three double wooden slides; folding tripod also wanted; give makers' names and description.—Hendrie, Orwell Place, Edinburgh.

Camera Case.—Half-plate camera case, must be good and moderate in price.—Pope, North Hill, Highgate.

Changing Bag.—Good changing bag for whole-plates; particulars.—315, Crookesmoor Road, Sheffield.

Enlarging Lantern.—Enlarging lantern, quarter-plate; approval; state particulars.—Arthur Lewin, Castle Grove, Tuam, Galway.

Hand-Cameras.—Detective camera, or offers for chemical balance and weights (by Becker), battery, bicycle lamp, etc.—Graham, Barnob, Harrow.

Facile hand-camera, rapid rectilinear lens, stops, finder; reliable, approval; deposit to £4.—Fitzgerald, Earls Court, Tunbridge Wells.

Hand-Cameras, etc.—Camera, hand (Shew's), with Taylor Hobson lens, 5 by 4 shutter, and Iris diaphragms attached.—Wm. Jeffrey, Royal Exchange, Glasgow.

Shew's Heliopie hand-camera, complete, whole-plate, folding tripod, a rapid shutter to fit 2½ in. hood; all on approval.—Dr. Fitzgerald, Bouverie Road West, Folkestone.

Lenses.—Good fixed-focus lens for quarter-plate, cheap for cash.—Abel, Carriers Dock, Liverpool.

Lens, etc.—Best half-plate Instantograph or similar pattern R.K. lens, accessories; good cash price.—F., 10, Stoneleigh Terrace, Coventry.

Sets.—Whole-plate camera set; approval.—Apply, Pitzer, 155, Kingsland Road, London.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE PROPRIETORS OF THE *AMATEUR PHOTOGRAPHER* offer, Monthly, two prize consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP),

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	June 14.
LANDSCAPE WITH FIGURE	July 14.
GENRE OR FIGURE STUDY	Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS ETC.	Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors.

In addition to the Medals being given, the prize photographs may be produced in the *AMATEUR PHOTOGRAPHER*.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Competitive prints are available for exhibition before Photographic Societies after the 1st of each month.

Entry forms on receipt of stamped addressed envelope.

FURTHER PARTICULARS ON APPLICATION.

PLEASURE CRUISES to the LAND of the MIDNIGHT SUN.—The ORIENT COMPANY'S steamships GARONNE (3,876 tons) and CHIMBORAZO (3,847 tons) will make a series of TRIPS to NORWAY during the season, visiting the finest fjords. The dates of departure from London will be as follows, and from Leith two days later:—

June 4th, for 15 days	July 15th, for 15 days
June 18th, for 27 days	July 23rd, for 27 days
June 25th, for 15 days	Aug. 8th, for 21 days

The steamers will be navigated through the "Inner lead"—i.e., inside the fringe of islands off the coast of Norway—thus securing smooth water; those of the 18th June and 23rd July will proceed to the North Cape, where the sun may be seen above the horizon at midnight. The Garonne and Chimborazo are fitted with electric light, hot and cold baths, etc. Cuisine of the highest order.

Dark Room provided for the use of Photographers

Managers, F. Green and Co., 13, Fenchurch Avenue; Anderson, Anderson, and Co., 5, Fenchurch Avenue, London, E.C. For further particulars apply to the latter firm, or to the West End Agents, Grindlay and Co., 55, Parliament Street, S.W.

EDWARDS' ISOCHROMATIC PLATES.

"Lafayette" writes:

"Dublin, March 29, 1890.

"You will be glad to hear that I have been awarded the Gold Medal at the Crystal Palace Exhibition. I am exhibiting four of the extra large pictures, size 33 x 19, and then some grand panels and 15 x 12's, all on your plates, and taken direct."

B. J. EDWARDS & CO., THE GROVE, HACKNEY, LONDON.

ELLIOTT & SON'S "BARNET" Dry Plate

Reasons why all Amateurs should use them:

Because they are evenly and thickly coated; Rich in quality; and are absolutely reliable. They are inexpensive, quickly developed, and never frill. And although they are very Rapid, they are at the same time easy to manipulate, and allow of great latitude for over and under exposure!

ORDINARY	{	$4\frac{1}{4}$ by $3\frac{1}{4}$	..	..	1/0 per dozen.		EXTRA RAPID	{	$4\frac{1}{4}$ by $3\frac{1}{4}$	..	..	1/4 per dozen.

The AMATEUR PHOTOGRAPHER

Edited By CHARLES W. HASTINGS.

1, Greed Lane, Budgate Hill, London, E.C.

TELEPHONE No. 1645. Telegraphic Address: "VINEY, LONDON."

VOL. XI. No. 293.]

FRIDAY, JUNE 20, 1890.

[PRICE TWOPENCE.]

OUR VIEWS.

To hold as 'twere the mirror up to nature."—Shakespeare.

THE photographs contributed to the AMATEUR PHOTOGRAPHER "First Ladies' Photographic Competition" were judged on Thursday in last week. The following is a copy of the award:

"We, the undersigned, having examined the photographs sent in to the AMATEUR PHOTOGRAPHER Ladies' Competition, unanimously declare that the prizes shall be awarded in the following order:

First Prize (Gold Medal).—Miss E. DORA ANDERSON.

Second Prize (Silver Medal).—Miss CLARISSA MILES.

Third Prize (Bronze Medal).—Miss A. V. ABINGDON-BAYLEY.

Signed { EVELEEN MYERS.
EDITH SCANNELL.
IDA VERNER."

Miss Anderson has not before taken one of our medals, but her work sent to the "Home Portraiture Competition" was greatly admired, and we are sure all those who have the good fortune to see the pictures will admit that the award is well merited for her genre and portrait studies. Miss Miles has twice been awarded the AMATEUR PHOTOGRAPHER Silver Medal, the first at the Third Amateur Photographic Exhibition held in 1887, and last year at the York Photographic Exhibition. The pictures are charming examples of artistic posing. Miss Abingdon-Bayley secures the Bronze medal for landscape and landscape with figure subjects. There are several other contributors whose work deserves special attention, but we must reserve our further remarks and criticism, partly from lack of time, but chiefly from the fact that the prize pictures are in the hands of the Editor of the *Lady's Pictorial*, who has asked to be allowed to reproduce selected photographs to illustrate an article upon the competition and the benefits and pleasures ladies may derive by practising photography. It may be interesting to state that in this competition the prize winner has the option of having the medal mounted as brooch or pendant, or, of course, it can be had in the usual form with a ribbon and clasp. We are greatly indebted to our lady judges, more particularly to Mrs. Myers, who at the present time, owing to the quickly approaching marriage of

her sister, the talented Miss Dorothy Tennant, with Mr. H. M. Stanley, is much engaged. Both Mrs. Myers and her two colleagues, Miss E. Scannell and Miss Verner, were charmed and delighted with the work sent in; their satisfaction, and the fact that so many responded to our invitation, has emboldened us to project another competition particulars of which will be announced early, if not in the first week, in July. The photographs will be "on view" during next week at our offices.

* * * *

We have received some further particulars of Mr. Paul Lange's trip to Iceland. He will sail on the 26th inst. from Liverpool in the steam yacht *Myrtle*, and will be accompanied by a talented journalist, our Liverpool District Editor, and by a gifted artist, Mr. T. Kelly, who has already won his laurels for descriptive sketches in pen and ink. Mr. George Thordahl, the organiser of the trip, will also be with them, and it is intended to "do" Iceland thoroughly. There is little doubt that ere long Iceland will be visited almost as much as Norway. We shall hope to hear of the travellers whilst *en route*, and shall, if so, keep our readers advised of their movements.

* * * *

We are now in a position to give the full contents of the July PHOTOGRAPHIC QUARTERLY, which will be as follows:—Is Art Indebted to Photography? by Mr. Peter Macnab; "Sun Pictures in the Valley of the Nile," by Major J. Fortuné Nott, illustrated with pictures from negatives by the author; "Photography in Natural Colours," by Mr. F. Bligh Bond, with full-page chromo-collotype, printed from three negatives taken by the author. This illustration is, we believe, unique in the annals of photography, and will give the nearest approach to photography in natural colours that has yet been attempted commercially. Each negative, before exposure or at the time of exposure, has been made sensitive to a special colour, and the natural colours have been followed in the reproduction as closely as possible. The subjects—fans, china, feathers, flowers, drapery, etc.—have been chosen with a view to show the possibility of securing gradation

of tone in photography. The work, though expensive, is likely to receive considerable attention, and the publication of this print in the *QUARTERLY* marks another epoch in photographic science, and its aid to art. The other papers are, "A Plea for Systematic and Associated Work in Photography," by the Rev. T. Perkins, M.A.; "Breadth and Atmospheric Perspective," by H. Dennis Taylor; "Portraiture and Journalism," by Charles E. Pearce, illustrated with sketches by Shirley Hodson; "A Tourist's Equipment, or How must I be Prepared before Starting?" by the Rev. Precentor Mann, M.A. The number of articles is somewhat less than usual, but they are of a highly instructive and interesting character, and will well repay the most careful attention. We understand that the article promised by Mr. T. R. Dallmeyer on "Some Points in Connection with Light and Photography," has had to be held over for the present.

* * * *

No less than 58 entries have been received for the "Travelling Studentship Competition," and although this week we cannot give any particulars as to who will adjudicate upon the photographs sent in, we shall hope next week to be able to publish their names.

* * * *

WE hear on all sides that a large attendance is expected at the Photographic Convention, of which we gave particulars last week. Given fine weather, a more delightful week's outing could not have been arranged. The Council of the Convention deserve support, and we hope many of our readers will become members. The subscription is low, and if the transactions were published in book form, they would contain a very valuable record of the progress of photography.

* * * *

It will be remembered by many of our readers that efforts have not been wanting on the part of those interested in the practical side of photography to bring about a uniform or standard of screws for the flanges of photographic lenses. The following firms have subscribed their names to a letter, which we publish below:—Messrs. Ross and Co., J. H. Dallmeyer, R. and J. Beck, W. Wray, Henry Crouch, and James Swift and Son.

"We who were present at the meeting, with every desire to assist in the settlement of this important question, were convinced that the sizes arranged would not be universally adopted by the leading manufacturers. We felt, however, quite confident that it would be possible to arrange a series of flanges which could be adopted by ourselves, and which should also be of such a character that the majority of lenses now in the market should screw into them."

"We are making a careful investigation into the matter, and we have gone quite far enough to see that we shall be able to adopt such a series of sizes. Several important considerations are being carefully considered, amongst which may be mentioned the absolute necessity of arranging a series of diameters which are in suitable ratio to the dimensions to which the lenses themselves must be made. In order, therefore, to obtain standards that will be in future adopted by the leading makers, we are carefully arranging a series of sizes to which we shall work in future, and which we shall submit for the careful consideration of the Photographic Society of Great Britain, and the Photographic Convention."

* * * *

WE have received the last issue of *The Park Hurstian*, a school magazine which is always illustrated by photography. The frontispiece in the number under notice is

a well-arranged group, and we are sure that the boys' mothers, sisters, cousins, and their aunts, to say nothing of the relatives of the sterner sex, must have been much pleased at receiving such an excellent photograph. The prints are all prepared by the boys, under the guidance of Mr. D. Johnston, and are most creditable. In writing us, Mr. Johnston says:—

"I forward you a copy of our school magazine, from which you will see that your pupil and your pupil's pupils are at least persevering. If we are not progressing it is not the fault of our teachers—the *AMATEUR PHOTOGRAPHER*, the *REPORTER*, the *QUARTERLY*, and Keighley's beautiful pictures. We had four negatives to print from, and did some bromides, some platinum-types, etc., but can get nothing to equal the chlorides."

The occupations of printing, toning, mounting, etc., are admirable for school boys, and teaches them to be exact, neat, quick, and clean. The boys at Park Hurst School, Buxton, in all these respects have done well.

* * * *

In connection with "Photographic Surveys," the following letter from Mr. E. Howarth, F.R.A.S., appears in the *Sheffield Independent*:—

"In your very interesting article on the subject of a photographic survey of Warwickshire you refer to a similar scheme submitted last year to the Sheffield Camera Club for a survey of the Sheffield district. As the one who submitted the proposal for a photographic survey of Sheffield to the Camera Club, I regret to inform you that at the end of last year the Sheffield Camera Club passed the following resolution, which certainly does not reflect very great credit on the energy and public spirit of its members:—'That owing to the lack of interest shown in the photographic survey the scheme be given up for the present.' Now that you have called more prominent attention to the subject I trust it will be taken up by those able and willing to carry it out. There are in the Camera Club many members who are quite able and I believe willing to do their share of the work, and if the Photographic Society of Sheffield would also join in the work it would soon make good progress. In submitting the scheme to the Camera Club last year I read a somewhat lengthy paper setting forth some of the methods of carrying it out, and in reading Mr. W. J. Harrison's scheme for Warwickshire in one of the photographic journals I was much gratified to find how closely it followed the lines I had suggested in my paper. I hope the large body of amateur photographers in Sheffield will now take the matter up, and they cannot better make a start than by holding a preliminary meeting, as suggested in your article, for of all things it is absolutely necessary that the scheme to be successful must be carried out according to a definite plan. I shall be very pleased to send a copy of my paper to any one willing to join in carrying out the scheme."

* * * *

THE Monthly Competition, "Landscape and Seascape," has been largely contributed to, no less than eighty-eight ladies and gentlemen having entered their photographs. We shall, as before, give Silver and Bronze Medals for first and second best pictures both in landscape and seascape. These prints will form the first contribution to our new sets of loan photographs. The sets will be ready for loaning after the 13th of September. All the old prints have been either presented to hospitals or destroyed. We have to complain that many of the photographs sent round the country by us last season received very rough treatment. We shall be glad if those Secretaries of societies who may desire the loan of the *AMATEUR PHOTOGRAPHER* "Monthly Competitions" will make application early, in order that the route for the boxes to take may be determined upon. In all cases it will be as well to name, say, three dates. The standard of work sent to the current competition is exceedingly high, and the photographs of themselves will afford sufficient matter for a good exhibition.

Letters to the Editor.

THE CRUSADE.

SIR,—When I last wrote to your admirable journal I did not propose again to occupy your valuable space, as the ball being once set going, I trusted that other correspondents with abler pens, and perhaps more leisure, would continue the fight. But I cannot refrain from once more asking you to insert another letter, as I should be wanting in gratitude were I not to thank you most sincerely, and in the most public manner, for the invaluable service you have rendered the photographic world generally, and the amateur section of it in particular, by the very bold and thorough article which you have printed on our grievances. I say bold advisedly, as it must require much more than the average courage and honesty to lay bare openly the plague-spots of fraud and extortion that are so prominent a feature in the commercial life of a powerful fraternity in which you must necessarily take an interest. You have earned the grateful thanks of thousands for the crusade you have inaugurated, and I have little doubt that your action will mark an era and bring in a time when it will be possible to indulge a pleasant and useful hobby without being fleeced or imposed upon at every turn. The experience of nearly every lover of photography will, I feel sure, endorse the words of your article, concerning the high prices, the scamped workmanship of photographic apparatus, and the insolent treatment that follows when complaints are made.

Another cardinal sin practised by almost every dealer is the filling his catalogue with the most mendacious statements, a species of literary lying that doubtless comes under the criminal law, if victims would but take the trouble or had the courage to invoke it. There is another section of this subject which I trust you will also take up. The unsuccessful dealer, whatever else he may be, is seldom otherwise than an accomplished student of the failings of poor human nature. He is appealing to a world largely made up of novices, who, with the ingenuousness of youth and inexperience, are ready to receive whatever they see *in print* as accurate as the ultimate truths of religion and science. The bitter blow of a painful awakening comes soon enough, but too often the victim has no one to advise or help him, and is wholly in the power of his unscrupulous master. Those living out of England know the well-nigh impossibility of finding a dealer who will act honestly and fairly. Such, at least, has been my case. In most other trades the pressure of competition and the demands of the period are rapidly reducing the producer, the dealer, and the buyer to a just and reasonable level of profit, but with those having to do with photographic materials the case is quite exceptionable. Here the present profits are quite out of all proportion to the cost of production, and manufacturers and dealers accordingly wax fat, and, ceasing to be servants, become the hardest of insolent task-masters. Were the goods supplied of fair quality or of the advertised nature, few would object to pay even a high price. But they are seldom either. In an extensive experience of dealers and their catalogues (as, living much abroad, I have to rely on the good faith of both) I can only say that, without possessing any special amount of charity, I should be extremely sorry for my worst enemy to go through what has so far been my fate.

Before closing this already long letter I should like to add a word on another though kindred subject, which, however, being partly personal, is of far less importance. Some weeks back I, in common with others of your readers, ventured to raise the standard of revolt against the present system of extravagant prices. The cost of hand-cameras was specially chosen as an example, and of them the Kodak was taken as a type. One correspondent stated that the lenses (the expense of manufacturing which is always claimed as the reason for the high prices asked) of this latter camera could be purchased at first-hand for sixpence apiece; since then he has corrected his statement to threepence. The correspondence had not gone far, when suddenly a certain Mr. William H. Walker, who seems to hold some position on the staff of the Eastman Company (the proprietors of the said Kodak), leaped into its midst and, like a cheap-jack at a fair, began pouring forth volumes of words, obscuring the main issue and advertising the wondrous merits of his Company's goods. The only thing concerning his wares he omitted to mention was their absurd prices.

This voluble tradesman has now singled me out as a special object of attack, or as the special means of burking the truth on

the original issue. He has launched, in the last number of your journal, at my innocent head a flood of choice eloquence, liberally adorned with adjectives, and couched in that peculiar American style we have long learnt to know though not yet to appreciate. This, of course, is a matter of but small importance. I shall doubtless survive it. What *is* of importance is to obtain a clear and decided answer to Mr. Norris' original statement concerning the first cost of the Kodak No. 1 lens: (1) Is it or is it not threepence or sixpence, or some sum approximate to these? (2) What *is* the actual cost of production of a finished Kodak No. 1, for which five guineas is asked? Upon an answer to these questions the public will be able to form a pretty accurate idea as to the amount of profits manufacturers till now have reaped from the sale of hand and other cameras, as also upon the important question of the prices of lenses. In all the letters so far published by the Eastman Company's representative, the only questions relevant to the points at issue have been carefully ignored. This silence is significant. With the personality of Mr. William H. Walker the world at large has no concern; *he* is merely a detail, though I admit a noisy and unpleasant one, in the discussion. No one proposes to buy *him* and use him as a hand-camera, if for no other reason than that his own valuation would be far too high, and that of the public far too low, to make it worth his while to give up his present situation. Finally it may be doing Mr. William H. Walker a real service to hear a sad though sober truth. Photography does *not* depend (as he appears to think) wholly upon the Eastman Company for its life, neither does the Eastman Company, I presume, entirely owe its position to Mr. William H. Walker.

Once more thanking you for the great service you are doing to all workers in the art you so ably represent, I am, etc.,
Trieste, June 11th, 1890. F. G. B.

* * * *

ALBUMENISED PAPER.

SIR,—I see in your issue of June 13th that "J. R." complains of my paper, and suggests that it might be cut from remnants. I am of opinion that before you publish remarks of that kind from a writer who has not the courage to sign his name and address, and which are intended to damage the reputation of a manufacturer, it would be fair to ascertain if the writer has failed to obtain satisfactory explanations from the maker, who is often able to point out the proper remedy for the defects complained of. Having to use raw paper made at various times of the year, more or less suitable for its manufacture, I do not profess that every sheet shall at all times be absolute perfection, the more so as defective paper can only be detected after printing and toning.

I know of no case where I have not exchanged paper (either printed or not printed, cut or not cut) that showed any defect in the making, and it is most disheartening to have such unfair and damaging statements published. In the majority of cases the defects complained of are attributable to some fault in the manipulations; but where this is not the case I am honest enough to admit the defect, and most willing to exchange for fresh paper.

I hope that in fairness to myself you will publish this reply, as I am sure that you do not conduct the present crusade against manufacturers and dealers all one-sided.—I remain, yours, etc.,
OTTO SCHÖLZIG.

31, Binfield Road, Clapham Road, S.W.
14th June, 1890.

NOTE.—It is our desire to have both sides of the question in these columns, which are open for any explanations which are couched in temperate language.—Ed:
AM: Phot.

THE PACKING OF DRY PLATES FOR TRAVELLING.

SIR,—I have always advised in taking plates any long journey that they should be packed in solid blocks of a dozen in each packet face to face, with orange paper round every four plates, but with nothing between the films, and with at least two thicknesses of strong brown paper, free from pinholes, tightly wrapped over all. In this way I have never had any plates broken or scratched. On the contrary, the grooved boxes have caused me no end of trouble, especially the ones with paper frills. They are bad, for six reasons at least:

- (1) They are more bulky than in the solid.
- (2) Should a box be opened at the custom-house by an ignorant official, or accidentally in daylight, *all* the contents are at once,

spoil, whereas only four plates can be spoiled by the solid method.

(3) In the solid method the packet may be dropped on the ground, and jumped on almost with impunity if tightly packed, whereas in the grooved boxes the outer plates invariably break.

(4) In the case of the grooved boxes, if the outside plates are put in wrongly, *i.e.*, with the films outwards, which can easily occur, they get dreadfully scratched by the side of the box.

(5) In the case of some boxes minute particles of cardboard and glue get chipped off, and get ground up to a fine dust by the plates, and blowing about get soon over the surface of the plates.

(6) They take three times as long to pack in the dark as by the solid method.

I am convinced that Messrs. Edwards would have a larger sale for their undeniably excellent plates if they were to take the hint, and abolish for ever their abominable boxes with paper frilling, and adopted some plan like Thomas or Wratten for packing them.

It may be urged that the experiment I related at the Photographic Society's last meeting would be a conclusive reason for not packing exposed plates film to film, and this objection would be valid had any of the plates been exposed to sunlight; but the amount of light that the plate in the slide actually receives is quite insufficient to do any harm to a plate, either exposed or not, placed face to face.

In conclusion, I may add that I have every year for the last nine years taken plates abroad during my vacation tour, and I have never had reason to regret having packed them up in the way I have described, and have always been sorry when I have departed from this method.

Perhaps the simplest and best method of all is to wrap up the several packets of two or four plates (done up in orange paper), in such a quantity that when in one outside wrapper they will just slip into either a sliding or an ordinary lid-covered cardboard box. Two rubber bands will then be all that is necessary to finish the operation.

It is the importance of the subject and the absurd notions which prevail about it, that is my excuse for thus filling your columns.—I remain, yours, etc., J. LINDSAY JOHNSON.

14, Stratford Place, Oxford Street, W.,
June 14th, 1890.

BIRKENHEAD v. BIRMINGHAM.

SIR,—Referring to Mr. J. H. Pickard's letter to me, a copy of which appears in your issue of the 6th inst., I shall be glad if you will give me an opportunity of substantiating the claim for originality made on behalf of the Birkenhead Association. Mr. Pickard's arguments are far from as conclusive as he imagines when writing his somewhat discourteous postscript. To the other portion, or rather, to his letter proper, I can take little objection; the facts are no doubt perfectly correct as far as they go, but some of the phrases are not happily conceived, as, for instance, "The Birkenhead Photographic Association appears to have produced," etc., and again, "exhibited for the first time a month or two back." There is no doubt about the Birkenhead Association having done so, then why the word "appears"? The slides were certainly shown a month or two ago, but had been shown also more than twelve months previously.

Mr. Pickard says that in my brief letter to him I claim three things:

(1) Originality for the scheme which the Birmingham Photographic Society have in hand for the Photographic Survey of Warwickshire.

This I certainly do still, even after carefully reading all the arguments he brings against it. When he proves (?) the thing to have been done twenty-five and fifty years ago, he distinctly shows that the Birmingham Society is not the originator, as claimed by its Chairman. The Birkenhead Association took the Ordnance map, divided it into numerous sections, and allotted these sections to the individuals by ballot; this is a far different affair from getting together a thousand or so negatives. We are not discussing a point of magnitude, but a thoroughly well organised scheme.

(2) To have been the first in the world to undertake such work.

The public Press has frequently referred to this fact, which still remains undisputed.

(3) That the survey of the hundred of Wirral is an accomplished fact,

This is so to a certain extent; the object was to condense as much as possible, and not to enlarge indefinitely. Mr. Pickard further raises a point of distinction between the hundred and a county. There seems little, if any, difference, to my mind; the hundred of Wirral covers a very large area.

The Birmingham Society has a splendid work before it, and, from the details vouchsafed by Mr. Pickard, the work will be done on a grand scale, and will be the more valuable as it is not to be purely photographic. When I contemplate the possibility of such work being consigned to the dusty corner of a public library, I am forced again to parade the Birkenhead Association's plan, and suggest the advisability of, at any rate, gleanings being made into slides upon which to pin a lecture or lectures.

Apologising for having, in the interests of my fellow members, trespassed so much upon your space, I am, yours faithfully,

Mountside, Rowson Street, C. B. READER
New Brighton, (Hon Sec., Birkenhead Photographic Association).
June 16th, 1890.

BLISTERS.

SIR,—One repeatedly sees directions how to avoid blisters in albumen prints, and Mr. Robinson, in a recent article, implies that they render the prints useless, but I have never seen any method described of how to save prints when once blistered. The other day, through overheating, nearly the whole batch of prints blistered in the toning bath, most of the blisters being of the usual pimply description, but four or five were much larger. In the fixing they increased enormously, varying in size to larger than half-a-crown. After twenty-four hours' washing I determined to try and save the prints, though when the faces of large portrait-heads were swollen and distended out of all recognition, the case appeared hopeless. I slid them on to a ferrotype plate, and, covering them with blotting and brown paper, I stroked the blisters very gently with the squeegee in different directions, watching carefully to see that there was no puckering. Gradually the blisters subsided, and when they had been flattened down hard with the back of the squeegee, the paper and detached albumen were brought into contact with equal tension on each. On curling off the plate, the smaller blisters were absolutely invisible; the larger ones cockled slightly, and the prints were so far useless. But in mounting, the glycerine being only lightly applied to the blister to prevent soaking through the paper, an equal strain was once more put on paper and albumen, and perfect contact ensued. In no case was it possible to detect the slightest trace of the blisters by looking direct at the mounted prints, and only in the case of the largest blister of all, by looking sideways, could a very faint outline of it be detected. I passed all the prints through the burnisher, and could not wish for better proofs.—Yours faithfully,
June 15th, 1890. J. J. RIX, M.A.

* * * *

PHOTOGRAPHIC SOCIETY FOR CAMBERWELL.

SIR,—It has been suggested that a Photographic Society should be formed in Camberwell, and in furtherance of this a few amateurs residing in the neighbourhood have arranged to meet at the Stirling Castle Hotel, Church Street, on Wednesday, the 25th inst., at 8 p.m., to consider the matter.

With your usual courtesy perhaps you will be able to find room for the insertion of this letter, as no doubt some of your readers, amateur or professional, interested in the subject, may be glad to know of the formation of such a society, and willing to promote it by attending the meeting.—Yours faithfully,
Louth Road, Camberwell, GEO. C. PIKE.
June 17th, 1890.

* * * *

BEAUTY SPOTS IN AND NEAR WATFORD.

SIR,—No doubt many of your readers who, like myself, are unable to join any photographic society, would be glad of an opportunity to hunt in company with other amateurs for pretty "bits." If any of your readers who live in the midst of an attractive neighbourhood near London or other large town would offer, through the medium of your columns, to conduct a party of your subscribers on a given date, probably many would gladly avail themselves of the opportunity. To give the plan a start, I shall be pleased to conduct any amateur photographers on Saturday, the 28th inst., through some of the beauty spots in and near Watford, starting from Watford Junction station at

349. Trains leave Euston at 3.15, and Willesden Junction at 3.25 for Watford.—I am, sir, yours, etc., T. GARDNER.
Rosebank, Queen's Road, Watford,
June 16th, 1890.

* * * *

ACID FIXING BATH.

SIR,—In answer to Mr. Fred Davis's question, "Who is right?" Both are. Acidity in the hypo bath does decompose it, liberating sulphurous acid (SO_2) and precipitating sulphur, but hyposulphite of sodium, or, more correctly speaking, thiosulphate, is not the acid sulphite, that name being applied to quite another salt, namely, NaHSO_3 , whereas the formula for the thiosulphate is $\text{Na}_2\text{S}_2\text{O}_3$.—Yours, etc., FRED KNOTT, F.C.S.
June 15th, 1890.

* * * *

ABRAHAM'S IDEAL CAMERA.

SIR,—Your correspondent has evidently got hold of a defective "Ideal," or is not sufficiently acquainted with its working.

I was entrusted with this particular make of camera before it was issued to the public, for the purpose of testing its capabilities, and exposed a great number of plates, and I must say, with all fairness to the makers, that I found it an excellent instrument. The camera I used was fitted with Laverne's lens, and the only fault I could possibly find with it was that, owing to the lens being stopped down, it was necessary to expose the plates in a bright light in order to secure a fully exposed negative. Apart from this the camera is perfect. I now understand that Mr. Abraham is fitting this camera with Taylor's lens and an improved shutter, and I have seen some excellent work done with it. Having had a deal of experience with Mr. Abraham's hand-cameras, I have not the slightest reason for complaint. At the present time I am using one, and have exposed 500 plates with the most happy results.

I am in no way interested in Mr. Abraham's business, but am frequently brought into contact with him in business matters, and feel assured that had your correspondent returned the camera to Mr. Abraham the defect would have been remedied.

—I am, yours, etc., EDWD. A. GOLLEDGE.
Ilford, June 13th, 1890.

SIR,—A word for Mr. Abraham. A friend made for himself a hand-camera, and got an advertised cheap R.R. lens from Abraham, which satisfied him thoroughly. He afterwards made a similar camera for me, and I too sent to Mr. Abraham for a lens of the same type. For this I paid something like 25s. nett.

I first worked it on half-plate, the corners of which it did not cover, but gave good definition. It covered a 5 by 4 well, and gave me some capital bits.

For three months it has been in my quarter-plate hand-camera, with fixed focus, and works so well that I wish for none other. If the "cheap" "Ideal" be fitted with this, the lens is sufficient.—Yours, etc.,

Melton Mowbray.

WILLIAM ADCOCK.

NOTE.—Letters have also been received from Mr. M. H. Hudson, 58, Petherton Road, Highbury New Park, N., Mr. Joseph Pearce, 146, Aldersgate Street, E.C., and Mr. E. H. Jones, 44, Packington Street, N., all speaking highly of the "Ideal" and of Mr. Abraham's manner of doing business. The calls upon our space have prevented our publishing the letters in full.—Ed; AM; PHOT;

SIR,—In your last issue "J. R." sends you a complaint under the above heading. Firstly I may say that it is not the ordinary advertised "Ideal" at all, and also that he was not led to order it through seeing it at the Palace, as he states, for the simple reason that it was never shown there.

This camera is totally different to the "Ideal," it having different lens, different shutter, and is made to focus, so that were his remarks true, they in no sense whatever apply to the "Ideal"; and as I shall make no more like the one complained of, it is quite unnecessary to occupy space in refuting his statements. Besides, surely if anything was wrong he should have written to me, and not a letter to you for publication.

I may say that the insertion in your paper of such reckless and exaggerated complaints, written without the least responsibility, and by fussy and meddlesome persons who are thoroughly ignorant about what they write, and who are ever anxious to rush into print; whilst they can do little harm amongst reasonable

people, still tend to cause friction and unpleasantness in trade generally; and whilst, sir, you are endeavouring to protect buyers from sending their money to unreliable people who advertise worthless goods, I feel certain you will also be fair enough to protect established *bona fide* dealers from remarks which are intended unfairly to affect their reputation and to damage their trade.—Yours, etc.,

ROBERT ABRAHAM.

NOTE.—This paper is open alike to buyer and seller. We have consented that our correspondent shall bring his camera to our offices, and invite Mr. Abraham to meet him in our presence, and we shall then judge whether the statements are correct, and in either case shall uphold the right.—Ed; AM; PHOT;

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

(Continued from page 412.)

CHEMICAL equations are chiefly of value as concise representations of the results of experiment. They also often enable us to say beforehand that certain results will probably follow when certain substances are brought together; but it by no means follows that because we can write on paper an equation representing a seemingly possible reaction, therefore we can make that reaction take place. It is important to remember that the signs + and = have not their algebraic significance. Many chemical changes—e.g., those presented by the first and second equations—can be reversed under suitable conditions; but many reactions are not reversible, and therefore the two sides of a chemical equation are very often not interchangeable.

Equations, like symbols and formulæ, have a quantitative as well as a qualitative significance. The first equation tells us that one molecule of mercuric oxide, weighing 216 ($200 + 16$), yields one atom of mercury, weighing 200, and one atom of oxygen, weighing 16. The fourth equation tells us that one molecule of mercuric chloride, weighing 270.8 ($200 + 35.4 + 35.4$), and two molecules of potassium iodide, weighing 166.1 each ($39.1 + 127$), yield one molecule of mercuric oxide, weighing 327 ($200 + 127$), and two molecules of potassium chloride, weighing 74.5 each ($39.1 + 35.4$). A large figure placed in front of the formula of a compound, as in the fourth equation, denotes so many molecules of the compound—e.g., 2AgNO_3 means two molecules of silver nitrate; $5\text{K}_2\text{Cr}_2\text{O}_7$ means five molecules of potassium dichromate.

Since formulæ and equations have a quantitative significance, and denote certain definite relative quantities of the original substances and the products, it follows that if once we know the equation representing any reaction, and know the atomic weights of the elements concerned, we can easily calculate the quantities of the materials which we must take in order to obtain a given weight of the products. Such calculations are often required.

EXPERIMENT 29.—Dissolve 1.8 gramme of silver nitrate and 1.2 gramme of potassium bromide separately in small quantities of water (10 c.c.), and mix the two solutions; a yellowish-white precipitate will form, and will darken in colour if exposed to the light. Filter off this precipitate, and carefully evaporate the filtrate until a thin crust begins to form on the surface, and then set it aside to cool. After a time, long needle-shaped crystals will form in the liquid.

The precipitate is silver bromide; the substance in the filtrate is potassium nitrate. It is found that the result can be accurately represented by the equation—

Suppose we want to know how much silver nitrate and potassium bromide will be required to produce 10 grammes of silver bromide. The equation tells us that 179.9 parts of silver nitrate produce 187.9 parts of silver bromide; therefore—

$$187.9 : 10 :: 179.9 : x \text{ (Silver nitrate required).}$$

It also tells us that 119.1 parts of potassium bromide are required to produce 187.9 parts of silver bromide; therefore—

$$187.9 : 10 :: 119.1 : x \text{ (Potassium bromide required).}$$

Suppose also we want to know how much potassium nitrate will be formed at the same time. The equation tells us that when 187.9 parts of silver bromide are formed, 101.1 parts of potassium nitrate are also produced; therefore—

$$187.9 : 10 :: 101.1 : x \text{ (Potassium nitrate found).}$$

Calculate how much oxygen can be obtained from 500 grammes of mercuric oxide.

Calculate how much mercuric chloride and potassium iodide will be required to produce 100 grammes of mercuric iodide. How much potassium chloride will be formed at the same time? Keep in mind the significance of the figures before the formulæ in this equation.

Although our chemical equations convey so much information, they are by no means perfect representations of chemical changes. The equation for Experiment 29 does not tell us that the silver bromide is precipitated whilst the potassium nitrate remains dissolved; the equation for Experiment 24 (p. 215) does not tell us that the change involves an expenditure of heat; that of Experiment 26 (p. 215) does not tell us that the decomposition requires an expenditure of electricity; that for Experiment 22 (p. 177) does not tell us that heat is necessary to start the reaction, but when once started the reaction itself develops a large quantity of heat. The equations, in fact, tell us only the composition and relative weights of the original substances and the products; they tell us nothing about the conditions under which the reaction will take place or the outward and visible signs which accompany it.

We will now proceed to study in detail the more important chemical elements and their compounds.

OXYGEN.

Oxygen is the most abundant of all the elements. We have seen (Experiment 26) that it exists in water in combination with hydrogen. It is found to constitute, in combination with metals, carbon, and silicon, about half the solid crust of the earth; and we shall find that it exists in the free or uncombined state in the atmosphere.

It is now obtained in large quantities from the air by a method which will be described subsequently. On a small scale it is usually obtained by the action of heat on some substance which contains it. In Experiment 24 we obtained it by the action of heat on mercuric oxide; in Experiment 25 we obtained it by heating potassium chlorate. Repeat this experiment.

Potassium chlorate is a compound of one atom (39.1 parts) of potassium, one atom (35.4 parts) of chlorine, and three atoms (48 parts) of oxygen, and it has the formula KClO_3 . When strongly heated it loses all its oxygen and the white solid which is left behind, and which gives a dense curdy precipitate with silver nitrate, is potassium chloride, KCl , a compound of one atom of potassium and one atom of chlorine. The following equation represents the decomposition:

Potassium chlorate = Potassium chloride + Oxygen.

When potassium chlorate is employed alone, it has to be so strongly heated in order to produce complete decomposition that a glass vessel is partially softened and injured.

It is found, however, that if the chlorate is mixed with certain other substances, it will give off its oxygen much more easily. One of the most convenient of these is manganese dioxide, MnO_2 , often called black oxide of manganese.

EXPERIMENT 29.—Fit two similar test tubes with corks and glass tubes bent at a right angle, the limb of each tube which fits into the cork being about 5 cm. (2 inches long), and the other limb about 15 cm. (6 inches.) Arrange the test tubes so that their ends rest close together on a sand tray, whilst the ends of the delivery tubes just dip under water in a small vessel. Into one tube put 5 grammes of powdered potassium chlorate, and into the other put the same quantity of chlorate ground up with one gramme of manganese dioxide. Heat the sand tray on which the test tubes rest in such a way that the two tubes are equally heated. At first bubbles of gas will issue from the ends of both delivery tubes. After a time, however, this will practically cease, but as the heating is continued, gas (oxygen) will begin to come off from the mixture of chlorate and manganese dioxide, and will continue to be evolved until all the chlorate has been decomposed. Very little oxygen will come off from the tube containing the chlorate alone until it is very strongly heated.

N.B.—Manganese dioxide is sometimes adulterated with charcoal or other combustible substances, which make explosive mixtures with potassium chlorate. A new sample should therefore always be tested by mixing some of it with potassium chlorate, and heating a small quantity of the mixture on the end of an old knife, or in a small crucible. If it does not explode or enter into violent combustion, the dioxide may be safely used.

(To be continued.)

The Electric Light and Photography.—V.

By T. C. HEPPWORTH, F.C.S.

ANOTHER simple and convenient help to the electrical experimentalist is afforded by the little catch which is used by jewellers for fastening necklaces, bracelets, etc. These can be bought by the dozen for a few pence in Houndsditch and other thoroughfares which seem to be given up to the requirements of the seller of cheap jewellery. I need hardly say that they are not made of gold, but of brass, but they form a very ready and convenient means of joining together temporarily wires in electrical experiments. The form of catch is shown at fig. 1, and the ends of the wire to be joined should be terminated with the two pieces of which it is formed, and they should be attached by solder. At the house of a great electrician I lately noticed that the flowers and other decorations on the dinner-table were interspersed with glow-lamps, some of them being under water in the glass vessels, in which the flowers were placed. At first it was difficult to see how any electrical connection could be made between these lamps and the main wires below the table, without any visible break of the table-cloth. I was afterwards shown that this necessary connection was brought about by copper needles, which formed the terminals of the glow-lamp wires, and which were pricked through the cloth, and were then held by these jewellers' catches or clasps.

It is not difficult to make an electric battery which shall be able to illuminate a few glow-lamps of small size, and, as already indicated, one of the most convenient for the purpose is that using a single fluid, such as the bichromate cell. Roughly speaking, a single cell, with plates, having each a surface of about eight square inches, will illuminate a glow-lamp of 2-candle power. A convenient size for the plates

FIG. 1.

is 4 + 2 inches, and each cell will require one zinc and two carbons.

Both the carbon and the zinc plates will require some preliminary treatment before they are finally fixed to the wooden support. The carbon plates must receive a coating of paraffin wax on their upper ends, so as to prevent the battery solution creeping up by capillary attraction and corroding the metallic connections. The best way to apply the paraffin—an ordinary paraffin candle is the most handy thing to employ—is to heat the carbon plate upon the top of a stove until it is hot enough to melt the wax. The candle should then be rubbed across its upper part, after a sheet of paper has been bound round the plate, so that its edge shall mark a boundary line. This

FIG. 2.

line should be a little more than one inch from the top edge of the plate. Both sides of the carbon, as well as the edges, should be treated with the paraffin above this line, and just enough should be applied to fill in the pores on the surface, any surplus being wiped off. If too much paraffin be applied where the connecting strip of metal touches the plate, it will act as an insulator, and the current will not pass. It is therefore as well to scrape this point of junction with a blunt knife, so as to remove any wax which may have escaped the wiping process.

The zinc plate must be amalgamated with mercury, or there will be local action which will most surely reduce the power of the cell, as well as shorten its life. To make the mercury form an amalgam with the surface of the plate, the latter must first of all be dipped into dilute sulphuric acid, one part of acid to eight of water. The mercury may then be rubbed on to the zinc, a few globules at a time, by means of a stick, with a little flannel rolled round its end, or the vessel containing the dilute acid may have some mercury put into it, and when the zinc is placed therein the mercury will attach itself to the lower part of the plate. The zinc can then be removed and placed, the other way up, against any suitable support, when the mercury will gradually run down both sides, and will amalgamate them without further trouble. But generally a little after-manipulation with the rubber becomes necessary to persuade the mercury to cover certain spots which it is apt to leave uncoated. The top of the zinc plate should be coated with black japan, to a depth similar to that of the paraffin band on the carbons.

FIG. 3.

containing vessels, as shown in the illustration of the complete cell at fig. 3. The support is made of hard wood

and is in two pieces, each of which is recessed for the reception of the plates. When they have been correctly cut and fashioned as shown, they should be heated and covered with a layer of paraffin wax. The best way is to have a bath of the melted wax of sufficient capacity to hold the wooden pieces, and to allow them to soak there for ten minutes while heat is applied to the containing vessel. When this is done, the zinc plate should be attached by short wooden pegs to the wooden piece having the double recess, while at the same time the copper connecting strip should be inserted between the metal and the wood. Care should, however, be taken to scrape away the japan at this point, so as to afford good metallic connection between the two. The two wooden pieces may now be screwed together as shown, and the carbon plates attached to either side, not forgetting the copper bridge which connects the two, and the slip of copper which projects, and which is to serve as a connection for wires, or for other cells if more than one is to be employed.

For plates of small size the cell or containing vessel can take the form of a common glass tumbler, such as can be bought for about twopence. But most workers will prefer to employ plates of larger size than these will contain, and will use a salt-jar, such as is shown in fig. 3, for this purpose. These jars have the merit of being uniform in size and very difficult to break.

(To be continued.)

THE Providence Camera Club sends us a copy of the catalogue of its sixth annual exhibition of the work of the members of the Club. The booklet is very nicely got up, and contains a photographure of the prize picture of 1889, and a good process reproduction of a flashlight picture of the night-blooming Cereus.

A NON-ACTINIC SOLUTION.—An aqueous solution of 3 parts of green chloride of nickel and one part of red chloride of cobalt appears colourless by transmitted light, and when diluted perfectly water clear. Light passing through the solutions of either of these substances, says the *Photographic Times*, does not affect the salts of silver, neither has it actinic properties when passing through the mixture, notwithstanding it is perfectly white. Sensitised paper exposed to such light for more than a week had not changed in the least.

CORRECTION.—Mr. A. Brooker, Hon. Secretary of the Hastings and St. Leonards Photographic Society, writes:—"Your District Editor, in his 'Notes from the Liverpool Centre,' mentions Mr. F. Anyon as 'a prize winner at Hastings.' I suppose the expression can only convey the idea that the gentleman was awarded his prize here, but as no one of that name was an exhibitor at our recent exhibition, I think some error has been made."

NOTE.—Our District Editor has possibly mixed up the matter of Mr. Anyon's prizes. He received an award in our recent "Prize Tour Competition."—Ed. AM. PHOT.

A SHIPWRECKED PHOTOGRAPHER AT WORK.—The Rev. A. H. Blake, President of the Windsor and Eton Scientific Society, who is an enthusiastic member of the Photographic Society, is now making a tour of the Channel Islands. He crossed over from Weymouth on the morning of June 10th, in the Great Western steamer *Antelope*. It will be remembered that on arriving near Guernsey, the steamer ran on the rocks off the Island of Herm; the passengers were landed on some rocks awaiting the rescue boats from Guernsey. Mr. Blake lost no time in getting out his camera, and having succeeded by various devices in extemporising a dark-room, loaded his slides and took shots at the wrecked company and steamer; such was his success that the *Daily Graphic* in last Saturday's issue reproduced the scene. We would advise all amateur photographers to charge their slides before embarking on a voyage, as in these days of instantaneous photography many interesting pictures can be obtained if the apparatus is ready; and it is not every one who will have nerve enough to coolly photograph a "shipwreck" in which he has been personally interested.

Photographic References.

By MAJOR J. FORTUNÉ NOTT.

HAND-CAMERAS.

(Continued from page 414.)

AN examination of the tables previously given will be sufficient to show the necessity for having lenses on hand-cameras of comparatively short focus, when no means of adjusting the focus exists other than by guess work. As, however, the pictures resulting from their use do not commend themselves, in consequence of the angle embraced being sufficiently wide to give the perspective a distorted appearance, and the distinction in size between near objects and those but a short distance further away exhibiting a disproportion in size which appears unnatural, the advantages to be gained, from an artistic point of view, by employing lenses of longer range is made evident, and not only are pictures produced by their aid which are more pleasing to the eye than those resulting from lenses in which an apparent falsity arising through their optical construction is evident, but in their use the only means of obtaining with a hand-camera the photograph of objects with size sufficient to render them distinct under ordinary conditions appear to exist. Of course, by having the principal object it is desired to take, as close as the focal length of the lens will allow, fairly sized images may be procured. But this necessity limits the available powers of the hand-camera, for it is not practical or even possible, neither is it desirable, that the photographer should have to approach objects so close as this scale of distances necessitates in order to accomplish his object.

The subject of size being an important one for the users of hand-cameras who desire to produce photographs in which certain details are given boldly and not rendered in a finicking microscopic manner, the following tables are

Man, 5ft. 9 ins. in height, standing at the undermentioned distances:	Size on plate, with a lens whose focal length is 3 ins.	Size on plate, with a lens whose focal length is 3½ ins.	Size on plate, with a lens whose focal length is 4 ins.	Size on plate, with a lens whose focal length is 4½ ins.	Size on plate, with a lens whose focal length is 5 ins.	Size on plate, with a lens whose focal length is 5½ ins.	Size on plate, with a lens whose focal length is 6 ins.	Size on plate, with a lens whose focal length is 6½ ins.	Size on plate, with a lens whose focal length is 7 ins.
Yds.	In.	In.	In.	In.	In.	In.	In.	In.	In.
10	1½	1½	1½	1½	1	1½	1½	1½	1½
15	1	1	1	1	¾	1	1	1	1
20	¾ apx.	¾ apx.	¾	¾	¾	¾ apx.	¾	¾	¾
25	¾	¾	¾ apx.	¾ apx.	¾	¾	¾	¾ apx.	¾
30	—	¾	¾	¾	¾ apx.	¾	¾	¾	¾
35	—	—	¾	¾	¾	¾	¾	¾	¾
40	—	—	—	¾	¾	¾	¾	¾	¾
45	—	—	—	¾	¾	¾	¾	¾	¾
50	—	—	—	¾	¾	¾	¾	¾	¾

appended. These figures have been compiled for the purpose of showing the gradation of size at varying distances given by the lenses of different focal lengths. A man five feet nine inches in height has been taken as the standard, and, of course, by means of multiplication or division the size of every other object of known height at equivalent distance can be easily calculated.

From this table it becomes evident that, broadly speaking, every half inch beyond three inches added to the focal length of the lens increases the size of an object as large as a man by $\frac{1}{16}$ of an inch; and again, that with a lens 7 inches in focal length a man may be 50 yards away and be about the same size upon the plate that at only 20 yards distance he would be were a lens employed only 3 inches in focal length. This clearly demonstrates the great advantage to be derived from having the longest focal lengthed lens on a hand-camera that its extending movement will permit.

But, as before shown, in order to ensure sharpness in the negatives resulting from its employment, a means of accurately focussing must exist. Now this can only be done by resorting to the ground-glass screen. In certain forms of hand-cameras now on the market this method of focussing is adopted. It is either accomplished by an interior arrangement which reflects the light from the lens upon a mirror until the plate is on the point of being exposed, or in a manner better still, in some respects, by means of dual lenses accurately paired, which move together upon the same rack-work. In this latter form there is, of course, less chance of fogging the plate or of jarring the camera by the jerking movements the working of the interior arrangements render almost unavoidable which exist in the other form. Undoubtedly, the advantages to be derived from the focussing-power cameras of this description confer will in time become so obvious that simple devices for accomplishing the desired object will be considered a *sine qua non* for any camera which is designed for serious work, as opposed to those manufactured to furnish toys for grown-up children.

If, however, the camera does not possess the power of being focussed by means of a screen, a view-finder of some description should be regarded as a necessity. For not only does it enable the operator to regulate the balance of his picture and to give the principal object its correct position, but it also can be made the means of assuring the perpendicular and horizontal lines being correctly parallel. Failure in paying attention to the necessity for holding the camera perfectly square will lead to the production of pictures of a worthless character, in which buildings are unnaturally dwarfed or appear to be built in a tapering fashion. As the hand cannot be made to hold the camera correctly without some guide, and as watching a small level attracts the attention from the view at a time when no distracting element should exist, by all means let the photographer learn to do all that is necessary by means of the view-finder. To enable this to be successfully accomplished, the screen of the finder in which the view is reflected should be of fair dimensions and have faint lines ruled across it, whereby the lines in the picture, running in the same directions, can be made to correspond in correct parallels.

A similar means of producing the same result can be adopted in a hand-camera that possesses the focussing arrangement to which we have before referred, but therein, of course, the screen itself acts as a view-finder, and enables all that is necessary in producing excellent work to be accomplished with the utmost simplicity.

(To be continued.)

NORTH MIDDLESEX PHOT. CLUB.—The ordinary meeting was held on the 9th inst., Mr. Walker in the chair. Mr. G. J. Clarke delivered a lecture on "Photographic Optics." He first described the action of light when entering or leaving one medium of different density to another, so as to make quite plain the action of lenses, and afterwards discussed the defects incident to different lenses, and the means by which they were overcome, illustrating the lecture by means of well-drawn diagrams. A vote of thanks to Mr. Clarke concluded the meeting. On Monday, June 23rd, Mr. W. T. Goodhew will open a discussion on "Development."

Photographic Hints for Beginners.

By C. LYON.

"PRACTICE makes perfect" is an old saying and a true one. Although photography has been wonderfully simplified within the last few years, so much so, indeed, as almost to have been reduced to a mere mixing of two or three chemicals, yet practice is still necessary if we would excel in the art of producing "sun pictures."

Beginners will find that they fail quite as often as they succeed, and what they have first to learn is the cause of their numerous failures. They have followed to the letter the instructions given them, and yet the results are not satisfactory. The negatives are fogged, or they are so thin that there is very little difference between the high lights and the shadows, or else they are so dense that it is difficult to make out the detail.

It is easy to see when a negative is bad, but it is often difficult to find out what is the matter with it; in other words, the plate has been spoiled somehow, and we have got to find out how. If it is fogged, it is probably because light has got to it before or after exposure. If it is "thin," that is to say, lacking in density, it is either over-exposed or too quickly developed; if it is "hard," which means that it prints too black or white, or without detail, it is either under-exposed or over developed, or else, perhaps, too much restrainer has been used in the developer. Experience gained by practice will generally enable one to tell at a glance wherein the fault lies, and, of course, to avoid it in future.

I am writing for beginners, and trust that my hints may help them through most of the difficulties which they are sure to encounter when they first go in for photography.

I will begin by saying a few words on the all-important question of—

Exposure.—What exposure ought I to give? is asked by every beginner, and it is a question that it is by no means easy to answer. We are informed by the maker of the plates we have decided to try, that they correspond to the sensitometer No. 18, or 26, or whatever it may be; but, as beginners, that tells us nothing. We are not even sure whether the plates labelled 26 are twice as rapid or three times as rapid as those labelled 18. We might, indeed, argue that as 26 is not quite $1\frac{1}{2}$ times 18, so the 26 plates could not be more than half as rapid again as the 18 ones. But if we exposed our rapid plates in accordance with this not unnatural assumption, we should certainly spoil them. It seems to me that some standard should be adopted, and plates should be tested and labelled in accordance with this standard. We have adopted a standard "light-measure," which has, I believe, been fixed by Act of Parliament; why should we not have a "standard of rapidity," if I may be allowed the expression, for our dry plates. It would be difficult to fix upon one, I grant, but I see no reason why it should not be done. A plate might be coated with a "standard" emulsion and exposed by means of an electric lamp of a certain power to be agreed upon beforehand. This plate might be called No. 1. Then all brands of plates requiring the same exposure, which could be determined by trial, would also be labelled 1. Slower plates would be labelled 2 or 3 or 4, etc., according to whether they required double or triple or four times the exposure. Faster plates, on the contrary, would be labelled $\frac{1}{2}$ or $\frac{1}{3}$ or $\frac{1}{4}$, etc., according to their rapidity. If this were done, amateurs would be saved an immense amount of trouble and many vexatious failures. We could find out the rapidity of the standard plates in our camera with the different stops, and we should then know what exposure to give to plates labelled, let us say, $\frac{1}{2}$.

As it is, we must find out by repeated trial what exposure is required with the different plates we mean to use. I strongly advise the beginner not to offer to take his friend's house or garden, or to set off on a tour with his camera, until he has practised at home. Failure is always disheartening, and it is especially so when you have taken photographs which you are most anxious should turn out well. I know few things more annoying, when you have taken a group of your friends, say at a picnic, and promised each sitter a copy, than to have to inform them afterwards that the negative is bad. Some one is sure to tell you that at the last picnic *she* was at, *he* took such a lovely view of the party, and every one came out so well, etc., etc. Guard against such annoyances as this by never proposing to take your friends until you have gained such experience at home as to be almost certain to succeed. You will then be the one who took the "lovely view" in which "every one came out so well."

Most beginners over-expose at first, and then go to the other extreme and under-expose. The former error is better than the latter, as an over-exposed plate may, by judicious development, be made into a very fair negative, whereas a plate that is much under-exposed is really useless, as the detail is lost and cannot be forced out afterwards by any process at present known. Beginners cannot do better than practise by taking a number of photographs at different hours of the day, and with stops of different sizes. They will learn more in a short time in this way than by the perusal of whole pages of "Instructions." But they must record the results of their experiments in what may be called an Exposure Book. Every one should keep an exposure book, and it might be arranged somewhat as follows:—One side of the page should be reserved for bright subjects, the other for dark ones. We should note under the heading "Day" whether it was dull or bright, and record the hour, lens, stop, exposure, and remarks—such as over or under exposed (thus + or —), and by about how many seconds it is too much or too little exposed. A better plan would be to print a copy of each negative, stick it into the book, and record under it the month and time of day when it was taken, the lens and stop used, and how it was developed. I am supposing that only the one brand of plates is used; if different brands are tried, of course, the kind of plate must also be noted, as well as the developer employed. One end of the book might be kept for summer exposures, and the other end for winter ones; each end being labelled respectively "Summer" and "Winter." I have only to add that when you are in doubt about your exposures be sure that you give sufficient. If you are taking something that you are very anxious should turn out well, take two (preferably three negatives) of it. Expose one, as nearly as you can guess, correctly, and the other a little longer (and if you have taken a third one, expose it a little less than the first). Develop the former first, and it will enable you to judge how to develop the second (and third), which will very likely be the best. Print them and keep the best.

In practising, to find out the correct exposure, all the plates must be developed in the same way; but as soon as you have gained some experience in exposing you can turn your attention to your developer. Experimentalising with different developers is as amusing as it is useful, and you may rest assured that no one who does not work out the theory of development for himself by actual experiment will ever be a great photographer.

Development must therefore now claim our attention for a time, and to begin you may try the following experiments. Take six photographs of the same subject one after another, using the same lens and stop, and, of course, without moving the camera. Let two be slightly under-exposed, two

over-exposed, and two correct. Develop one of each in the same pyro and ammonia developer which I will suppose you have been using for your exposure experiments. The over-exposed plate will begin to come out first, and will soon be sufficiently developed. The correctly exposed one will come out next, gradually, but sharply, and should take two or three times longer than the other; then, lastly, the under-exposed one will begin to show, the sky and any white objects looking like black or rather very dark patches, and the shadows and badly lighted parts coming out very slowly or not at all. When developed and cleared (fixed), take the three negatives out to the light and compare them. Then proceed to develop the other three, beginning, we will say, with the over-exposed one. You should have your bromide solution (restrainer) in one bottle, your ammonia solution (accelerator) in another, and your pyro dry, that is to say, in powder. But to save trouble in weighing out small quantities of the powder you can make a concentrated solution of pyro for each day's use by dissolving say 32 grs. in 2 ozs. of water (preferably distilled water); each drachm of solution will then contain 2 grs. of pyro, and to make a two-grain solution you have only to put out 2 drms. into a 2 oz. measure glass and fill it up to the 2 oz. line with water.

Now, for your over-exposed plate you must make up a developer with more pyro, the usual quantity of bromide, and no ammonia. You have probably been working with a $1\frac{1}{2}$ or 2 grs. developer, that is, $1\frac{1}{2}$ or 2 grs. of pyro to the ounce; you must now use $2\frac{1}{2}$, 3, or even 4 grs. to the ounce, according to the amount you believe your plate to be over-exposed. A 3 grs. solution will probably be enough for your present purpose, and 2 grs. of bromide. Leave the plate in this for a couple of minutes; then begin to add the ammonia solution in very small quantities at a time, and allowing an interval of some seconds between each fresh addition of the ammonia. You may, in fact, add it drop by drop if the plate is much over-exposed. The result will be that you will get a negative almost if not quite as dense as the one that was correctly exposed.

Now develop the under-exposed one by using rather less pyro than usual less bromide, and more ammonia, or else use a hydroquinone developer, the advantage of which is that a negative can be left in the developer if necessary to force out the detail longer than it could be with pyro and ammonia, which stain the film after a time, and seem unable to force it out beyond a certain point. In cases of known under-exposure it is not a bad plan when developing with pyro and ammonia, to immerse the plate first in a *weak* solution of ammonia to which a small amount of bromide may be added, and then make up a developer with a full allowance of ammonia and somewhat less bromide. This should bring out the details if it be not hopelessly under-exposed. It is often an advantage if the detail comes out sluggishly even after a good deal of ammonia has been added to make up a fresh developer, using, of course, a slight excess of ammonia. By this means you may avoid staining the film.

You can next develop the other correctly exposed plate, using for the purpose a developer similar to the last, that is to say, with a minimum amount of bromide and a maximum amount of ammonia. When these three negatives are finished, print off a copy of each for comparison. The second correctly exposed one will probably be as flat as the first over-exposed one, and will appear to have been more exposed than the over-exposed one which was kept back in the developing. This simple experiment will prove conclusively how much may be done by judicious developing. Of course the over-exposed negative can be intensified; but it is seldom that an intensified negative is quite as good as one that does not require intensifying.

I may add that before you begin to develop, you should have everything you are likely to require ready and near at hand. See that your dishes and measure glasses are clean, have your fixing bath made up, and make sure that there is no hypo on your fingers. Do not get impatient if your picture does not begin to appear as soon as you think it ought. Some of the best pictures come out slowly and would be spoilt if hurried in the developing. The slower the development the greater the contrast; but of course there is a medium in all things, and the development must not be too slow, or the negative will in all probability be injured. The rule to be remembered is—fast development and soft thin negatives; slow development and bright more or less intense and good printing negatives.

Fog.—When your plates are found to fog, you may almost take it for granted that actinic light has got to them either before or after exposure, or possibly during development. How have they "caught the light"? That is what you have to find out, and you had better begin by examining your dark-room. Go in and shut the door, put out the light, and, standing in the middle of the room, wait for a couple of minutes to let your eyes get accustomed to the darkness; then look slowly round, when, if light gets in, you will be sure to see it.

Next try your camera, and to do so without wasting a plate take it out of doors, screw it out as far as it will go, put in the lens, and cap it; then take out the focussing glass, and holding up the camera (in the sun, if possible; at any rate, in a strong light) so that you can see into it, put a dark cloth (a rug will do well) over your head and over the end of the camera, and tuck it round in such a way as to shut out the light. Wait a minute or two, as before, to accustom your eyes to the darkness, and then move your camera about, keeping the cloth over it and facing the sun if possible. If it is not light-tight, a bright ray will be seen to flash in as you move it, and, of course, it will then be necessary to find out where it comes from, which is not very difficult. If you have been using a shutter, you can test it in the same way by putting it on, instead of the cap. The light is almost certain to get in by the slit in the lens-tube for the stops. Some use an india-rubber band for shutting it out; but a safer plan is to bind a cloth round the lens and stop. A good-sized handkerchief will do, and the india-rubber band may be used to keep the handkerchief tight.

Having ascertained that the light does not get into the camera, you can next try the carriers, or "double-backs," as they are sometimes called. To do this you must sacrifice a couple of plates (small ones will do) for each carrier to be tried. Put the plates in and take the carriers out into a good light. Leave them exposed to the light, first one side and then the other, for a short time, and then develop and clear the plates, being careful to remember which carriers they were exposed in. If any are fogged, you will know that the corresponding carriers are not light-tight, and in all probability a careful examination of the same will reveal the defect where the light gets in. To find out whether the light enters between the camera and the carrier, put in a plate and slide the carrier into its place in the camera, cap the lens, and draw out the carrier-slide. Leave the camera a couple of minutes in a good light, and then develop and clear the plate, when, of course, if the light has got in it will be fogged. I should explain that a plate quite free from fog will be almost as clear as plain glass; the gelatine film on removal from the hypo will be just visible through the light. If left some time in the developer, it may get stained, but this can generally be distinguished from fog.

We must remember that all light, even the most non-actinic,

is more or less harmful to gelatine plates, especially to the very rapid ones, and therefore we should not expose them more than necessary to the lamp, or whatever light it is we are using. In putting plates into the carriers do not hold them near the lamp and do not keep them out in the room longer than you need. In developing, it is an advantage to have a piece of stiff brown paper or cardboard to lay over the developing dish when you first put in the plate. My plan is to invert a spare developing tray, a size or two larger than the one I am using, over it. With this tray over my negative I can uncover the light with perfect safety. In a word, you cannot be too careful after as well as before exposure.

Plates are sometimes fogged by carelessness in removing and replacing the cap. It must be slipped off and on as quickly as possible.

In conclusion I would advise you always to time your exposures with a watch. Many photographers guess the time, but it is not a good plan. There is almost always a very great difference between, say, ten seconds as shown by the second hand of a watch, and the same time as computed by counting. In photography, guess work does not answer.

Notes from the Liverpool Centre.

(By our District Editor.)

By the time this issue of the AMATEUR PHOTOGRAPHER is in print, in all probability the steam yacht *Myrtle*, which is to convey the party, including Mr. Paul Lange, to Iceland, will have come round to Liverpool. Mr. Lange's outfit, of which I have seen the greater part, is most complete. It includes his own camera, with special appointments and trappings, a handy changing tent on the umbrella principle, and many other articles of equal importance to the success of the undertaking, at least, so far as the photography is concerned. In Mr. Lange's party will be Mr. R. Talbot Kelly, an artist of the front rank commissioned by the *Graphic* for a series of pictures illustrating Iceland, and Mr. James D. Eastham, journalist. Mr. Geo. Thordahl, the promoter of the Iceland enterprise, is proving himself a vigorous and urbane organiser. The *Myrtle* sails from Liverpool next Thursday, 26th inst.

The correspondence between Mr. C. B. Reader, of the Birkenhead Society, and Mr. J. H. Pickard, of the Birmingham Society, has caused much comment in and about the Liverpool centre. The burden of opinion is that, notwithstanding Mr. Pickard's lengthy communication which appeared in the AMATEUR PHOTOGRAPHER of the 6th inst., Mr. Reader is really right in his contention. The survey of the Hundred of Wirral was most thorough, embracing studies archeological, architectural, ethnological, geological, historical, and the rest, giving complete details in every section. Local scientists, litterateurs, historians, and antiquarians were employed in the survey, no effort being spared in the undertaking. The survey was not "piecemeal work," it was wholly comprehensive, the first of its kind practically undertaken by an organised body, and certainly the first photographic survey fully presented to the public. But I understand that Mr. Reader is himself writing you again in the matter. I have merely given the opinion of photographers up here as I have collected it.

At the coffee meeting of the Liverpool Society held on Wednesday last week, Mr. F. Anyon showed, among other novelties, an ingenious rocker moved by clockwork. The movement can be regulated faster or slower, at will. Mr. Stanistreet exhibited several very fine glass transparencies. He has lately devoted himself to the stereoscopic department of photographic work with flattering success. Mr. Lange showed some of the apparatus for his tour in Iceland. There was a good attendance.

Owing to the Chester Convention, the ordinary meeting of the Liverpool Society will be held this week. Mr. Beaton (J. J. Atkinson's) will exhibit Fallowfield's Facile camera, and Mr. H. H. Smith (Eastman Company) will give a demonstration with the new Kodak camera and rollable transparent film. Five new members are to be elected.

Science Notes.

THE Eastman "rollable" film consists of celluloid, which is made by dissolving a mixture of gun-cotton and camphor in methyl alcohol and amyl acetate. This solution is filtered through fine cotton-cloth, and is then poured upon a table of plate glass which has been previously rubbed over with beeswax. The surface of the film so obtained is somewhat greasy, so it is washed with water containing a little silicate of soda. When dry it is coated with emulsion, dried again, and finally cut up into long strips and wound on rollers. Its thickness is from the two-hundredth to the three-hundredth part of an inch.

Perhaps those who have used this "rollable" film may have noticed one or two straight lines running parallel to the length of the film. We find these to be due to the brass wire springs of the roll-holder, which press on the film and make a mark in it as it revolves. The roll of film seems to be a trifle thicker than the previous paper rolls, for they were not affected in this way.

The famous French astronomer, M. J. Jansen, has been photographing the telluric (or atmospheric) lines in the solar spectrum by the aid of Isochromatic plates, a Rowland grating, and the pure air of Algeria.

Possibly the resolve alluded to in our last week's "Notes," to appoint four ladies as photographic assistants in Greenwich Observatory, may be due in part to the excellent work done in America last year by Miss Maury and Mrs. Fleming in connection with the Henry Draper Memorial Scheme for the photographic study of stellar spectra. A distinguished astronomer writes of the work of these two ladies: "It is eminently worthy of record that Miss Maury has studied and classified the spectra photographed with the 11-inch telescope, and that the discovery of the duplication of the lines in β Aurigæ, and the bright lines in the spectra of Pleione and π Aquarii, were also made by her; while nearly all the measures of the photographs taken with the Bache and Draper 8-inch telescopes were made by Mrs. Fleming, under whose direction the computation and preparation of the catalogue of 10,000 stars has also been made."

The "Spencer War Balloon" has been ascending from the Royal Military Exhibition, and a number of photographs have been secured from it with Shew's "Eclipse" camera, the silver lining of the clouds with the shadow of the balloon as projected by the sun forming a most interesting subject.

M. P. Lenard writes to *Nature* stating that he succeeded in photographing, some years ago, the falling drops of water recently photographed by Mr. C. V. Boys. Copies of M. Lenard's photographs appeared in the *Annalen der Physik und Chemie* for 1887.

Mr. Shelford Bidwell delivered a lecture at the London Institution, on February 10th, on "Electrical Phenomena in Nature," in which he states bluntly that "the lightning flash of artists which is familiar to us from innumerable pictures, and of which a venomous-looking zig-zag is a fair example, *has no existence in nature*;" and he adds that "photography has given the coup de grace to the traditional forked lightning."

Mr. Bidwell thinks that the mystery of the "dark flashes" of lightning sometimes obtained on a photographic plate has been "completely cleared up" by the researches of Mr. Clayden, who finds that "if the lens of the camera be covered the moment after a flash has occurred, the developed image will always come out bright, feebly or strongly, according to circumstances. If, however, the plate be exposed after a flash has acted upon it, either to the continued action of a feeble diffused light, or to the powerful glare arising from one or more subsequent flashes, then on development the image of the original flash will probably come out black."

As this is the "thunderstorm season," we earnestly hope that dark-slides will be kept "ready charged," and that no opportunity will be lost of securing valuable records. During the daytime the uncertain occurrence of the lightning-flash makes it difficult to photograph; but at night it is only necessary to point the camera in the direction of the thunderstorm, uncapping the lens, and then capping it again directly after a flash has occurred.

The *Star* last week contained some reproductions of instantaneous photographs taken by Mr. O'Brien with a Kodak, illus-

trating the "shadowing" of patriots in the Emerald Isle by the police. Varied are the uses of photography!

The use of celluloid films ought to make more possible the formation of a club for the circulation of negatives. Films travel so safely and inexpensively by post that a dozen or twenty workers in different parts of the kingdom could secure a varied collection of prints and lantern-slides with great ease by this plan.

F. G. S.

Holiday Resorts and Photographic Haunts.

VENTNOR AND NEIGHBOURHOOD, ISLE OF WIGHT.

By WENTWORTH A. J. CROKE.

VENTNOR has been rightly termed the English Spa; it is most peculiarly built in terraces and helps to remind one of a town on the Riviera. It is indeed a lovely spot, answering exactly both to a holiday resort and photographic haunt. The cliffs are especially fine all along the sea-coast, and lend themselves most readily to photography. It has a wonderful climate, being warmer in winter, but cooler in summer, than any other place; consequently it is a great health resort, although many people think that seeing so many invalids about gives an element of sadness to this otherwise perfect place. Ventnor is decidedly the best place in the Isle of Wight to make a centre, as most other parts of the island are within easy excursions either by road or rail. It is not an easy place to get to from London—far from it; you go from Waterloo to Portsmouth (London and South-Western Railway, or London, Brighton, and South Coast), from Portsmouth to Ryde by boat, and from thence to Ventnor by the Isle of Wight Railway. But let me caution my readers before starting to make sure that there is a boat to meet the last train from London at five, getting to Portsmouth at 7.15, as a boat is only run to meet that train in the summer months, and one is apt to find one's self landed at Portsmouth for the night. Ventnor is essentially a place of hotels, but lodgings generally are cheap—at least, that has been my experience. Several of the hotels have dark-rooms attached to them, viz., the Crab and Lobster, which has the original old inn of one storey still standing by its side; this was one of the first houses ever erected in Ventnor. Then there are the Queen's Head, the Royal Marine, and Rayner's Temperance Hotels; other hotels, of which there are several, I cannot speak with the same certainty. But those who are not staying at the hotels will find the dark-room of Messrs. Thompson, of Pier Street, the principal photographers of the town, at their service; here, also, plates are kept, though, of course, at a slightly advanced price to those of the same make to be obtained in London.

Ventnor, which is the capital of the Undercliff, was styled by Cuthbert Bede "A sunlit town that sits basking in the lap of nature and is mirrored by the sea."

Sir James Clark was the first medical man who drew the attention of all Britain to the advantages of Ventnor as a winter resort. The western esplanade—which is a favourite place of resort both in summer and winter—was formed round the cove in 1848. There is a fine pier, measuring 650 ft. long by 25 ft. broad; from the end of this many pretty views of the town and downs are to be taken. Following the beach westward for about a mile, you come to Steephill Cove. This cove is terraced with the most picturesque little fishermen's cottages, and are backed by the lofty downs, which form a shelter from the winter gales. Here some of the prettiest photographs it has ever been my pleasure to take are to be obtained. The shore is covered with fine shingle, known as "Ventnor Diamonds." The coast scenery near Ventnor is very varied and pretty, especially westward towards Steephill; near Bonchurch it is bolder and less picturesque.

Bonchurch is one of the oldest villages in the island. A good view of this little village is obtained from St. Boniface Down, which is 783 ft. above the sea; also the Pulpit Rock, which is well worth a visit. One of the most interesting spots here is the old church, which dates from 1070; here it was that St. Boniface is said to have landed. The churchyard, which is generally admitted to be one of the most lovely spots in England, has been closed to the general public through the inconsiderateness of excursionists. While at Ventnor a visit to St. Lawrence will well

repay the tourist; it is a distance of about two miles. On the summit of the hill is an ivy-covered church, originally the smallest in the kingdom, measuring only 22 ft. long, 11 ft. broad, and just over 4 ft. high. Another place that I must not forget to mention is Shanklin, a walk of three and a half miles: it is indeed a typical old English village; the cottages in summer are covered by honey-suckle and plants that flourish well in the open air. A mile and a half further on is Luccombe Chine, one of the prettiest spots in the whole island; it can be reached either by shore or cliff—if taking the former the tide should be noticed.

Other places of interest within easy distance from Ventnor are Appuldurcombe, Newchurch, Wootton, Newport, and Carisbrooke Castle. One of the best ways of seeing the island in a short space of time is to take a passage in one of the many coaches. One of the drives I can especially recommend is to go by Webber's four-horse coach that leaves No. 32, High Street, every day (Sundays excepted), at 10.10, returning to Ventnor at 7 o'clock, in time to catch the 7.50 train to Ryde. The coach passes Sandrook, Blackgang, Brixton, arriving at Freshwater Bay Hotel at 1.15, returning at 4 o'clock p.m. from Freshwater. In the journey three teams of horses are employed. The fares are—Freshwater return, 6s.; single, 5s. Alum Bay, return, 7s. 6d.; single, 6s.

There are many other excursions leaving the town at all times during the day. I only mention this one as embracing so many places.

Strangers will find "Wayland's Guide to the Isle of Wight, Portsmouth and Dockyard," with large map, useful for more minute details, historical and otherwise.

* * * *

IN AND AROUND BURNHAM.

By T. BAKER.

BURNHAM is situated at the entrance to the Bristol Channel, and being quite open to the Atlantic, is very bracing; but on account of the absence of trees near the shore, and the great expanse of sand, the heat at times is great. I have not one negative left of a series taken some years ago; but wishing for some, the following notes may be helpful to "W. H. W." or others who may be visiting Burnham.

There is no convenient dark-room available, but I arranged for one on a former occasion, and got on very well. Before taking a series of views at Burnham, the same rule applies there as at other places with regard to being all things to all men, and at Burnham especially, to all women as well, because the lengths of sand and road are frequently considerable, and by the exercise of a little tact on two occasions, ladies kindly consented to make a foreground—once a school added to what might have been a dull picture, and even the Burnham donkeys and bathing machines, not to forget the boatmen and boats, all willingly lent their aid. As to pictures—1. Go down the landing stage as far as you can, when there is a good light on the esplanade, and get a few boatmen's children, also dogs and donkeys, as a foreground, and you get a fine general view. 2. Half-way along the esplanade, near the church, taking care to choose a time when the seats along the wall near the entrance to the church are occupied. 3. Catherine and Julia Terraces, near the end, taking an opportunity when one of the schools are out, and if suitably asked, they will make a splendid foreground. 4. A very picturesque group can easily be arranged on the terrace steps, and shows well on a picture. 5. Take the bathing machines as a foreground, and the low lighthouse as a background, having as many figures as possible in between. 6. Over the hills, the high lighthouse from the Berrow Road makes a most unique picture. Then—7. Having asked permission, the entrance lodge to the "Colony" will be found to be a fine ivy-covered cottage, and—8. The Colony is also well worth a plate. 10. The trees at the entrance to the Berrow Road, with a horse and cart coming along—a grey horse, if possible—also make quite a picture, and 11. The best point for the church is from the town street, near the lawyer's office. 12. Do not forget the unsectarian adult school, which, although a new building, is one of the features of Burnham, and 13. I am told the cemetery makes a good picture. In the neighbourhood, Berrow should be the first walk, for, 14. Berrow Church, and, 15. Berrow village; then High Bridge, where, 16. the church, and, 17. the docks, are the main feature. Glastonbury, Brent Knoll, and various parts of the turf moor, such as Edington and Shapwick, are in easy distance. Any one calling on me at Clevedon, will be welcome to more information than the Editor would care to print.

Register of Dark-Rooms, 1890.

The following "Dark-Rooms" have been placed at our disposal. We class them in four divisions, *i.e.*, *a* amateur, *d* dealer or professional, *h* hotel, and *s* photographic society.

In our letter of introduction full particulars are given as to owner, address, charges (if any); plates, chemicals, etc., kept by dealers; terms for temporary membership of societies; hotels; distance from station, etc., etc.

Every application for letter of introduction must be accompanied by SIX PENNY STAMPS. The owner of "Dark-Room" will be advised by same post as the applicant. The envelopes should bear the endorsement DARK-ROOMS.

Societies' Meetings.

NOTE.—In this column the Editor can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editor will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BIRKENHEAD PHOT. SOC.:—The monthly meeting was held last Thursday, 12th. Mr. P. H. Phillips, President, filled the chair, the attendance being good. The work done in the recent outdoor competition was on view, and letters were read from the adjudicators, Messrs. R. Hartley and G. E. Thomson, announcing that in their opinion the set of pictures sent in by Mr. George

Latimer were the best. Mr. Latimer, therefore, receives the silver medal offered by the Association. The winning set was greatly admired, as much for the exceptionally novel and artistic manner in which they were mounted, as for the high point of excellence attained in the photography proper. Reference was made to the correspondence with the Birmingham Association in regard to the origin of photographic survey, the meeting cordially supporting the position taken up in the contention by the Hon. Secretary, Mr. C. B. Reader. Mr. J. MacDonald Bell exhibited several novelties, and Mr. J. A. Forrest gave his paper on "The most Effective Means of Protecting the Sensitive Plate during Development."

BRIGHTON PHOT. SOC.:—The ordinary meeting was held on the 10th inst., the President in the chair. Mr. A. H. C. Corder read a paper on "Platinotype," and demonstrated the hot-bath process; he also showed specimens of the improved printing-out paper introduced by Mr. S. B. Harcastle. Mr. E. J. Bedford made a few remarks on the cold-bath process, and handed round several prints produced by that method. Considerable interest was aroused by the simplicity and quickness with which prints are produced. A large number of prints from negatives taken on Whit Monday excursion to Newick were shown. Next excursion to Steyning, on Saturday, June 28th; train leaves Brighton terminus at 2 p.m.

DEWSBURY AM. PHOT. SOC.:—The monthly meeting was held on June 12th, Mr. J. Taylor in the chair. A letter from the Yorkshire Naturalists' Union, asking the co-operation of members in securing objects of geological interest, was read. A goodly number of negatives, prints, and transparencies was handed round to members. There was a large variety of subjects—landscape, seascape, genre, cattle studies, instantaneous, etc. Most of them were of a high-class order. Mr. Mitchell next gave a demonstration of Alpha paper printing. A negative was selected out of those shown. It was then placed into a printing frame, and a piece of Alpha paper behind. It was next exposed to a gas flame, after which it was developed, and toned and fixed in one bath, the resulting picture being all that could be desired. The whole of the operations were conducted in the presence of the members, and elicited their admiration for the ease and simplicity of manipulation in producing prints.

HACKNEY PHOT. SOC.:—On Thursday, 12th inst., Mr. A. R. Dresser gave a paper on "Hand-Cameras," the President in the chair. Mr. Dresser spoke of the qualities of the cameras shown, viz., Kodak, Rouch's, Facile, Ideal, etc. He used one of his own construction, with which any exact exposure could be made up to the one-three-hundredth of a second. For lenses he preferred a quarter-plate Voigtlander wide-angle. He showed enlargements from pictures taken with it, and they could scarcely be told from ordinary contact prints. He advised the use of Eastman's new films. A discussion ensued, in which Messrs. H. Crouch, J. O. Grant, Dean, the Secretary, and President took part. The President referred to lightning marks in the Eastman paper. Mr. Smith (Eastman Company) said that this was a thing of the past, and that the paper was now much improved. Mr. Abraham showed his new improved Ideal camera, fitted with Taylor's lens and new focussing arrangements, also the Victor hand-camera. Mr. Dresser's slides were then put through the lantern, some very rapid work of his being shown, viz., "The Jumping Dog," three boys jumping, all being off the ground, etc.

HOLBORN CAMERA CLUB:—On Friday, 13th inst., Mr. Plumbridge read a paper from Abraham's Annual by A. R. Dresser, Esq., on "Hand-Cameras," which was listened to with attention by about twenty members, who afterwards had an interesting discussion on the subject. On Saturday, 14th, seventeen members went by train to Laindon Hills under the leadership of Mr. Luxton. Some seventy or eighty plates were exposed.

IPSWICH PHOT. SOC.:—The usual monthly excursion took place on Saturday afternoon the 14th inst., when a pair-horse brake took a baker's dozen of the members to Capel St. Mary, stoppages being made on the way at Washbrook and Copdock, to photograph the village streets and churches. At Copdock the "animal" photographer had a happy half-hour among a herd of cows, undeterred by the presence of a Mr. Bull, while the ecclesiastical enthusiast was busy with the church. At Capel St. Mary a universal attack was made on the church, and there seemed to be an unusual number of interior workers, two of the prominent members having recently purchased W. A. doublets,

which they are no doubt anxious to try. At Capel the Rector (Rev. A. C. Johnson) kindly invited the party to the Rectory, where tea was provided by Mrs. Johnson, after which two groups were taken on the lawn by the "military" photographer. Mr. Johnson having obtained leave for the party to visit Little Wenham Hall, a general move was made thereto; but, alas! this most picturesque and interesting corner of Suffolk could hardly be done justice to, for the light was wretched. The old hall, now used as a granary, with its ivy-clad walls, the new hall, the moat, and the funny little old church would furnish half-a-dozen good pictures.

PAISLEY PHOT. SOC.:—On the afternoon of Saturday the 14th inst. the third outdoor excursion of the season took place. About twenty members and friends gathered at Gilmour Street Station, shortly before three o'clock, and proceeded by G. and S. W. Railway to Howwood, having received an invitation from J. W. Shand Harvey, Esq., to visit the beautiful and extensive policies of Castlesemple. On arrival, the party were received by the head keeper, who acted as guide, and pointed out the various places of note, supplying a great deal of local information which made the visit both interesting and instructive. Pictures were had by some of the members, of the mansion house, and of the ruins of the old Chapel, or "College," as it is locally known, where many generations of the lords of the manor lie buried. Within the policies are some fine bits of wooding and plantation—the timber in many places being very luxuriant and picturesque. One of the sylvan giants attracting general attention was a very fine specimen of the cedar of Lebanon. Some charming views of the loch, with the island and wild swans, can be had from the pleasure grounds in front of the house. About six o'clock the company assembled at the mansion, where a number of groups were photographed and refreshments supplied by the host. In the absence of the President, Mr. Morrison in suitable terms acknowledged, on behalf of the Society, the great privilege which had been extended to the members, and the kindness and hospitality they had received at the hands of the laird of Castlesemple. During the afternoon there were exposed six whole, fifty-four half, and fifteen quarter plates.

SHEFFIELD PHOT. SOC.:—The members held their annual excursion on the 11th inst., the venue being Bolton Abbey and Woods. By invitation a goodly number of members of the Rotherham Photographic Society joined the train at Masbro', arriving at Bolton about 11 o'clock, when a general move was made for the Abbey, and on comparing notes it was found that altogether fifteen cameras had been used, and about 145 plates exposed and ten Eastman films.

STOCKPORT PHOT. SOC.:—The first annual meeting was held on the 11th inst., Mr. W. Banks in the chair, when the report showed a membership roll of forty members, with a cash balance in hand and an amount of £8 3s. towards the optical lantern. During the year there have been several demonstrations, by Mr. W. P. Wilkinson (of London), Mr. H. Cooper, Mr. F. Brooke, and other members; lantern exhibitions by Mr. J. Davenport, President of the Manchester Amateur Society, and Mr. H. Cooper. Rambles have been held in the various nooks and corners of Cheshire and Derbyshire, good results being shown at the meetings. The following were elected as officers for the year:—President, Mr. Thomas Kay J.P.; Vice-Presidents, Mr. Thos. Hilderley and Mr. W. Banks; Committee, Messrs. H. Heginbotham, G. Froggat, G. Ball, jun., H. Robinson, J. Pollard, W. Gourley; Hon Treasurer, F. Brooke; Hon Sec., C. Dawson (32, Heaton Lane, Stockport).

WOOLWICH AND DISTRICT PHOT. SOC.:—The monthly (indoor) meeting was held on the 11th inst. Mr. Mittelhausen was voted to the chair. The meeting commenced with an exhibition of negatives and prints taken on the last excursion to Bostal and during the Whitsuntide holidays. Mr. Corder's views of the neighbourhood on 12 by 10 plates, including many interiors, were much admired. The next meeting was arranged for Eltham on June 21st; in the churchyard at 3.30 p.m.

WEST KENT AM. PHOT. SOC.:—A special meeting was held on the 11th inst., the President, Mr. Pringle, in the chair. The President notified award of silver medal for best of twelve lantern slides to Mr. E. J. Crowe; and silver medal for best paper read at Society's meetings was awarded to Mr. J. Reeves. Mr. Adams having resigned his position as Hon. Secretary, Mr. Edward Hawkins was elected to the post. The remainder of the evening was spent in discussing various photographic topics.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3912. Church Interiors.—Will anyone inform me the best plates to use for photographing the interior of a church, the said church being very dark, with a tower up the middle, and the east window (a very large one) is of very thin glass, and consequently, the nave of the church requiring a long exposure, the window is most frightfully over-exposed; in fact, I can get no detail of the chancel in at all. Any information would greatly oblige.—**ST. GILES.**

3913. Photo-Micrography.—I wish to try my hand at photo-micrography, but cannot go to the expense of an objective. Can I use any other magnifying glass in place of this, that would be less expensive, such as a focussing eye-piece? Any information will be gladly received.—**FOGGE.**

3914. Copying Plans.—What is the most inexpensive method of copying a plan of a town, and where would be the best place to have it done?—**BAKER.**

3915. Gloss.—You may obtain a gloss on photographic prints in three ways, viz.: 1. By burnishing; 2. By using encaustic paste; 3. By enamelling with collodion. Encaustic paste, and enamel collodion, are sold in small and large sized bottles, with full directions on the label.—**J. B. PAYNE.**

3916. Toning Bath.—Will someone kindly give me toning bath with instructions for "Aristotype" paper?—**W.**

3917. Germany.—Can Ilford plates be got in Berlin, and at whose shop? Is there any difficulty in getting plates through the Custom Houses at Hamburg and West Hartlepool without having them spoilt? I am going by that route.—**DROFLI.**

3918. Tyrol.—Will anyone kindly give me any hints respecting exposure in the Austrian Alps? I use Marion's R.R. "Soho" lens, and Ilford ordinary plates. Also do plates need backing for snow scenes?—**G. R.**

3919. Surrey.—Can some brother amateur kindly indicate to me any views worth "taking" in S.W. district, within easy distance of Clapham Junction, and also if a permit is necessary for taking views in Hampton Court Park and Gardens; if so, from whom?—**CHAPPELL.**

3920. Lenses.—Could anyone tell me if Taylor's quarter-plate rapid rectilinear lens is as good an all-round lens as I can get for £3? Also, what size lens ought I to have to use with a rising front to cover quarter-plate, when the front is raised, say, 1 inch, as if I use quarter-plate lens, would not the bottom of the plate have no image on it?—**W. BELLWIS.**

3921. Hypo.—Does the addition of ammonia to the hypo bath take away from its fixing power? If not I should like to use it, as I am told it prevents the negative bleaching in the hypo, which in my case, at any rate, it is very liable to do. If some brother amateur could give his experience in the matter, and could tell me how to prevent its bleaching or fading, I should be much obliged?—**W. BELLWIS.**

3922. Norfolk Broads.—I shall be spending a fortnight on the Norfolk Broads this August, and should feel obliged if anyone could give me any hints as to what to take, right time of day, etc.—**B. WORT.**

3923. Rapidity of Eastman Film.—Can anyone inform me what is the rapidity of the new roller celluloid film of the Eastman Company? I use

Wormald's tables, and should be glad to know how to use them with this film.—**B. WORT.**

3924. Touring in Oxfordshire.—As I intend visiting Witney during the summer months, will anyone kindly give information of "choice bits," "places of interest," dark-rooms where plates can be had, and of places where a day's excursion will be required, and best time of day, and if any permit is needed, and from whom?—**G. KILBURN.**

3925. Burnishing.—Having sent some cabinet photographs to be burnished, I was surprised to find the backs of the cards grooved by the roller, and some even had the surface paper peeled off. When I asked the burnisher the cause of it, he told me some starch must have got on the back when mounted. Can any kind reader please tell me the cause?—**STARCE.**

3926. Plate Makers' Developers.—Will anyone explain the reason why the majority of dry-plate makers, in publishing their developer formulae, invariably put the bromide with the ammonia (I refer to the ordinary two-solution developer of pyro bromide and ammonia)? This arrangement of developer seems peculiar, since the ammonia being an accelerator and the bromide a restrainer, it clearly follows that these two chemicals when contained in one solution must act in direct opposition to each other on the plate. Doubtless the small proportion of bromide given to that of the ammonia in this class of developer allows the latter to overcome, as it were, the restraining properties of the bromide, but still the bromide is there to arrest in a measure the action of the ammonia. If bromide is so essential in a developer as a restrainer, why not put it in the pyro solution and keep the ammonia solution free for action, so to speak; this would practically mean keeping both restrainers together. I have frequently been engaged in preparing developers, and in the case of the kind referred to always adopt the latter course of procedure, but, judging from the numerous formulae published in the manner I have mentioned, that there must be some hidden reason, any suggestion as to that reason would oblige.—**M. N. SMITH.**

3927. Photographic Trip to Channel Islands (Sark).—Going early in July from London. Would like to meet with someone desirous of covering same ground—fourteen or twenty-one days.—**C. E. FORBES.** (Address with Editor.)

3928. Dark-Room at Fleetwood.—Can anyone tell me if there is any professional or amateur who allows his dark-room for changing plates at Fleetwood?—**LANCASTRIAN.**

3929. Hawarden Park.—Can anyone tell me if Hawarden Park, Cheshire, is open every day to the general public, and is there any restriction to photograph the castle, and in its grounds?—**GLADSTONIAN.**

QUERIES UNANSWERED.

- Mar. 7th.**—Nos. 3528, 3551, 3554, 3556.
21st.—Nos. 3585, 3587, 3593, 3595, 3596, 3612, 3614.
28th.—Nos. 3634, 3636, 3640, 3643, 3653.
April 4th.—Nos. 3661, 3664, 3674, 3677.
11th.—No. 3694.
18th.—No. 3718.
25th.—Nos. 3727, 3731, 3735, 3736, 3742, 3744, 3747.
May 2nd.—Nos. 3758, 3767.

June 6th.—Nos. 3878, 3883, 3884.
13th.—Nos. 3885, 3886, 3890, 3894, 3895, 3896, 3899, 3901, 3909, 3910, 3911.

ANSWERS.

3703. Hand-Camera.—Your quarter-plate Instatograph could be used as a hand-camera by simply fitting it in a suitable case, and the plates would be worked in the usual double backs, the number of which need be limited only by the space at your disposal, and the weight you cared to carry. The Thornton-Pickard shutter would be as good as any for the work; but I am afraid that your lens is of too long focus to give good results.—**THE SMITH.**

3793. Blue Prints.—Try an increased quantity of the ammonia ferric citrate.—**THE SMITH.**

3805. Whole-Plate Lens.—Yes; with a small stop.—**THE SMITH.**

3814. Stereoscopic Effect.—A letter on page 371 will probably answer this query.—**THE SMITH.**

3823. Eikonogen.—I used eikonogen some time ago, but the results I obtained were in most cases not equal to pyro. The formula I used is published by Marion and Co., and is given in answer to 3859. No doubt the capabilities of the developer will be greatly improved in time.—**SUNLIGHT.**

3842. Toning Baths, Aristotype.—I have obtained good results by both baths; but separate baths are generally recommended. The combined bath keeps very well.—**SUNLIGHT.**

3845. Hand-Camera.—I recommend one of Abraham's cameras—either the Challenge, Ideal, or Victor. I have a Challenge camera, and three of my friends have Ideals, and we are all perfectly satisfied with them. The far distance comes out fairly sharp. Portraits and interiors can, of course, be taken with a fixed-focus lens; but it is hardly the thing for portraiture. When you have practised a good deal I daresay you will be able to turn out negatives which will stand enlarging up to 12 by 10. You ought to have no difficulty in removing Aristo prints from glass if you clean the glass beforehand properly.—**SUNLIGHT.**

3852. Hydroquinone is soluble only to the extent of about 20 grains to the ounce of water at ordinary temperature, so a 10 per cent. solution is not practicable. To use the pot. brom. for over-exposure, make up a 10 per cent. solution, and add from 5 to 30 minims, according to your need; but it is impossible to lay down a rule as to quantity. You may dilute your developer with $\frac{1}{2}$ to $\frac{1}{4}$ of water for slow development.—**THE SMITH.**

3854. Shutter for Hand-Camera.—If "Inquisitive" will write me (care of Editor), I shall be glad to help him.—**THE SMITH.**

3866. Aristotype Paper.—From 8 to 12 grains, according to character of prints and tone required.—**THE SMITH.**

3870. Toning Bath.—

Chloride gold	...	...	...	15 grs.
Template soda	...	...	...	300 "
Distilled water (212 degs. Fahr.)	...	...	...	15 ozs.

Use when cooled. Keeps fairly well.—**SUNLIGHT.**

3872. Shutter.—From $\frac{1}{2}$ to $\frac{1}{4}$, approximately in the small size. Have not used the plates you mention in hand-camera, but can speak highly of Edwards' Isochromatic, Page's 50-times, and Thomas' thickly-coated rapid.—**THE SMITH.**

3887. Rapid Doublet.—I do not possess one of the lenses mentioned, but suppose that the combinations would be symmetrical, in which case the focus of the back lens alone would be about double that of the combination. The stop $f/8$ would then become $f/16$, and exposure would be quadrupled.—**THE SMITH.**

3887. Rapid Doublet.—The use of the back combination alone will, of course, increase the time of exposure, as the focus will be about double that of the lens used as a doublet. Thus, in your case, where you intend to use same stop, etc., and find that one second is the correct exposure for the doublet, four seconds will be required for the single lens.—**J. B. STEPHEN.**

3888. Developing Detective Plates.—It looks very much like the lens being partially covered during exposure. Does the shutter completely uncover the lens during exposure, or is there something amiss inside? Perhaps your plate is not entirely covered during development.—**J. B. STEPHEN.**

3888. Developing Detective Plates.—The fault is not in development, but in focussing. If your lens be slightly nearer the plate than the equivalent focus, all your picture will be indistinct except the immediate foreground, the light from which will fall on a part of the plate furthest from the optical centre of the lens. Try a few plates with a little longer focus, and make sure that the axis of the lens is at right angles to and in centre of the plate.—**THE SMITH.**

3888. Developing Detective Plates.—Quinol spreads very rapidly, and it may be that; or your developer is too strong. You would do better to use the pyro formula of Mr. Lange's, which is:—

Washing soda	...	...	...	2 ozs.
Boiled water	...	...	...	16 "
Brom. ammon.	...	...	...	20 grs.

Take $\frac{1}{2}$ oz. of above, and make up to 2 ozs. with water, and add 3 to 5 grs. of dry pyro.—**ERKO.**

3889. Eikonogen.—Yes; you can use it in one solution. The best form, in fact. Try Warnerke's

Sulphite soda	...	...	40 parts.
Distilled boiling water	...	...	200 "
Eikonogen	...	...	20 "
Caustic potash	...	...	20 "

1 to 3 parts water for use. It goes (solution) dark, but does not detract from its developing powers.—**ERKO.**

3889. Eikonogen.—The following is a thoroughly good formula. It should not be used as a one-solution developer:—

A.	
Eikonogen	200 grs.
Sulphite of soda (recrystallised)	200 "
Dist. water, to make	20 ozs.

B.	
Carbonate of potass. (commercial)	2,400 grs.
Sulphite of soda (recrystallised)	1,000 "
Dist. water, to make	20 ozs.

C.	
Caustic potass	800 grs.
Sulphite of soda (recrystallised)	1,800 "
Dist. water, to make	20 ozs.

Three parts of A to one part of B.

In cases of under-exposure or for instantaneous pictures, use C instead of B. To correct over-exposure add a few drops of 10 per cent. sol. potass bromide. Fixing solution; Hypo. 1 lb., water

quart. Use hot water to mix A solution.—J. B. PAYNE.

3889. **Eikonogen.**—(1) To 4 parts sulphite soda and 1 part eikonogen, which are placed in either an earthenware or enamelled vessel, 10 parts of water are added, and the dissolution brought about by boiling and stirring. The hot solution is then poured into a flask containing 50 parts cold water. (2) 3 parts crystallised carbonate soda are dissolved in 20 parts cold water. Immediately before developing mix 3 parts No. 1 with 1 part No. 2. The one-solution formula works well, but I prefer the two-solution.—SUNLIGHT.

3891. **Bromide Emulsion.**—I generally use boiling water, scraping off old gelatine with a piece of glass, then clean them with whitening, and a final rub with a clean leather. With regard to coating, you must have a levelled surface of some description on which the plate must be put to set. I find a slab of marble excellent for this purpose. Be sure it is quite level, or uneven coating will be the result. I always measure the emulsion, about 1 dr. to the quarter-plate. Melt by placing bottle in water at about 70 or 80 degs. Fahrenheit, and spread emulsion over plate with a glass rod.—J. B. STEPHEN.

3892. Payne's Formula.—

No. 1.			
Hydroquinone	...	...	4 grs.
Meta-bisulphite potash	...	...	4 "
Bromide potash	...	...	1 gr.
Distilled water	...	...	1 oz.

No. 2.			
Potassium hydrate (sticks)	...	...	10 grs.
Distilled water	...	...	1 oz.

Use equal parts of 1 and 2.—J. B. PAYNE.

3892. Payne's Formula of Hydroquinone Developer.—

A.			
Hydroquinone	...	...	40 grs.
Meta-bisulphite of potash	...	...	40 "
Potassium bromide	...	...	10 "
Distilled water	...	...	10 ozs.

B.			
Potassium hydrate	...	...	100 grs.
Distilled water	...	...	10 ozs.

To develop, use equal parts of A and B. By J. B. Payne. See AMATEUR PHOTOGRAPHER, October 19th, 1888, page 248.—J. RAWLINS.

3893. **Adapter.**—A flat brass ring with internal and external threads by means of which a lens may be carried in a flange otherwise too large for it.—THE SMITH.

3897. **Whole-Plate Lens.**—If you do not wish to pay a high price for a lens, buy Taylor, Taylor, and Hobson's rapid view lens, and you will not regret it. The slight distortion given by a good single lens will not be noticeable in one negative out of twenty, unless you go in for architecture to a considerable extent.—THE SMITH.

3897. **Whole-Plate Lens.**—Cannot do better than either Wray or Taylor.—EIKO.

3898. **Eikonogen.**—Does not stain like pyro, and can be used for bromide paper; otherwise has no other advantage.—EIKO.

3898. **Eikonogen.**—See answers to 3823 and 3389. Most of my experiments were made with Ilford ordinary plates.—SUNLIGHT.

3900. **Most Rapid Lens.**—Both are practically the same; f/8 is f/8 equally on any lens.—EIKO.

3900. **Most Rapid Lens.**—Practically they are of equal rapidity, as the difference in the amount of light lost by passing through two combinations in the doublet as against one in the single lens is so small as to be of no real importance.—THE SMITH.

3902. **Stops.**—To find this out, ascertain what is the focal value of your lens, and divide aperture of stops into it, which will give f/3, f/16, or whatever it works out. For (1) third stop, (2 and 3) fourth stop.—EIKO.

3903. **Dark Slides.**—Tylar's slides are dearer, but more reliable than wooden ones.—EIKO.

3904. **Gloss.**—Squeegee wet prints on to an enamelled plate, such as can be got from Abraham's, 81, Aldersgate Street, or Tylar's.—EIKO.

3904. **Gloss.**—If you use albumenised paper a burnisher is the thing.—SUNLIGHT.

3905. **Sky.**—Do you cover up your diaphragm slot and dark slide when exposing? Possibly your slides let in light.—EIKO.

3905. **Sky.**—There is probably some light reflecting surface inside either the camera or dark slide. See that everything, from the lens's hood to the screen behind the plate, is a dead black. I suppose your camera and slides are perfectly light-tight.—THE SMITH.

3906. **Burnham, Somerset.**—Reply is given under "Holiday Resorts" in present number.—T. BAKER.

3907. **Lens, Objective only.**—If a Lancaster lens will answer your purpose, you can obtain either the Merveilleux or Instantograph unmounted. The prices are 3s. and 12s. 6d.—THE SMITH.

3907. **Lens, Objective Only.**—Lancaster supplies unmounted lenses, such as you require, for 3s. The one I got works splendidly in a camera I have made. It requires a fixed stop of about $\frac{1}{8}$ in., and will work at about f/13.—J. B. STEPHEN.

3908. **Eikonogen.**—See answer to 3889.—EIKO.

3908. **Eikonogen.**—See answer to 3889.—SUNLIGHT.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED:AM:PHOT:

R. A. R. BENNETT.—Thanks for your kindness in sending in the letter. We shall not open up the question again. Do you wish the letter returned?

F. W. ROTHWELL.—Thank you for the suggestion, but we could not afford to illustrate "Holiday Resorts," etc.

R. L.—You should have seen that the glass was perfectly clean, and polished the face of it with French chalk, then your print would have stripped off without difficulty.

EDWIN SMITH.—We see no reason why 3874 should not be answered, and have not time to look up the others, although you may be correct in your suggestion.

A. B. SWIFT.—In what competition did you send your prints?

X. Y. Z.—The whole subject will be dealt with early in July.

INDIA RUBBER.—Messrs. Stevens and Haynes, 13, Bell Yard, Temple Bar, E.C., published at 2s. 6d.

R. L.—Annually.

R. P. S.—We should have every confidence in advising you to buy the R.E. No. 1, but are not quite certain whether it is made with Iris diaphragm. Really your concluding paragraph is too flattering.

G. NICHOLSON.—The difficulty, of course, is in getting pure flour paste. We should never recommend the use of it, because of the acid action which sets up.

ROBERT SMITH.—The photographs are really very fair, but we have not sufficient knowledge of the commercial side of the business to fix their "worth per dozen."

E. L. MACCOLSFIELD.—The 7 by 5 size is very useful, and you will do well to have a lens covering a whole plate. If you can afford it, by all means have 1 or 2. 3 is a good lens, and works at f/8, and is suitable for portraits, landscapes, and, in fact, is a first-class all-round lens. 4 and 5 are both good lenses. 6 is the last out of the lot we should select. You will do your work best with an R.R.

SACUL.—Yes; but the figure or figures should compose the picture, and the landscape be subservient to it or them.

M. CARR.—1. We have found plate makers quite willing to sell us a few plate boxes. 2. We cannot give you the name of a paper, but if you search the "Dailies" for the week ended February 15th of this year, you will find what you require.

D. J. LEWIS.—We will try and obtain the information for you, and send on.

PONS ROMANO.—Use the developer recommended by the makers, but increase the restrainer and clear thoroughly. As your object should be to get a hard negative with black and white contrast, we should advise your using hydroquinone.

G. J. MOORE.—We know of no book upon ferro-types, but have no doubt Mr. Fallowfield could give you all the particulars that you need.

J. W. CARPENTER.—We have not worked with the lens, but have heard that it covers well, and gives good definition.

TRAMP.—In answer to No. 1 we can only say that the camera shown to us, and which we noticed, left nothing to be desired in the matter of finish and rigidity. No. 2 you should be able to; both lens and shutter would, if genuine, bear the name of maker. If traders are dishonest enough to insert inferior lenses into known makers' mounts, it is extremely difficult to detect them.

G. H. S. (Burnley).—Your negative is under-exposed, and the print has been toned in a bath weak in gold; the paper has dirty stains, which are not at all to be excused. Increase your exposure according to the time of day, and see that you have a diffused light to work in, and develop slowly.

D. S. WHITELAW.—(1) We should advise A. (2) Quite to be relied upon. (3) C is certainly not equal to D. (4) By all means D, which works at f/8, and will answer your purpose admirably.

M. B.—The camera is considered to be one of the best in the market, and certainly possesses some excellent features. The 10 by 8 lens would, of course, cover sharply when using a larger stop than the 8 by 6, but for all-round work the latter would be the better one of the two for a whole-plate camera.

IRWIN.—B is one that gives general satisfaction. A CONSTANT READER OF THE AMATEUR PHOTOGRAPHER.—(1) A single landscape lens. (2) The equivalent focus of the lens for the purpose men-

tioned should be as long as the extension of the camera will permit. (3) Yes. (4) Narrow angles. The W.A. lens is of short focal length. The distant detail can only be increased in size by increasing the focal length of the lens. Get a long-extending camera and a single view lens.

C. C. VEYERS.—Received too late for this week. BRUCE.—Buy No. 2 or 3. One is as easy as the other.

R. J. B.—The shutter you write about is well made, quick, and under full control.

F. R.—We can confidently recommend A, B, C, and F, preferably A and B.

LUX.—Camera No. 3 or 4. Lens, 2 or 3. Shutter, 1, 3, or 4. At present you will hardly require a burnisher. No. 1 is a good machine.

G. J. JONES.—Clean with oil and the very finest flour of emery. It may be necessary to have the steel burnished, in which case you must send to the maker.

S. J. L.—Damp plates are useless.

J. R. R.—We place them in the following order: 3, 1, 4. No. 2 is not of any use for good work. No. 5 has some good points.

H. H. SUMMER.—We cannot speak positively, but believe the firm have ceased manufacturing.

H. L. HUDSON.—The book in question is not published by our firm.

PIUS.—It is possible to copy daguerreotypes. See Wall's "Dictionary of Photography." The cleaning is a very delicate operation.

E. G. DRAPER.—We do not care to push the matter any further.

MISS ROSE WOOD.—The photographs will be on view at Creed Lane next week.

T. GARDNER.—We insert your letter, and think well of the scheme.

Monthly Competition.

No. 13.

LANDSCAPE OR SEASCAPE.

Title of Picture.	Name of Sender.
Land's End, Cornwall...	P. Heriot.
On the Blyth	S. H. Barton.
Bramcombe Chine	G. W. B. Waters.
Solitude	J. Orton.
Sokla	...
Off Ramsgate Pier	W. Avalon.

Evening on the River Colne, Herts	...	F. de Paula.
The Lower Strid near Bolton Abbey	...	R. T. Houseman.
The Strid	...	J. Atkinson.
Our Favourite Walk	...	E. J. Dawson.
A March Morning	...	George Brown.

Travelling Studentship, 1890.

ENTRIES in the above competition have been received from the following ladies and gentlemen:—

Fred. Mackenzie	...	Glasgow.
J. E. Heath	...	Cardiff.
H. J. Martin	...	Tollington Park, N.
Alfred Stieglitz	...	Vienna.
A. M. Morrison	...	Glasgow.
A. D. Guthrie	...	Leith.
J. F. Kelly	...	Peckham Rye, S.E.
H. S. Smith	...	Bradford.
A. R. Dresser	...	Bexley, Kent.
G. F. Zimmer	...	Anerley, S.E.
A. Machacek	...	Budapest.
Rev. W. Mann	...	Bristol.
J. O. Burry	...	Wrexham.
E. A. White	...	Wolverhampton.
Cyril S. Cobb	...	Hughenden, Surrey.
Rev. James Drew	...	Chipping Sodbury.
W. T. Goodhew	...	Finsbury Park, N.
W. L. Spence	...	Manchester.
Robert Murray	...	Plymouth.
Rev. J. M. Mello	...	Derby.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum being one shilling, upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer."—AMATEUR PHOTOGRAPHER, November 30th, 1888, to December 27th, 1889, including Prize Tour Number (December 14th, 1888, missing), all quite clean; 4s. — Irwin, Photographic Chemist, etc., North Shields.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

The Proprietors of the *AMATEUR PHOTOGRAPHER* offer, Monthly, two prize consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP), for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE WITH FIGURE	July 14.
GENRE OR FIGURE STUDY	Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS ETC.	Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors.

In addition to the Medals being given, the prize photographs may be produced in the *AMATEUR PHOTOGRAPHER*.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Competitive prints are available for exhibition before Photographic Societies after the 1st of each month.

Entry forms on receipt of stamped addressed envelope.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

The following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his *personal experiences*. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

28th OF EACH MONTH.

Subject.

28th June Plates and Films: their Development and After Treatment.

All MSS. to be addressed to the Editor, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

VALUABLE ENGLISH PATENTS FOR SALE.

C. P. STIRN'S PATENTS FOR

1. CONCEALED VEST CAMERA. Pat. No. 9655, July 27, 1886. 16,000 of these Cameras sold in 3 years.
2. PANORAMIC REVOLVING CAMERA. Pat. No. 6673, May 3, 1887, & Pat. No. 6886, April 25, 1889.
3. MAGAZINE TURNOVER CAMERA. Pat. No. 5449, March 30, 1889.

The Concealed Vest Camera has a world-wide reputation; it is the only Camera which can be carried concealed on the person.

The Panoramic Camera lately invented commands already quite a sale in the United States, and will soon be known all over Great Britain and the Continent.

For full particulars, price, and terms, apply to C. P. STIRN, 20, PARK PLACE, NEW YORK, U.S.

SWINDEN & EARP'S PATENT PRIZE MEDAL HAND CAMERA.

THIS CAMERA combines with extreme simplicity more advantages than any other, and is admitted to be the best and most perfect invented. It is constructed to carry TWENTY PLATES, though any less number may be placed in the Camera. The Plates are changed automatically, and instantly. No carriers, metal sheaths, or double backs are used. The Camera is fitted with an excellent R.R. DETECTIVE LENS of 5 1/2 in. equiv. focus working at f/7, and special adaptation of Kershaw Shutter. It is perfectly free from knobs and projections, has rising front to Lens, an ingenious method of focussing, and an indicator for showing the number of Plates remaining unexposed. It is adapted for use on a Stand, and vertical pictures can be taken with it. Outside Measurements ($\frac{1}{4}$ plate), 10 1/2 in. long, 5 1/2 in. wide, 6 1/2 in. deep. Neatly covered in Leather.

PRICE: $\frac{1}{4}$ -plate Size, £7; 5 by 4 Size, £8.

OPINIONS OF THE PRESS.

The British Journal of Photography says:—"It differs in many respects from any others of the same class hitherto introduced."

The Photographic News says:—"The principal object aimed at in the construction has been to combine as many advantages as possible."

The Amateur Photographer says:—"An ingenious, simple, and well thought-out apparatus."

To be obtained of all Dealers, and of the Sole London Agents, PHOTO. ARTISTS' STORES, 43, Charterhouse Sq. Trade, please address the PATENTEEs, 21, Islington, Liverpool.

The Photographic Art Journal says:—"A noticeable feature is the total absence of any external knobs and obtrusive buttons, all the movements being effected in a most inconspicuous manner."

Photography says:—"It strikes us as being very good."

The Camera says:—"This appears to be the most perfect Detective Camera which has yet been produced."

VOL. XI. No. 299.]

FRIDAY, JUNE 27, 1890.

[PRICE TWOPENCE.]

• OUR • VIEWS. •

To hold as 'twere the mirror up to nature."—*Shakespeare.*

WE have much pleasure in announcing that through the courtesy of the Editor of the *Lady's Pictorial* we shall next week reproduce the illustrated notice which he so kindly inserted descriptive of the AMATEUR PHOTOGRAPHER First Ladies' Competition. We shall add some technical description and criticism, and are sure that our readers will be exceedingly pleased with the work done by lady photographers. The photographs are on view at our offices, Creed Lane, from eleven o'clock till four, except on Saturday. They will remain on show all next week.

* * * *

A LETTER has appeared in regard to the formation of a photographic society for Camberwell, and we have received a letter from the Hon. Secretary of the Brixton and Clapham Camera Club pointing out the policy of the Camberwell men joining with Brixton. We entirely endorse this recommendation, provided the place of meeting is within anything like easy reach. It is certainly better that there should be one strong society; we therefore would cordially call the attention of the promoters of the Camberwell Society to Mr. Levett's letter. The Brixton and Clapham Camera Club have already done good work, and we are sure the Camberwell men will have no reason to regret joining forces.

* * * *

WE are unavoidably compelled to hold Mr. Valentine Blanchard's contribution upon the "Stereoscope" this week. We are pleased to note a growing interest in stereoscopic work, and shall again offer prizes for competition in the hope that a large number of workers will enter our competition.

* * * *

NEXT month we shall announce particulars of several competitions, some of a novel form, and others those which have so materially assisted to earn for the AMATEUR PHOTOGRAPHER the high position it occupies.

* * * *

WE had quite hoped to have settled upon the Judges for the "Travelling Studentship Competition," but our at-

tendance at Chester has prevented the work being done. We have also to excuse ourselves from not to-day publishing the awards in the "Monthly Competition" for the same reason.

* * * *

WE publish several letters on the question of "buyer and seller." Our desire is only to secure justice to both sides, and we know that at times the buyer is exceedingly troublesome and petty to the seller. We also know that sometimes, not often, we are happy to think, the buyer "filches" the seller. These are matters which we should be glad to hear more about, and hope manufacturers and dealers will not hesitate to write us.

* * * *

ON Monday evening the fifth annual Photographic Convention of the United Kingdom was opened at Chester by the Mayor. The Convention this year is under the able presidency of Mr. C. H. Bothamley, F.I.C., F.C.S.,. The attendance at the opening Conversazione was very large, and the President's address, which we publish in another column, was listened to with rapt attention. Mr. Bothamley's intimate knowledge of every branch of the science of photography, and his careful watching of the advances being made, his own researches and experiments all focussed together in the address, combined to make it one of the best ever delivered. It is rarely that one finds a man in photographic circles who can speak for nearly an hour without note or reference. Hardly a section of the photographic art was left untouched, and many of those who were present will carry away with them knowledge that may serve them in many ways. Mr. Bothamley's references to colour photography were not very hopeful, and we do not consider that he laid sufficient stress upon the advances that have been made in the application of photographic processes to book illustration. He trotted out the *Daily Graphic* as an example, but we think we are right in saying that but few, if any, of the pictures are direct reproductions from photographs. The photographer may have aided the artist, who, in most cases, plays sad havoc with the truthful photograph. He spoke

at some length upon the assistance photography is to the study of astronomy, and how much has been learnt by the work done by Professors Common, Roberts, and others. As a whole, the address will be read with the greatest interest, written in masterly language by a great worker and thinker, a man of great promise, and one who already ranks amongst the foremost in works of experiment and research.

The social arrangements included a concert and lantern show. Of the former we have nothing to say, and of the latter only that it opened with slides showing the members in attendance at the various meetings of the Convention since its formation, and views of the ordinary type. The hospitality extended by the Mayor was of a liberal kind, and the splendid rooms of the City buildings were "furnished well with guests." Upstairs there was an exhibition of apparatus. We think many amateurs would join the Convention, as members, if they knew the trouble annually taken to arrange a good programme. Certainly the programme of excursions could not be surpassed. Opportunity is afforded to see places which under other circumstances are almost inaccessible. We, therefore, hope that many will see their way to join, and so help the Convention to extend its field of usefulness. During the evenings of the week papers are read and discussed, and much useful knowledge is to be acquired. We hope, therefore, that many of our readers will send in their names and take part in next year's Convention.

* * * *

As promised, we give a very extended list of "Dark-Rooms." Those included in the hotel and Continental list are, of course, available without introduction. We believe that the list as a whole far exceeds in completeness any that has ever been compiled. It is our intention shortly to publish a small hand-book for touring photographers, and the list of Dark-rooms will be included as an appendix.

* * * *

In our advertising columns will be found the preliminary announcement of an Exhibition to be held in Edinburgh in November of this year, under the auspices of the Edinburgh Photographic Society. We shall hope shortly to receive a copy of the prospectus, and shall then have occasion to refer more fully to the prospects of the Exhibition.

* * * *

At a recent meeting of the Liverpool section of the Society of Chemical Industry the following papers were read: "Photo-chemical Investigations, and a new method of determination of the Sensitiveness of Photographic Plates," by Ferd. Hurter, Ph.D., and V. C. Driffield; "A New Actinometer," by Ed. Geo. Ballard, A.R.S.M. These papers are to be found in the Transactions of the Society, and will be of great interest to the student in photography.

* * * *

At the soirée of the Royal Society, Burlington House, Mr. Gambier Bolton, F.Z.S., read a paper on "Animal Photography," and exhibited about fifty slides from his series of animal and bird studies from life before a large and appreciative audience, including many of the leading naturalists of the day. Those who are present at the Conference at Chester this week will have an opportunity of seeing these slides, as we notice that Mr. Gambier Bolton's name is down for a paper on "Animal Photography," illustrated.

THE preliminaries for the Liverpool, 1891, Exhibition are progressing favourably, and already much space has been secured. Our opinion of the prospects of the Exhibition is well known. It is sought to make it of an international character, to which end the prospectuses have been printed in French and German. No effort will, we are sure, be wanting on the part of the executive to make the Exhibition the most successful that has ever been held in this country.

* * * *

In another column we publish an article on "Rambles," and shall be very pleased if it leads to a discussion upon the whole subject of photographic outings.

* * * *

It will be remembered that some time since we suggested the establishment of Dark-rooms in railway carriages in connection with some of the long-journey express trains. We have received the following letter from the Superintendent of the Great Northern Railway:—"I cannot recommend that a dark-room or compartment should be set apart in our carriages for the purpose of developing, etc., photographs. A very serious expense would be incurred, and we should have less accommodation than at present for the conveyance of passengers in our trains."

* * * *

LADIES' PHOTOGRAPHS.

It has most certainly been a pleasure to examine the large series of photographs which resulted from our Competition for Lady Photographers, and it is decidedly a source of satisfaction to have ocular proof of the fact that the army of amateur workers with the camera includes so many ladies in its ranks. An examination of these specimens of ladies' skill discloses certain features, which are somewhat surprising. The first one is that the technique on the whole is equal, if not superior, to the average of that exhibited in the ordinary open competitions, in which, with one or two exceptions, the sterner sex only enter. Assuming, as we are justified in doing, that the whole of the work necessary in the production of these photographs has been performed by the exhibitors themselves, the fact is patent that ladies are now not content to send their plates to be developed by professional photographers, or to resort to the same source for the prints required from their negatives, but are themselves becoming well versed in the various mechanical manipulations necessary for the production of good photographic work. This is most decidedly as it should be. The mere holding a camera or arranging a view on its ground-glass screen, with the subsequent releasing of a shutter or removal of a lens cap, does not warrant anyone of either sex in posing as a photographer, especially in the event of a complete ignorance existing in even the elementary knowledge required for the subsequent treatment of a sensitive plate in order to produce a negative. Nevertheless, human nature is so constituted that there are some men over whose clouded brains the truth of this assertion has never dawned, and whose vanity blinds them to their absurdity. The clever work now being done by ladies will surely have a tendency to clear the air of these lowerers of a beautiful art to the level attained by mechanical toys, and to stop some of the silly babble prevalent in society upon a subject that requires study and intelligence for its correct appreciation.

As was to be expected, a far greater number of the photographs under review are of subjects more or less of a

domestic character, and the percentage of portraits is much higher than it would be among an equal number of male competitors. If anything, the ladies appear to excel in this class of work. Doubtless their models are more patient under their hands, and they have the advantage a knowledge of the various little arrangements of dress or of attitude can confer which is not generally possessed by their husbands and brothers. Also they bring to this work a love which enables them to take a keen pleasure in its various details. It is, in fact, a field for the camera wherein ladies can distance rivals of the opposite sex. Nevertheless this special branch of photography, as it includes indoor portraiture, with its difficulties anent the lighting, is one requiring the exercise of great expertness, if really good work is aimed at, and therefore the ladies who have sent in specimens of their skill in this direction most decidedly deserve praise for its excellence.

Another feature of these picture which attracts attention lies in the method of printing. Very few negatives have been printed on bromide or platinotype paper, but the majority are on albumenised or the silver chloride papers, and the artistic advantage to be derived from matt surfaces does not appear to have yet permeated the ranks of the amateur photographic sisterhood.

In the photographs of landscapes the views have been, generally speaking, well selected, a discrimination being apparent which is certainly in no way below that generally shown by the majority of the competitors in our open competitions. In some of the minor details, however, especially in those connected with what is known as "finish," a large number of the photographs emanating from ladies display a marked inferiority. To mention one particular, very few of the photographs in question have the edges cut correctly, the outlines in some instances being so faulty that they give the perpendicular lines in the pictures a falling appearance; in very many others the edges are ragged, or rather, we should say, jagged, evidently the result of trying to properly trim them with a pair of small scissors. This is such a noticeable defect, and so marked even in work which in other respects exhibits most painstaking care, that we think we can give the ladies no better advice than this: Never touch a photographic print with a pair of scissors; get a sharp knife and a properly squared cutting glass, which can be purchased from any dealer in photographic appliances; then by placing the paper on another sheet of glass and arranging the lines of the picture in correct parallel with the edges of the cutting glass when placed over it, the margins of the print can be trimmed with the knife, using the thick sides of the glass as its guide. Also remember that by neglecting certain small but necessary precautions in the printing, trimming, and mounting, an otherwise first-class photograph may be utterly ruined, and the effects of all previous skilful work destroyed. The finished result in every respect must be as perfect as care can make it, otherwise it is not a photograph to be proud of. Attention to these small but important matters will enhance the marked excellence of the ladies' work, and as we purpose shortly having another competition of a kindred character, we trust our remarks here made may be taken in a kindly and encouraging spirit by our fair readers, to whom at any time we shall be only too glad to render all the assistance in our power.

Letters to the Editor.

LIGHT IN THE DARK-ROOM.

SIR,—In his letter of May 16th, Mr. Davies issues a word of warning to those who fix plates in actinic light, and gives Captain Abney as his authority. He states that in fixing in *non-actinic* light we have the following equation:

and that the hyposulphite of silver and soda thus formed is *soluble*; while that by fixing in *actinic* light we get

and that the double hyposulphite of silver and sodium is *highly insoluble*, and that the same equations apply equally to AgCl, etc.

What the comparative degrees of insolubility may be need not be discussed, but it is alarming to have such statements applied to albumen chloride prints, which are frequently fixed in actinic light.

That Captain Abney has produced such an equation as the last is difficult to believe, but as I have not the "Treatise on Photography" by me I cannot consult it, but quote the following from the "Instruction in Photography" by the same author, seventh edition, page 18:

"In fixing prints, sodium hyposulphite is almost invariably used as the fixing agent, and a strong solution is necessary to secure permanency of the print. . . The reason why a strong solution should be used is that there are two silver hyposulphites which can be formed

and—

If silver iodide or bromide be substituted for the chloride, the same reactions will occur. The first double hyposulphite is *nearly insoluble* in water; the last is *highly soluble*."

No mention is made here of the action of light, but the formation of soluble or insoluble hyposulphite of silver depends entirely on the strength of the fixing solution. Please observe also that Captain Abney's statement in the "Instruction" as to which hyposulphite is soluble is directly the reverse of what Mr. Davies "quotes" from the "Treatise."

What Abney does say respecting fixing in actinic light is as follows: "The fixing should take place in the dark-room, as a rule, though if the plate be alumed it will not suffer; if it has not been alumed, it will veil, and with alkaline developer often shows green fog." ("Instructions," page 161.)

Mr. B. Davidson's letter of the 23rd May, with the list of authorities he gives, ought to convince any one that plates may be fixed in actinic light when well *washed*, without fear of fog, but on June 6th Mr. Davies returns to the subject, apparently only strengthened in his own theory by Mr. Davidson's letter. Let him quote his authority verbatim, and then there may be some chance of light (actinic or otherwise) being thrown on the subject.—Yours, etc.,

WALTER DE H. BIRCH.

June 16th, 1890.

PHOTOGRAPHIC SURVEY OF SHEFFIELD.

SIR,—I notice in your issue of 20th you have reproduced a letter which appeared in the *Sheffield Independent* from Mr. Howarth, with regard to a suggested photographic survey of this district.

In this letter is a statement which reflects upon the members of the Sheffield Camera Club, followed by a resolution which it is alleged by the writer was passed by the Club.

I do not wish, in your columns, to enter into any controversy as to the reasons which caused the Camera Club to postpone the survey, but I am requested by the Council to say that no such resolution was passed, or any resolution which could by any possibility be twisted to convey such a false impression. As you have published this letter, I beg to enclose copy of correspondence which has appeared in the paper.

It is very desirable that a survey should be carried out, and

speedily, and members of the Camera Club are and have always been willing and desirous of furthering such a scheme, and will welcome a scheme which is brought forward and managed on a reasonable and workable plan.

The reasons why this particular scheme was not carried out are not of public interest, and I regret that the question should have been brought before the public in such an objectionable manner.—I am, etc.,

G. E. MALEHAM,
(Hon. Sec., Sheffield Camera Club.)
June 21st, 1890.

NOTE.—We have seen the letters, which are too long for insertion. Mr. Howarth can, of course, state his case if he likes. It seems to us a pity that the survey could not have been proceeded with.—ED: AM: PRIOT.

* * * *

DISCS OF GLASS AS CONDENSERS.

SIR,—The discussion on the above subject has dropped so long now that I daresay I shall be deemed a nuisance for starting it again; however, I hope you will be able to insert this letter. A short time after the instructions of "Stradivari" appeared I set to work on my condensers. I procured the glasses recommended from the stated address, and after completing both lenses left them two months for the cement to harden before experimenting. I have recently returned to the work; but after setting the lenses in wood with the convex surfaces about a quarter of an inch apart, and making a trial, the result was disappointing. I set up a three-wick magic-lantern lamp in front of my condensers, and a portrait combination on the other side and a screen on the wall. I then placed a negative close to my condensers, and looked at the screen, but could see nothing but a bright spot with a sort of halo round it. I adjusted the apparatus in every imaginable way, increasing and diminishing the distance between all the various parts, and shifting perpendicularly and horizontally to make sure of the centre, but to no purpose. I got mostly on the screen a bright ring with a darkish centre; at other times a bright ring with a darkish ring inside that, and a bright centre. At no time was there a vestige of my negative to be seen on the screen. The only time I ever got an even disc showing my negative, was when the lamp was about three feet from the condensers, and the objective about two; then by holding a piece of paper about three inches from the front lens I got an illuminated disc about an inch and a half in diameter with my negative focussed clearly on it. This was the only position in which I got anything approaching a reproduction of my negative.

If some one of your readers who has been successful in this experiment could show me a way out of my difficulties I should be grateful. Perhaps I ought not to omit to mention that in my glycerine there has come a very faint kind of milky substance which appears to have run down from the edges where the glasses are cemented. Has any one else noticed this, and would it affect the proper working of the lenses?—Yours, etc.,

E. M. H.

* * * *

EXHIBITION SWINDLES.

SIR,—At the Hartlepool Photographic Exhibition, held in November last, it was my *misfortune* to be awarded six meda's. I use the word misfortune advisedly, for though a man may write a few score of letters without much falling off in weight, still the constant licking of postage stamps somewhat glues up his best smile.

Now, sir, no dun has ever been more persistent in his applications to a debtor than I have to the Hon. Secretary of the above-mentioned Society with the object of obtaining my gold medal.

My earliest supplications—in tone and volume like unto the wailings of a motherless calf—appeared to touch some remote corner in the heart of the Hon. Secretary, for he would, at that "prehistoric" date, occasionally reply that he really hoped I might get it. My more recent pleadings—"fixed" and "toned" according to state of liver—now and then did the "bad penny" business, and returned, marked "Gone away—no address."

Now, Mr. Editor, please advise me. Am I to keep a pair of private secretaries, or to die with a postage stamp sticking to the roof of my mouth?—I am, sir, yours in doubt,

West Court, Detling, Maidstone.

JOHN E. AUSTIN.

NOTE.—The publication of this letter may have the desired effect, and secure to Mr. Austin his gold medal. For many weeks we were not advised who had been awarded the AMATEUR PHOTOGRAPHER Medals at the Exhibition. The whole business seems to have been very unsatisfactory.—ED: AM: PRIOT.

PACKING DRY PLATES.

SIR,—We shall all agree with most of Dr. J. Lindsay Johnson's letter on this subject. But I feel it a duty to brother amateurs to record my experience with reference to one sentence, viz., "With nothing between the films."

Last summer I exposed some ten dozen plates (8½ by 6½) in Normandy and Brittany. I packed them face to face with nothing between the films, tied them up very tightly in packets of six, wrapped them in the usual way, and wedged them firmly back into their boxes. I even took the precaution to dust the plates after removing them from the slides.

Result: Some of the negatives damaged by scratching, and many others by small holes, varying from the size of a pinhole to that of a hemp-seed. Cause (as it appears to me): The detachment of minute particles from the film, which worked upon the surfaces. I have often felt such particles projecting upon the film, when passing the fingers over it; and I can understand how the jarring of foreign railways and the merciless handling of porters completed the mischief. The plates were of two well-known brands. Others, with absolutely even surface, may be safe under such treatment, but I do not intend to run the risk again. I shall either place a sheet of chemically harmless paper in immediate contact with each film, or adopt the still better plan (though more tedious) of inserting strips of card to keep the faces apart—just as many makers now pack their plates. An amateur friend has suggested the fastening of very small wafers at each corner as an alternative.—I remain, yours, etc.,

WILLIAM MANN, M.A., S.C.L.

Cathedral Precincts, Bristol.

SIR,—As my letter in last week's number of the AMATEUR PHOTOGRAPHER appears to have been somewhat misinterpreted, may I be allowed to say that, so far from wishing to depreciate the Edwards dry plates, I consider them among the finest and most brilliant that money can procure; indeed, I should never think of travelling without some of them, were it not that I have so many plates broken and spoilt through no other cause than his method of packing them, that I have often preferred to put up with an inferior plate to avoid the danger of breakage or the trouble of repacking them all in a safer way.—I remain, yours very truly,

GEO. LINDSAY JOHNSON.

* * * *

ACID FIXING BATH.

SIR,—Mr. Knott, replying to Mr. Fred Davis, in your issue of June 13th, entirely misses the point in question.

It is quite correct that acidity of the hypo bath should be avoided, since strong acids like sulphuric acid, etc. (and also their acid salts, such as alum), decompose the hypo with the ultimate formation of sulphur dioxide, and the precipitation of sulphur.

Sulphurous acid is an exception to the above rule, and may (if perfectly free from sulphuric acid, such as obtains in a solution of bisulphite of soda) be added to the hypo bath without fear of decomposing it, and at the same time it removes pyro stains much more completely than the usual clearing solutions. The only danger from the use of bisulphite of soda in the fixing bath seems to be that the plates are more liable to frill.—Yours, etc.,

C. F. SEYMOUR ROTHWELL.

SIR,—Mr. Fred Knott has apparently mistaken the purport of my letter. If he will kindly re-read it he will notice that I say that the new compound is an "addition to the fixing bath." I will now quote the *English Mechanic*:—"If to a quart of fixing bath (one to four) we add about 2 ozs. of acid sulphite solution, the bath is rendered acid, but no change takes place otherwise. In this bath any negatives can be fixed."

In looking over the "Year Book of Photography for 1884," I came across "a perpetual hypo bath," described by Henry Platt, which consisted in the addition of 30 grs. of citric acid to the hypo. Mr. Platt stated that he had used it for months, and had cleaned "hundreds of plates" without the slightest stain.—I am, yours, etc.,

FRED DAVIS.

June 19th, 1890.

BUYER AND SELLER.

SIR,—Will you kindly allow me (in that impartial spirit which conducts your admirable journal) to offer a few remarks under this head.

As I was the first Englishman to explain to my fellow-countrymen the working of the roll-holder (though not now in the employ of the Eastman Company), I may lay claim to some knowledge of Eastman productions, and I will say that the introduction of the roll-holder with either negative paper, stripping films, or the new transparent films has created a revolution in photography not even second in importance to that of Sayce and Bolton.

With regard to Eastman prices, I should say the public have nothing to do except determining whether they will pay them or not. So long as the Eastman Company hold their patents they have as much right to charge what they please as any English firm, and, knowing as I do the amount of capital that has been sunk, the experiments made, and the time devoted to bringing these goods to perfection, I am surprised they are not higher.

In reply to "F. G. B.," I will tell him who Mr. Walker is. He is the inventor of the roll-holder, and the chief militant spirit in fighting the battle of the films; and the present business of the Eastman Company is a splendid monument to his indefatigable industry, energy, and courage, and it owes its position solely to Mr. Walker.

Surely courtesy does not depreciate argument, and this, I think, is due from one gentleman to another, and especially as the one attacked is one of "our American cousins."

Trusting I have not ventured too much on your valuable space, I am, etc.,

ARTHUR C. BALDWIN.

June 20th, 1890.

SIR,—Kindly permit me to say a few words in support of those of your correspondents who find cause to grumble at the prices etc., asked for photographic apparatus, etc., by makers and dealers. For instance, a half-plate mahogany camera, with rising front, double swing-back, very portable, etc. (*ad lib.*), three dark-slides, an R. R. lens and tripod; the amount of money asked for same is £15 to £18! Who could possibly reconcile this with a conscientious business transaction of value for value? It seems to me to resolve itself into a matter of "fleecing." Similar prices are often paid by inexperienced people, who run away with the idea that if they pay this price the acme of success is safely within their grasp.

How keen the disappointment which overtakes them when they find others, who have only paid perhaps £5 or £6, have, for all practical and useful purposes, a set capable of the highest results, provided the ability, or shall I say genius, is forthcoming on the part of the operator!

Personally I do not altogether blame dealers, but you, Mr. Editor, must come under the lash as well. How often following the review of an article by the Editors of the photographic Press do we find the following or some similar sentence, "Altogether we consider the article very cheap at the price named, etc."

But, sir, I am happy to say that I think you are coming round to a more common-sense view of matters, and if dealers are not very short-sighted they will doubtless soon follow suit; otherwise amateurs may be compelled to take some steps amongst themselves for their mutual protection against being regarded as a set of people who are to be "fleeced."

Professional photographers, I understand, are treated altogether differently to the long-suffering amateurs, being allowed discounts from list varying from 25 to 50 per cent.—I am, yours truly,

THOS. L. BUCK.

SIR,—Now that the meeting kindly permitted by you between myself and Mr. Abrahams, at your office, has taken place, with results which I trust will be satisfactory to both parties, there is no need for me to trouble you with a lengthy reply to Mr. Abraham's letter, which appeared in your last week's issue. Only on two points I should like to say a few words.

Mr. Abraham stated that my camera is not the "Ideal," as advertised; but I cannot agree with him that it is "totally different." On referring to the invoice I find it is described as a "Special Ideal hand-camera."

I should mention that my first order was for an ordinary Ideal; but finding that it was fitted with the Laverne lens I decided

on having another kind adapted to it, having already a camera fitted with the above named. I accordingly consulted Mr. Abraham about it, and he wrote to me as follows, "We should recommend you to have an Ideal fitted with a Tylar's R.R. lens, and made to focus at two different distances; you would then have, in our opinion, the finest camera and lens it is possible for money to buy." Under these circumstances I think I was quite justified in using the word "Ideal" when writing about it.

Secondly, Mr. Abraham complains that I did not write to him if I found anything wrong with the camera, instead of addressing myself to you. In reply to this, I beg to state that the day after I received the camera I tried it, and was so dissatisfied with it that I *did* write to Mr. Abraham, and told him that I should be happy if he would take it off my hands for £2 less than I had paid for it. My offer was not accepted.

Again thanking you for your courtesy, I remain, yours truly,
June 23rd. J. R.

SIR,—As "Victim's" remarks, in a recent letter in the AMATEUR PHOTOGRAPHER, anent the "firm in Leeds," to whom he "sent stamps for new catalogue," which he has not received, evidently refer to myself, I trust you will permit me to explain to this gentleman and many other "victims" why they have not (or rather, *had* not) received a copy of the catalogue. As stated in my advertisement, which appeared in the same issue as "Victim's" letter, the number of copies originally ordered and received from the printer were found to be wholly inadequate to supply every applicant, and a further edition had to be put in hand, and I could not afford the time and cost of writing to considerably over a thousand unsupplied applicants for the list. I may say, however, that a notice stating reason of delay was sent to all who wrote a second time, and I trust all who have written for one have now received their copy.

Apologising for introducing such a personal matter into your columns, but trusting you will favour me with its insertion in order to justify myself in the eyes of your readers, I remain yours faithfully,

C. C. VEVERS.

Leeds, June 16th, 1890.

SIR,—The complaints *re* buyer and seller might doubtless be multiplied *ad infinitum*, but Mr. Young's letter, I think, strikes at the root of the matter. It is questionable, however, whether any remedy would be found in his suggestion. I think a much more powerful organization of the photographic army is needed to meet the circumstances.

Cannot the amateurs—and professionals as well—supply themselves with every requirement? A few thousand £1 shares, on a co-operative basis, would be readily taken up. We should then know who we were dealing with. I am good for fifty to one hundred shares.—Yours, etc.,

A SUBSCRIBER TO THE "AMATEUR PHOTOGRAPHER"
FROM No. 1.

SIR,—I am very glad to see you ready to admit a warning to dealers on the way in which they treat amateurs.

Some time ago I wrote to a well-known firm for a bottle of spotting medium, enclosing considerably more than the value as marked on the bottle and the postage. In spite of my application the change was never in any shape returned to me.

More recently I wrote to a large London house for small quantities of aurine and aurantia. The aurine was not sent, but instead erythrosine, which, owing to its deliquescent nature, arrived in a worthless condition. I wrote to call attention to the mistake, enclosing a portion of the stained letter, and requesting the aurine, but had no reply.

Again, I wrote to another house requesting a small quantity of paper by return of post, stating I urgently needed the paper. I asked also for an enamelling plate and sample of black paper, but these not urgent. The dealer in this case delayed the whole to ask for sixpence more, and even after this was sent there was long delay before I received the ordered articles.

Lastly, I wrote to Messrs. —, asking for some Aristotype paper and some albumenised. A packet of white Aristotype reached me, indeed, merely tied up in a bit of paper; no attempt to protect it by card or by rolling. It was crumpled and unserviceable. As for the albumenised paper, that never

reached me. In reply to my complaint as to the careless manner of sending and omission to register, came some long rignaroles about the custom of the dealer, as if that were relevant, beyond containing confirmation of my blame. The postage expended by him upon his futile correspondence would have amply secured the arrival of the order.

Well, of course, after this experience I shall order what I want of Paris dealers. I do not remember ever to have had their goods go astray or hang fire in the same remarkable way as happens when English dealers are in question. I must, however, say that Messrs. Perken and Rayment seem to show the utmost attention to foreign correspondence, and contrast most favourably with the firms I allude to above.—Yours, etc.,

ELECTRA.

June 18th, 1890.

* * * *

THE KODAK.

SIR,—Unavoidable circumstances have hindered my answering Mr. Walker's letter in your issue of the 30th ult. before, and I am not perfectly convinced that the subject matter of that letter merits a rejoinder. Mr. Walker credits me in the opening lines of his letter with courtesy, but the following lines do not permit my extending the like credit to him, in so far as concerns his use of uncomplimentary epithets, and the wilful wresting of my remarks. I shall not descend to discuss details with Mr. Walker as to the premises on which he bases his estimate of my technical knowledge, merely referring him to my article, where he will find a perfect refutation of his assumption; neither will I follow his plan of evading a difficulty by starting a fancied second one (for the difficulty which he alludes to in the seventh paragraph of his letter is only a seeming one, of which he must have been aware when he penned it, "pairing" being the simple, uncouth, and usual mode of meeting it.)

With regard to Mr. Walker's absurd flourish of trumpets—I challenge to myself to supply 1,000 lens, etc.—I shall not stultify myself by repeating anything I have before said; but at the same time I would point out the politic overweighting of his challenge, in that he requires a considerable amount of extra preliminary work done in order that they (the lenses) shall be in a condition to "fit Kodak tubes."—I am, etc.,

82, St. Thomas' Road, Finsbury Park,

F. T. NORRIS.

June 22nd, 1890.

SIR,—In your issue of May 30th, I endeavoured to test the sincerity of Mr. Norris's statement as to the cost of a No. 1 Kodak lens, by offering to receive from him 1,000 pairs at the price he had stated they could be obtained for. Having received from him no reply, I now increase my offer to *double* the amount, and I will be pleased to receive a thousand pairs of lenses at *sixpence* per pair.

The last effusion of your anonymous correspondent from Trieste reminds me of one of Abraham Lincoln's stories, who at the beginning of the civil war was attacked by every conceivable kind of abuse. He said he felt like the man who was overtaken in the woods by a furious thunderstorm. Both the thunder and lightning were simply frightful. After several ineffectual prayers, he finally prostrated himself upon the ground, and prayed, "O Lord! if it's all the same to you, I'd like a little more light and a little less noise!"—Yours truly,

WILLIAM H. WALKER.

The Eastman Photographic Materials Company, Ltd.,

115, Oxford Street, London, W.,

June 23rd, 1890.

SIR,—I feel very reluctant to trouble you with a letter, but I consider it would be extremely ungrateful to the Eastman Company to let such an attack as made by your correspondent "F. G. B.'s" letter, dated Trieste, 11th June, pass unchallenged.

I have been using a quarter-plate Kodak for some time, and must say the results I obtain, taking objects moving at ordinary speeds (I have not tried the camera so far on very rapid ones), groups, architecture, etc., are so good in every respect, that I really could not desire anything better. The portability of the camera is such that, considering the number of exposures you can carry, makes it, in my opinion, the best in the market in this respect. Further, the mode of focussing is extremely handy and efficient.

That the lens must be good is clearly borne out by the results—surely the best test!

As far as the price is concerned, I do not grudge same, as the Kodak does all it is represented to do.

If "F. G. B." is so clever, why does he not produce a camera at so low a price as he suggests? Taking into consideration the immense amount of thought and labour it must take to invent a new camera, and the risk of novelties superseding it at any moment, I think a firm producing a really good article is entitled to a fair price. Besides, no person is compelled to purchase a camera unless he so desires. I hardly think it fair of amateurs to attack manufacturers in the way I have noticed in some letters on this subject.

I may mention that I have no pecuniary interest in the Eastman Company, or any connection with the photographic trade in general.—I am, etc.,

A. I.

June 20th, 1890.

(Amateur, pure and simple).

* * * *

THE CAMBERWELL SOCIETY.

SIR,—With respect to Mr. G. Pike's letter in your last issue, I venture to suggest that, as we are arranging for a more convenient meeting-room than the one we at present occupy, and which will, if possible, be nearer Brixton station, it would be to our mutual advantage if he would join forces with us. One strong society will accomplish more good work than two smaller ones in districts so close together. Trusting that this proposal will commend itself to Mr. Pike and his fellow-workers, I remain, yours, etc.,

T. W. LEVETT (Hon. Sec.).

Brixton and Clapham Camera Club,

35, Bedford Road, Clapham, S.W., June 23rd, 1890.

* * * *

EIKONOGEN.

SIR,—This is a good and reliable eikonogen developer, which will keep for a long time in two solutions.

No. 1.

Sulphite of soda	6 ozs.
Hot water	60 "
Eikonogen	1 oz.

Shake the bottle well to make the eikonogen dissolve.

No. 2.

Carbonate of potash	4 ozs.
Water	22 "

To develop normally exposed plate: Add to 4 ozs. of No. 1, 1 drachm of No. 2; after the image has begun to appear, add from 1 to 3 ozs. of No. 2 to give density. The negative gets so dense that you have to hold it up to the window of the dark-room lantern to see what is in it; then immerse in hypo bath, after which it will not be too dense. The same is also very good for bromide paper.—Yours,

J. W. P. GIBSON.

Are Photographic Rambles Remunerative?

BY H. MACLEAN, F.G.S.

THE above query refers to half-holiday club excursions.

Doubtless, many will, without hesitation, answer it in the affirmative; but the District Editor for Liverpool, in his report published on May 9th, mentions a discussion which was held, when it was, *inter alia*, stated that "outings are too scratchy and hurried to be of advantage," and "skimming over country is apt to make operators, particularly the young and inexperienced, slovenly, careless, and indifferent."

The above quotations indicate that there exists a respectable minority which does not consider rambles are remunerative; I therefore propose to set forth a few considerations which should make all concerned pause before deprecating such outings.

Allowing (which I am not inclined to) that there is no-

positive gain derived from a half-day excursion, shall there be "no more cakes and ale"?

"Parcentes ego dexteras
Odi . . ."

Why should we be stingy with our plates? Is there not an alluring charm in sometimes indulging in a genial go-as-you-please photographic jaunt? After all, *some* among the most captivating landscapes have occasionally been obtained with very little premeditation or leisure.

Another and more matter-of-fact reason in favour of summer rambles is that they serve to keep members of a society well in touch at a period when the activity of the society in other directions is almost nil. Moreover, members spending an afternoon in each other's company in the woods, by the sea, or "between the acres of the rye," become much better acquainted than they do by attending ordinary evening meetings; and further, many a man who is a comparative nonentity during the winter session blazes out into a star of the first magnitude when met with in the studio of nature. In fine, there can be no doubt that the good-fellowship of a society is vastly augmented by these quasi-photographic picnics.

Again, it hardly needs demonstration that the half-day jaunt is most beneficial training for our weaker-kneed brethren, although no immediate result of their efforts is to be expected; but, as Shelley has it—

"What though no mice are caught by a young kitten,
May it not leap and play as grown cats do?"

There are hundreds of amateurs who for lack of artistic training misprize the grandest of scenes, perhaps for want of shifting their point of view a dozen feet or so. How can their eyes be opened but by a ramble with an old hand? In no other way can an "object lesson" in selecting views be given; and many are the instances which I can recall where such a lesson has worked wonders for one who had previously been "groping in the dark." The same remark applies to such matters as the calculation of exposures, having regard to the monthly and hourly variations in the amount and quality of light, and also to the character of the scene to be taken.

Surely no practised hand would hold aloof from an excursion because, forsooth, he would have to "give all and take nothing"? But if the old bird is mean enough to leave the fledgling to his fate, "let him take heed, lest he fall" himself. For it is not often that a clever man can spend an afternoon with a score or so of workers without picking up some unconsidered trifle of knowledge, which may prove of more value than it at first sight seems.

Before concluding, I would impress upon those who have the organising of club rambles the advisability of always arranging for the party to visit some place which would not be open to individuals, but to which a society can usually obtain the entrée. I refer to parks, gardens, mansions, and various other private and public enclosures, or buildings having interesting features: of such there are many available within a few miles of any district, if secretaries or presidents will only take the trouble to find them out.

Such visits very much enhance the value attached to membership in a society, and, costing nothing, are yet precious in that they help to keep those who would be backsliders from leaving the society. Besides, some local "big-wigs" are not merely pleased to see members at work on their property, but are thereby led to help the society forward in various ways which their influence or idiosyncrasy may suggest.

In visiting any private property, members should always be reminded by the gentleman in charge (and there ought

always to be a leader) that it behoves each individual to behave with due restraint and consideration, and not do anything likely to bring odium upon the society.

While on the subject of excursions, I would urge on secretaries of photographic societies the desirability of combining to press upon railway companies the necessity of their granting a substantial reduction in fares to parties of photographers going on a club excursion. Most of the railways already issue special cheap tickets to *individual* anglers who belong to fishing clubs, and allow a reduction to football teams, etc. Why should they not do as much for members of photographic societies? Here is something useful for the big London Photographic Associations to occupy themselves about; that is if they can condescend to such hum-drum matters.

Science Notes.

Among the papers read at the meeting of the Royal Society on June 12th, were two by Dr. Huggins and Mrs. Huggins on "A New Group of Lines in the Photographic Spectrum of Sirius;" and "Note on the Photographic Spectrum of the Great Nebula in Orion." The marvellously rapid manner in which photography is revolutionising astronomy is, perhaps, the most remarkable feature of the science of the present day.

The Geographical Society has awarded the Murchison Grant for 1890 to the distinguished Italian photographer, Signor V. Sella, "In consideration of his recent journey to the Caucasus, and the advance made in our knowledge of the physical characteristics and the topography of the chain by means of his series of panoramic photographs taken above the snow-level from points to which his camera had to be conveyed by trained Alpine mountaineers, whom he took out with him for the purpose from North Italy."

Two members of the Birmingham Photographic Society (Messrs. E. Howard Jaques and W. Rooke) left for Norway last week. Those who saw the magnificent series of lantern-slides, the result of Mr. Jaques' previous trips to the north, which he lectured on at the Crystal Palace and elsewhere, will wish him equal success during the present season. He is followed this week by the President of the Birmingham Photographic Society, Mr. J. B. Stone, who conveys a party of about fifty friends. Mr. Stone carries one of the new large-size Kodak cameras, with rolls sufficient for 1,000 exposures.

Photography meets us everywhere. At the meeting of the Linnæan Society on June 5th, Mr. H. Little exhibited and made some remarks upon a photograph of a remarkable aroid, *Amorphophallus titanum*, which had flowered for the first time in this country.

The Photographic Society of Geneva is doing good work in endeavouring to ascertain, by means of photographs, whether there is any truth in the idea that people grow to resemble one another, in features, after living long together. So far as the investigations have been continued, it appears that there is a greater likeness, in faces, between husbands and wives who have lived together for twenty years or more than between brothers and sisters. Every one of our readers, of course, keeps a "family album," and enters therein—yearly, or at more frequent intervals—photographs of every member of his or her family. Such photographs should yield valuable evidence on this question.

Brooks's Comet (quite invisible to the naked eye) was photographed at Algiers, on May 22nd, by M. Ch. Trépied. Two hours' exposure was found necessary.

The amount of sunshine registered at Greenwich Observatory during 1889 was 1,156 hours; and as the sun was above the horizon for 4,454 hours, we see that the weather of last year was one-quarter sunshine and three-quarters cloudy. So far, 1890 has done considerably better. Let us hope that the improvement will be maintained.

Before the Royal Society of Edinburgh, on March 17th, Professor Smith described how he had applied photography to the study of the surface tension of liquids. Ripples are set up on the surface of the liquid by touching it with a vibrating tuning-fork, and the surface is then photographed along with a suitable scale. The lengths of the ripples can then be obtained by microscopic measurements of the negative. The results obtained for

mercury were very concordant, and agreed with the mean value obtained by Quincke.

Those famous astronomers, the brothers Paul and Prosper Henry, state that photographic halos arising from reflection of light at the back of the plate can be obviated by covering the back of the negative with a film of collodion containing in solution a small quantity of chrysoidine. This varnish has an index of refraction which differs but slightly from that of glass. They find that the halos from the most brilliant stars are suppressed completely by it. The varnish dries rapidly and is perfectly transparent.

A most remarkable camera had been prepared by the American scientists to photograph the total eclipse of the sun last December. A concave silver-on-glass mirror, 20 inches in diameter and of 75 foot focus, was placed so as to throw an image of the solar corona into a huge camera-box set upon a cliff, which lay fortunately just beneath the sun at the time of totality. Here a 10 inch image of the sun, beautifully defined, came to focus, and plates measuring 24 by 20 inches and of the highest sensitiveness, were prepared for exposure. But, alas for the 75 foot camera! the sun, as we know, was obscured entirely by clouds during the few precious minutes of the eclipse.

F. G. S.

Photographic Convention of the United Kingdom.

PRESIDENTIAL ADDRESS BY C. H. BOTHAMLEY, F.I.C., F.C.S.

At our meeting last year we were celebrating the jubilee of the photographic negative, and my predecessor in this chair very fitly devoted the greater part of his address to a summary of the history of photography during the past fifty years. Although, as you will remember, that address had a somniferous effect on the delegate from the Leather Bellows Club, the rest of us listened with much interest to the admirable account of the rise and development of photography which was laid before us. The events of a year usually require much briefer treatment than the events of half a century, and a review of the progress of the past twelve months is unfortunately made easier by the fact that little, if anything, of first-rate importance has been done. No discoveries or inventions of far-reaching influence have startled the photographic world.

Much interest has been excited by the announcement that an Austrian, Herr Veresch, had made a decided step towards the solution of the problem of producing photographs in natural colours. It is understood that the method is based on Carey Lea's researches on the photo-compounds of silver, and that it differs from earlier methods in that the sensitive material is used in the form of an emulsion. How far the results are in advance of those obtained by previous experimenters is a point on which there are differences of opinion. It seems practically certain that, at any rate, some improvement has been made in the permanence of the images, and we shall look forward with much interest to the results of further experiments by the same worker.

This problem of photographing objects in their natural colours is of very great interest. It seems to be the one thing on which the non-photographic public has set its heart; nor are photographers lacking in enthusiasm. How far these desires are likely to be realised we cannot tell. More or less imperfect photographs in colours have often been obtained, but they are not capable of multiplication in the way in which we make hundreds of prints from one and the same negative. Whether we shall ever obtain a chromatic negative process is at present merely a matter of conjecture; we can only say that the direction in which the solution of the problem is to be looked for is not yet apparent.

In dealing with another difficulty—the proper monochromatic rendering of coloured objects—we have made much greater progress. No marked advance, however, has been made since last year, and the general adoption of orthochromatic methods is impeded by the facts that their successful employment, especially for outdoor work, necessitates certain modifications in well-established methods of working; that the preparation of the plates involves some manipulative skill and acquaintance with the selective sensitisers to be used; that it is not at all improbable that a sensitiser with a similar name, but of greatly inferior power, will be used unless great care is taken in purchasing the

materials; that the commercial products upon which many have to depend do not at present represent the maximum possibilities of the methods. Nor is this true only of this country. Examination of many reproductions of pictures shows that some Continental workers have not obtained complete mastery over the capabilities of the processes, even for the particular class of work in which their advantages were most quickly recognised. The whole question of colour, physical and physiological, scientific and artistic, is very complex and difficult. Accurate knowledge and conceptions are comparatively recent acquisitions, and it is therefore not surprising that in the practical treatment of its various problems progress is somewhat slow.

Development and developers have, as usual, attracted much attention. Eikonogen has gradually obtained a firm hold as a useful addition to our developing reagents, its special value lying in the fact that it enables us to obtain well-graded negatives where other developers would be very liable to give excessively strong contrasts. It follows that in dealing with very short exposures eikonogen is of the greatest service. In portraiture also it gives very fine results.

Catechol or pyrocatechin has not been fully investigated, partly on account of its high price. Quite recently, however, Dr. W. H. Perkin, jun., has described a ready method of preparing it from guaiacol, an allied substance much lower in price. In this connexion it is interesting to note that Colonel Waterhouse has recently shown that guaiacol itself is a developer, though it does not possess any exceptional powers.

One very important fact in connection with the principles of development has been established by Mr. Lyonel Clark in the course of his elaborate experiments on different developers, and has been confirmed by later experiments of my own made for quite another purpose. It is that the maximum sensitiveness that a plate will show, in other words, the maximum detail obtainable for a given exposure, is the same for all developers and for all variations in the composition of one and the same developer. Different developers differ, however, very considerably in the time required to make the maximum detail visible, and it follows, of course, that the gradations of the resulting negatives are very different. That, in a word, is the nature of the difference between developers—a difference in gradation and not in the maximum detail obtainable, provided that the action of the developer is continued for a sufficient length of time. Recent papers contributed to the Photographic Society by Abney, and to the Society of Chemical Industry by Hurter and Driffield, are worthy of careful study in connection with the question of development.

Photo-mechanical printing processes have made no remarkable new departure, but their applications continue to increase. Cheap illustrated papers, and a great increase in the number of the illustrations in magazines of all kinds, constitute unmistakable evidence of the usefulness of these processes. Without photo-mechanical printing a paper like the *Daily Graphic* would be impracticable.

Chromo-typogravure, which produces the fine results seen in the *Figaro Illustré*, and chromo-collotype, which as yet is not often seen in this country, produce results in many respects superior to those of ordinary chromo-lithography. They are at present our furthest advance in the photographic production of coloured pictures. Colour printing with typogravure, I may perhaps remind you, will reproduce water-colour drawings with a fidelity so great that it may deceive even the artist of the original drawing.

The applications of photography to scientific purposes become every day more numerous and varied, and I do not hesitate to say that it is in this direction that photography has won, and probably will win, its greatest triumphs. Here it is, without a rival or competitor, and does services which nothing else is capable of doing. As a method of fine art it occupies, and probably will always occupy, a subordinate position.

In no branch of science have the photographic results been of greater importance than in astronomy. Mr. Ainslie Common, encouraged by his great successes with his big three-foot reflector, has constructed and set up in his observatory at Ealing a magnificent five-foot reflector, in almost every respect the most powerful and most perfect telescope that has ever been made. It was designed and erected especially for photographic work, and its performances will be watched with great interest. You will, I am sure, share my pleasure in knowing that Mr. Common has very kindly promised to give us, at our meeting next year, an

account of the later developments and results of astronomical photography. Mr. Isaac Roberts, with a much smaller reflector (twenty inches), at his private observatory at Maghull, near Liverpool, has produced some of the most remarkable photographs that have yet been done. Some of these I am fortunate enough to be able to show you, and I would especially call your attention to the wonderful photograph of the great nebula in the constellation Andromeda, which shows that in this nebula we have a new Saturn in the actual process of formation. The condensed central mass, and the system of long oval rings surrounding it, can be very clearly seen. Of the important bearing of this result on the nebular hypothesis, I cannot here speak. It must be a source of great satisfaction to all photographers to know that Mr. Roberts's splendid work, like that of Mr. Common before him, has this month been awarded the blue ribbon of science—the Fellowship of the Royal Society.

A very remarkable recent result is Professor Pickering's discovery that a certain star is really a double star with its components too close together to be resolved by telescopes. The discovery was the result of observations on the variation in the definition of photographs of the spectrum of the star.

Mr. Andrew Pringle will tell us that photography has its triumphs in dealing with the minute as well as with the immense, and some of those triumphs he will bring before us during this meeting.

Amongst other things, photography has been largely and systematically applied to the study of lightning, and by Lieut. R. Abercromby to the study of clouds and meteorology; by Lord Rayleigh to the study of the effects of electrification on jets of liquid; and by Mr. C. V. Boys to the investigation of falling drops of water. Mr. Friese Greene will describe to us a new form of magazine camera which he has invented, and which is especially suitable for investigations of the kind to which I have just referred. An account of Mr. Muybridge's work we heard from his own lips last year, and this year Mr. Gambier Bolton is to tell us of the results which he has obtained in applying photography to the study of animals from a different point of view. There is, in fact, no branch of natural science in which photography is not rapidly becoming indispensable.

If the application of photography to science have been numerous and successful, the same cannot be said of the applications of science to photography. Most of the problems awaiting solution at our last meeting still remain unsolved. The careful experiments of Mr. Chapman Jones have given us accurate knowledge of some aspects of mercurial intensification, but of the real nature of the latent photographic image, of the change which silver compounds undergo when exposed to light, and of many other reactions which underlie some of our most important processes, we are still almost entirely ignorant. The reasons are not very far to seek. The investigators in these subjects throughout the whole world at the present time may almost be counted on the fingers. I say *investigators* designedly; of experimenters of a certain kind we have enough and to spare, but of competent investigators there are very few indeed. The fundamental problems to which I have referred are very complex and difficult, and their investigation requires a knowledge of chemistry and physics much greater than is usually possessed by photographers, and, on the other hand, a better practical acquaintance with photography than competent chemists and physicists usually have. Further, they involve many micro-chemical and electro-chemical changes with which we are at present imperfectly acquainted. In the less difficult questions of *technique* and processes, the relative merits of different modes of treatment and the like, we might have expected to find more satisfactory progress; but here also we have made no great advances. From time to time, it is true, papers appear in the journals recording so-called experimental investigations of the action of various developers, relative sensitiveness of different plates, and similar matters. In not a few instances they leave us just where we were. So far as the advancement of photography is concerned they represent merely so much wasted time and wasted material—wasted because for want of attention to some indispensable conditions, neglect to eliminate important sources of error, want of distinction between several possible causes and the like, no definite conclusions can be drawn from the evidence offered. The enthusiasm of the experimenters is undoubted, and if a thirst for notoriety is not always invisible, we may take it that a desire to advance photography is their chief incentive. Why, then, do their efforts so often lead to nothing? Chiefly from a want of training in the

art of experiment; from want of acquaintance with the scientific method. A really good experimenter is a rarity; an accurate observer must be both born and made, and is a still less common species. With very rare exceptions, indeed, the scientific method, which includes not only the arts of experiment and observation, but also the power of properly co-ordinating the facts, and of making accurate deductions from them, is only to be acquired by careful and long training. Such training, it is a mere truism to say, very few photographers have had, but to it we must undoubtedly look for our future progress.

I do not, of course, mean that good work cannot be done in photography unless a man has a profound acquaintance with chemistry and physics. I see before me a sufficient number of living examples to at once disprove any such assertion; the scientific method lies not in the matter but in the manner. It would be out of place here to attempt any definitions or illustrations of what the scientific method really is. We might define it negatively as that which is usually absent in photographic experiments, but that would not take us much further. One of the most important characteristics of the scientific method is great reserve and caution in making deductions; one of the chief characteristics of not a few so-called photographic experimenters is a fatal facility for making hasty and incorrect deductions from imperfect data. No stronger proof can be found of the fact that photography is comparatively in its infancy, that its fundamental principles are not generally understood, than the rubbish which is sometimes brought before photographic societies in the form of papers—papers which even now and again escape the waste-paper baskets of the photographic journals. This latter catastrophe, of course, only happens when the editor is away on a holiday. Similar productions are characteristic of all crafts or arts which are still carried on largely by rule-of-thumb; they would not be tolerated in societies of a truly scientific character, or in an art which was really carried out on scientific principles.

Photography has an artistic as well as a scientific and technical side, and if I have not unnaturally dealt with the scientific questions first, I do not forget that the majority of photographers regard the artistic aspects as the more important. In the artistic development we may, I venture to think, congratulate ourselves upon steady and well-founded progress. Argument as to whether photography is or is not a method of fine art is no longer necessary. Its place has been taken by discussions, often of an animated kind, between the different schools of photographic artists—naturalists, naturalists, realists, and the like. Very few who are competent to deal with the matter now refuse to admit that in the hands of a man of artistic temperament and training, photography may be a method of pictorial fine art just as much as mezzotint or sepia. We shall all admit that the possession of a camera and lens will not make a man an artist; neither will the possession of a palette and a box of paints. It is also true that a very large majority of the photographs which we see are far from having any claim to be regarded as works of art, but is that not also true of the bulk of the paintings which are produced? Fine art, I take it, lies not in the method, but in the use of it; in all cases it is the man, not his medium of expression, that determines the result.

In 1873 Mr. P. G. Hamerton, the well-known art critic and editor of the *Portfolio*, very clearly and tersely summed up the case against the claims of photography to rank as a method of fine art. "(1) It is false in local colour, putting all the lights and darks of natural colouring out of tune. (2) It is false in light, not being able to make those subdivisions in the scale which are necessary to attain relative truth. (3) It is false in perspective, and consequently in proportions and forms. (4) Its literalness and incapacity for selection and emphasis are antagonistic to the artistic spirit."

Most of this was true enough seventeen years ago, but we have advanced a little in our knowledge of science and art since then. Falsity in local colour has almost disappeared before the development of orthochromatic methods, the principle of which was discovered in the very year in which Mr. Hamerton wrote. Falsity of light arises mainly from the use of plates of unsuitable quality, and from imperfect knowledge of exposure and development on the part of the operator. Falsity in perspective and the proportion of forms is entirely a question of the proper or improper use of lenses, and need not exist at all. Literalness and incapacity for selection and emphasis are defects in the photographer more than in photography. How far we have advanced in this direction I will bring to witness, if not Mr. Hamerton himself, at any

rate Mr. Hamerton's paper. In the January number of this year, speaking of the photographs which illustrate Miss Agnes Giberne's book, "The Ocean of Air," the *Portfolio* says, "But what it concerns us to observe is that though they are merely literal transcripts from nature, and no other artistic faculty than that of selection has been exercised in their production, this faculty alone has sufficed in several instances to produce genuine works of art. If an artist were to take, for instance, the 'Trees in a Mist,' photographed by Mr. Sutcliffe, of Whitby, it is not too much to say that he would find it difficult to improve the composition or to alter a single line for the better."

In their assault on the fortress of art, photographers have already carried the barbarian, and many may be found in the outer ward. A few have even forced their way into the inner court, but the keep remains in the hands of the painters and sculptors, and in their hands, I doubt not, it always will remain. Every method of fine art has its limitations, and in the case of photography these limitations are in many respects more severe than in any other method. I for one accept Mr. Ruskin's *dictum*, that every true work of art shows distinctly the method by which it has been produced, and that its character and possibilities are largely determined by the method. I have little sympathy with those whose chief anxiety seems to be to make their photographs look like something else. I believe that if photography is to maintain the position already won, and is to make further advances as a method of fine art, we must not only be fully acquainted with and make the most of its capabilities, but we must also quite clearly recognise its limitations. We must be content to admit that there are certain classes of subjects which come rightly within the scope of the painter, but are unfit for treatment by photography. In our appreciation of a picture we cannot forget the method by which it has been produced; and when, for example, you see a photograph professedly of an incident which took place before photography was invented, the unreality and want of truth is too prominent. You are unable to rid your mind of the idea that, after all, it is only a literal representation of a group of models. When, too, we see photographs which profess to represent those human emotions which we commonly hold sacred from intrusion, a sense of unfitness more than counterbalances any pleasure arising out of mere technical artistic skill. All this has been pointed out before, more appropriately, and with much greater force, by the *doyen* of photographic artists, Mr. H. P. Robinson. Lately in America they have very largely developed the practice of photographic competitions, prizes being given for the best set of photographs illustrating some poem or part of a poem, or story; and to some extent the practice has unfortunately, like the potato beetle, spread to this country. If the subjects are properly chosen, with due regard to time and place, such competitions may not do any harm, though it is contrary to experience to expect that any real fine art will be developed in such a manner; but when the outcome is photographs of such scenes as a girl in agony by the deathbed of her father, done, of course, with the help of models—to take only one example out of those which you may see in the American magazines—it is an outrage upon one's sense of the artistic fitness of things.

Even where groups of figure studies of the class to which I am referring are successful, the result is often due to the models quite as much as to the photographer. He has to be content with the best he can make of them; he cannot with his camera alter lines and expressions as a painter can with his brush. In the hands of a few masters pictures of this kind are undoubtedly often successful, but in the greater number of instances they are not at all pleasing to any one but the photographer and the models, and sometimes not even to the models. I hold that in the interests of photography as a method of fine art it is to be regretted that photographers do not chiefly confine themselves to the classes and subjects that photography can deal with excellently, instead of striving after effects and results which, from the essential limitations of the method, are a severe strain on its capabilities. What class of subjects, you may ask, do I regard as proper to photography from the artistic point of view? I would reply, portraiture pure and simple, with studies of figures in costume and groups, if you like, provided that they are put forward as such; landscape and seascape, in which figures are either subordinate or absent altogether. At the risk of making invidious distinctions, I would cite Wellington's "Eventide," Mayland's "There is sorrow on the sea," Gale's "Sleepy Hollow," many of the studies of Sutcliffe, and many of the landscapes of Green, as examples of the class of work which seem to me to

show photography at its best. Some one may raise the old objection that in dealing with pure landscape and seascape you have not sufficient human interest; you can only represent the literal beauty of your subject, and have no opportunity for the idealisation which some hold, though others do not, to be essential to all fine art. I decline to accept the dogma, but even if it were true I would reply in the words of Fra Filippo Lippi:—

"If you get simple beauty, and nought else,
You get about the best thing God invents;
That's somewhat; and you'll find the soul you have missed
Within yourself when you return him thanks."

What can be done to promote the advance of photography, scientific and artistic? The development of a desire for better training, and the provision of means to satisfy the desire. Here, as in many educational matters, we are behind our Continental competitors. Germany has long had an efficient school at Berlin, under Professor H. W. Vogel, and there is a well-known school of a more technical character at Schloss Gronenbach, under the direction of Herr W. Cronenberg. Zurich has a new photographic laboratory full to overflowing. Austria has its new and splendid Photographic Institute, with abundant accommodation, and a large staff of teachers under the direction of Professor Eder, and they attract students not only from all parts of the Continent, but also from England and America. Here in this country we have the schools at the Polytechnic and the Birkbeck Institute, and in various science and University Colleges up and down the country, instruction is given in the principles and practice of photography, but all of them together are scarcely equal to the Institute at Vienna, and they confine their attention almost exclusively to teaching, doing but little in the way of research. In America they are not even so well off as we are. So far as I can learn, there is only one school of any importance, that at Chataqua.

It has been proposed to found a Photographic Institute in this country, and we shall all be agreed that, founded on a right basis and conducted on right lines, it might be of incalculable benefit to photography. Founded on a right basis and conducted on right lines—that is the essence of the whole matter, so far as possible success is concerned. An Institute of Photography, I take it, should teach and examine and conduct original research. It might possibly also act as a court of arbitration in disputes involving technical matters, but the advancement of photography in all its branches and aspects, by teaching and research, should be its chief business. It should be thoroughly, though not ambitiously, equipped; it must be free from connection with commercial interests of any kind; above all, it must be free from the immaturity which so often clings round present-day amateurism.

Whether, when all these conditions were fulfilled, it would attract a satisfactory number of students is a matter of conjecture. We English are slow to avail ourselves of our advantages in matters educational, even where the knowledge to be acquired has a direct monetary value. The experience of existing schools is not altogether encouraging, but the prestige which would attach from the beginning to a properly equipped institution especially devoted to photography would probably do much. The standard of every-day requirements in photography is gradually being raised and there is little doubt that better instruction will be necessary to produce and maintain the higher degree of skill demanded. One thing is certain, that when the establishment of such an institution comes within the sphere of practical politics, the members of the Photographic Convention will not be backward in their support of it.

After all, the real progress of photography depends no more on institutes than the progress of civilisation and human knowledge depends on Acts of Parliament. Am I not right in holding that the spirit which should animate every follower of the photographic art is the spirit which inspired the poet when he wrote—

"In after days, when grasses high
O'er-top the stone where I shall lie,
Though ill or well the world adjust
My slender claim to honoured dust,
I shall not question or reply.

"I shall not see the morning sky;
I shall not hear the night wind sigh;
I shall be mute, as all men must,
In after days!

"But yet, now living, fain were I
That some one then should testify,
Saying—'He held his pen in trust
To Art, not serving shame or lust,
Will none?—Then let my memory die
In after days!"

Register of Dark-Rooms, 1890.

WE beg herewith to present to our readers a revised list of "Dark-Rooms." To our own Register we have added a list of Provincial Hotels where dark-rooms may be obtained, and also a list of towns on the Continent, with addresses, and where either dark-rooms or photographic materials may be obtained. In adding these additional lists we beg to acknowledge our indebtedness to the Britannia Works Company. We have also to mention that the list of Hotels is compiled to a great extent from that excellent publication, the "C. T. C. Handbook."

"Amateur Photographer" List of Dark-Rooms.

We class them in four divisions, *i.e.*, *a* amateur, *d* dealer or professional, *h* hotel, and *s* photographic society.

In our letter of introduction full particulars are given as to owner, address, charges (if any); plates, chemicals, etc., kept by dealers; terms for temporary membership of societies; hotels; distance from station, etc., etc.

Every application for letter of introduction must be accompanied by SIX PENNY STAMPS. The owner of "Dark-Room" will be advised by same post as the applicant. The envelopes should bear the endorsement DARK-ROOMS.

List of Hotels in the United Kingdom placing a Dark-Room at the disposal of guests.

- Amphill, Beds.—White Hart
Ashbourn, Derby—Green Man
Ashby-de-la-Zouch—Queen's Head
Alford, Lincs.—White Horse
Abergavenny—Swan
Ambleside, Westmoreland—Water Head
Aberavon—Walnut Street
Alloa, N.B.—Crown
Annan, N.B.—Queensberry Arms
Aberdour, N.B.—Greig's
Anstruther, N.B.—Commercial
Alyth, N.B.—Airlie Arms
- Burnham, East, Bucks.—Crown
Brixham, Devon—Bolton
Burnham-on-Sea, Essex—White Hart
Berkeley Road, Glo'ster—Prince of Wales
Bromyard, Hereford—Falcon
Bishop Stortford—George
Brading, Isle of White—Red Lion
Bury—White Horse
Berwick—Red Lion
Bridgnorth, Salop—Crown and Swan
Burton, Staff.—Queen's
Beccles, Staff.—King's Head
Ballycastle, Antrim—Antrim Arms
Brighouse and Rastrick, Yorks.—Royal
Bethesda, Carnarvon—Douglas Arms
Bettws-y-Coed, Carnarvon—Glan Aber
Blaenau Festiniog—Maensferran
Banff, N.B.—Fife Arms
Burntisland, N.B.—Forth
Bothwell, N.B.—Clyde
Baltinglass, co. Wicklow—Commercial
- Chesham, Bucks.—Crown
Cheadle, Cheshire—George and Dragon
Carlisle—Grand Central and Viaduct
Chapel-en-le-Frith, Derby—King's Arms
Chudleigh, Devon—Clifford Arms
Canterbury—Falstaff
Chatham—Mitre and Clarence
Colsterworth, Lincs.—White Swan
Cheddar, Som.—Cliff
Cannock, Staff.—Crown
Coventry—Queen's
Corrig-y-Druiddion, Denbigh—White Lion
Cardiff—Angel
Corwen—Owen Glandwr
Cullen, N.B.—Seafeld Arms
Cupar, N.B.—Tontine
Castle Douglas, N.B.—Douglas Arms
Charleville, co. Cork—Imperial
Clanalsilty, co. Cork—Donovan's
Cappoquin, co. Waterford—Moore's
- Dovedale (Thorpe), Derby—Peveril
Devonport—Royal
Danbury, Essex—Griffin
Dursley, Glo'ster—Old Bell
Deal, Kent—Black Horse
- Droitwich, Wores.—Royal Brine Baths
Dudley, Wores.—Dudley Arms
Dolgelly—Angel
Dunbar, N.B.—St. George
Dunfermline, N.B.—St. Margaret's
Donne, N.B.—Woodside, and Donne
- Eton, Bucks.—Crown and Cushion
Ely, Cambs.—Bell
Epping, Essex—Cock
Eccleshall, Staff.—King's Arms
Egham—Victoria and Catherine Wheel
Easingwold, Yorks.—George
Elgin, N.B.—City
Ennis, co. Clare—Queen's
East Grinstead—Railway
- Fenny Stratford, Bucks.—Swan
Feckenham, Worcester.—Rose and Crown
Forres, N.B.—Royal Station
Falkland—Commercial
- Grays, Essex—King's Arms
Gosport—Railway
Glastonbury, Somerset—Crown
Guildford—Greyhound
Goole, Yorks.—Sydney
Guisborough, Yorks.—Bucks
Garelockhead, N.B.—Garelockhead
Garlieston, N.B.—Queen's Arms
Greystones, co. Wicklow—Railway
- Hungerford, Berks.—Three Swans
Hooton, Cheshire—Hooton
Hyde, Cheshire—Norfolk Arms
Helston, Cornwall—Star
Harrow—Railway
Hawes, Yorks.—White Hart
Howden, Yorks.—Bowman's
Holmfirth, Yorks.—Victoria
- Irthlingborough, Northants.—Bull
Inch, Aberdeen—Station
Innerleithen—Traquair
Invergordon, N.B.—Commercial
- Keswick, Cumb.—Keswick
Kington Hereford—Burton
Kettering, Northants.—George
Keynsham, Somerset—Lamb and Lark
Kingston-on-Thames—Sun, and Norbiton
Kenilworth—King's Arms
Kinghorn, N.B.—Kinghorn
Kirriemuir, N.B.—Crown
Kirkcaldy, N.B.—George
Kirkcudbright, N.B.—Commercial
Kingussie, N.B.—Pullar's
Kilkenny—Victoria
- Leighton Buzzard, Beds.—Union
Luton, Beds.—Red Lion
Lymm, Cheshire—Fleece
Lydford, Devon—Manor
Long Newton, Durham—London-derry Arms
Leominster—Royal Oak
Leigh, Lancs.—Lilford
Levensholme, Lancs.—Midway
Leake, Lincs.—White Hart
Longport, Somerset.—Langport Arms
- L Leatherhead, Surrey—Royal Oak
Llandilo, Carmarthen—Cawdor Arms
Llanelli, Carmarthen—Thomas Arms
Llanberis, Carnarvon—Dolbarn
Llangollen—Royal
Llanfair, Montgom.—Boat
Llanfyllin, Montgom.—Wynn-stay Arms
Llangurig, Montgom.—Black Lion
Llanidloes, Montgom.—Trewythen Arms
Leven, N.B.—Caledonian
Lanark, N.B.—Clydesdale
Loch Katrine, N.B.—Stronach-lacher
Limerick—George
Marlow, Bucks—Greyhound
Macclesfield—Queen's
Maryport, Cumb.—Golden Lion
Millom, Cumb.—West County
Matlock Bath, Derby—New Bath
Maldon, Essex—King's Head
Marshfield, Glo'ster.—Catherine Wheel
Maidstone—Bell
Middleton, Lanc.—Assheton Arms
Market Harboro'—Peacock
Melton Mowbray—George
Melksham, Wilts.—King's Arms
Mostyn, Flint.—Mostyn Arms
Mallwyd, Montgom.—Peniarth Arms
Montgomery—Dragon
Milford Haven—Lord Nelson
Mitchelestown, Cork—Fitzgerald
Nailsworth, Gloucester—George
Newent, Gloucester—George
Northampton—George
Newport, Salop—Barley Mow
Narberth, Pembroke—De Rutzen Arms
Nairn, N.B.—Marine
Newton Stewart—Galloway
Oundle, Northants.—Talbot
Padstow, Cornwall—Commercial
Plymouth—Farley's
Purfleet, Essex—Royal
Pontypool, Mon.—Crown
Peterhead—Laing's
Peebles, N.B.—Tontine
Romsey, Hants—White Horse
Redbourne, Herts.—Bull
Ramsey, Isle of Man—Mitre
Rochester, Kent—Bull
Raglan, Mon.—Beaufort Arms
- Rotherham—Crown
Roslin, N.B.—Original Roslin
Sandy, Beds.—Greyhound
Silsoe, Beds.—George
Sale, Cheshire—Wardens
Stockport, Cheshire—Garden's
South Molton, Devon—George
Sandwich, Kent—Bell
Spalding—White Hart
Spilsby, Lincs.—Queen's Head, and White Hart
Stafford—Swan
Sutton, Surrey—Cock and Angel
Studley, Warwick—Duke of Marlborough
Shap, Westmoreland—Greyhound
Sedburgh, Westmoreland—White Hart
Stourport, Worcester—Swan
Sherburn, Scarboro'—Pigeon Pie
Swansea—Royal
Stow, N.B.—Railway
St. Andrew's, N.B.—Royal
Stromness—Mason's Arms
Stranraer, N.B.—George
Tarporely, Cheshire—Swan
Torrington, Devon.—Globe
Towcester—Pomfret Arms
Thames Ditton, Surrey—Orleans Arms
Tarbert, Loch Fyne, N.B.—Maclean's
Usk, Mon.—Three Salmons
Upper Arley, Staff.—Valentia Arms
Wolsingham, Berks—Rose, and Bush
Whaley Bridge, Cheshire—Railway

Warminster, Wilts.—Bath Arms
Welton, Hull—Green Dragon
Withernsea, Yorks.—Queen's
Wrexham—Wynnstay Arms, and Regent Street
Welshpool—Royal Oak

List of Dark-Rooms, etc., on the Continent.

PLATES and photographic material may be obtained at the following towns on the Continent:—

Austria.

- Vienna (T. W. Melhuish, I. Schenken Strasse, 10)
Vienna (Oskar Cramer, The Graben)
- Prague (Adolf Fische, Ferdinand Strasse, 23)

Egypt.

- Alexandria Cairo

France.

- Nice (M. Ferrari, photographer)
San Raphael (M. Ferrari, photographer)
Cannes (Buisson, 12, Boulevard de la Croisette)
- Lausanne (Lausanne Amateur Photographic Society)
Paris (Maison Molteni, Rue Chateau d'Eau, 44)
Mentone (M. An. Fosse, Rue Partoneux)

Germany.

Berlin (R. Talbot, Kaiser Willhelm Strasse, 46)	Dresden (Ernest Kersler, Briest Strasse, 3)
Dresden (C. F. Bernhardt, Palais Gutenberg)	Hanover (S. Federlein, Loui- senstrasse, 2)
	*Mainz

Greece.

Athens (Arthur Hill, Lloyd's Agent)

Holland and Belgium.

Amsterdam	Montague aux Herbes
Antwerp (L. Van Neck, Rue Klapdorp, 10)	Potagères
Blankenburgh	Dinant
Brussels (L. Van Neck, Rue	La Hague
	Liège
	Ostend

Italy.

San Remo (J. Scotto, Rue Victor Emmanuel, 16)	Corso
Genoa (F. Passadoro, Via Ponte Reale, 242)	Gratz
Rome (J. Juliana, Via Babuino, 147)	Padua
Bologna	Peruggia
	Ravenna
	Spezzia
	Venice

Malta.Norway and Sweden.*

Bergen (J. Peter, Torvet, 16)	Stavanger
Christiana (H. Abel, Carl Johans Gade, 45)	Stockholm
	Trondhjem

Portugal.

Lisbon (J. J. Ribeiro, Rue Aurea, 222)

Russia.

Astracan	St. Petersburg (T. Jochim and Co., Petite Morskaia, 4)
Charkoff	Samara
Kieff	Saratoff
Moscow	Varsovie
Poltava	

Spain.

Barcelona (F. Arenas, Plaza Regomi, 5)	*Cadiz
---	--------

Switzerland.

Geneva (E. Baud, Rue Ver- daine, 11)	Montreux (Mons. E. Frau- sioli)
Geneva (Philippe J. Cour de Rive, 11)	Zurich (R. Ganz)

The following hotels also place dark-rooms at the disposal of guests:—

Hotel Bains et Grande des Salines, Bex	M. E. Michel, Vevey, cant. de Vaud
Hotel Beau-Rivage, directr. M. J. Maurer, Interlaken, cant. de Berne	Grand Hotel du Lac, directr. J. Tappert, Vevey, cant. de Vaud
Hotel d'Angleterre, directr. M. C. Demmer, Davos-Platz, cant. des Grisons	Hotel Pension du Panorama, directr. M. N. Blotnitzki, Vevey, cant. de Vaud
Grand Hotel des Bains, directr. M. C. Hiele, Bex, cant. de Vaud	Hotel du Grand Muveran, directr. M. A. Petter Genil- lard, Villars s/Ollon, cant. de Vaud

Grand Hotel de Vevey, directr.	

Turkey.

Smyrna

Holiday Resorts and Photographic Haunts.

A FORTNIGHT IN SWITZERLAND.

By F. W. ROTHWELL.

LEAVING Victoria, we soon reached Newhaven, where we took boat for Dieppe, and then train to Rouen. We stayed at the latter place Sunday and part of Monday; obtaining views of the Cathedral, where the first Duke of Normandy, Richard Cœur de Lion, and his brother, along with several other historical persons, are buried. The original spire was struck by lightning early in the present century, and was replaced by the present one in 1823. We then visited the Place de la Pucelle, where Joan of Arc was burned, and the Palais de Justice, where she was condemned. The Church of St. Ouen and Place de la République next claimed attention, and afterwards the river. We left Rouen, and arrived the same evening at Paris, where about ten days were spent in visiting the Exhibition and the usual places of interest.

Taking the sleeping-car attached to the seven o'clock train, Gare de Lyon, we got to Geneva the next morning.

Geneva is divided into two divisions, almost north and south, by the swift waters of the Rhone, which here rushes from the lake.

The river is spanned by several bridges, the chief being the Pont du Mont Blanc. From the Quai du Mont Blanc, superb views of the Alps with Mont Blanc and the near mountains are seen. A few plates were exposed upon the lake, the boats, and steamers. Afterwards the National Monument and the Duke of Brunswick's monument were photographed.

Taking the boat next morning, we went to Lausanne, and then on to Berne. This place affords numerous subjects for the camera, and from the Munster Platz, a fine terrace overshadowed by trees, and at an elevation of 110 feet above the River Aar, which almost encircles the town, grand views of the Oberland Alps are obtained. The snow-capped heights of the Wetterhorn, Schreckhorn, Jungfrau, and numerous other mountains appear in majestic range bounding the south-eastern landscape, and which at sun-set, in fine weather, are enshrouded with thin clouds, flushing into roseate, and gradually changing into purple hue as the light fades in the evening sky. Leaving there, we visited the Munster, in front of which is a fine equestrian statue of Rudolph von Erlach. Driving to the other end of the town, we saw the Bear Garden, where several bears are kept at the public expense, and then over the bridge. Near this place a good view of the city was obtained.

Traversing the Kramgrasse, we came at length to the Clock, which has several mechanical movements. In Berne there are some curious fountains, one near the Clock-tower in the Kornhaus Platz being noteworthy. It is named "The Fountain of the Ogre," and bears the figure of an ogre devouring a small boy, whilst other children are thrust in his girdle and pockets. After dinner we had a walk through the streets. The houses are principally built on arcades, similar to the rows of Chester, whilst underneath there is a promenade for the foot passengers.

On the day following, Saturday, we left Berne by train to Thun, near to the lake of that name, and on the journey we saw a portion of the army reviewing.

At the east end of the lake, the cliff of the Beatenberg, and the cavern of St. Beatus (the first Christian preacher of the district) are seen, along with glimpses of the Jungfrau and other mountains.

Taking the Bodeli Railway, in ten minutes we arrive at Interlaken. Interlaken is a considerable summer resort, as it forms the centre for various Oberland excursions. Ascent of the Kleine Rugen (2,420 feet), Schynige Platte (6,790 feet), and several other journeys are made from here.

The Jungfrau is seen in all its majesty from the Hohewigg, a fine promenade shaded by splendid walnut trees. There is English Church service at the Convent Church. The hotels are numerous; indeed, as we stood in the station, I counted twenty-three "busses" waiting to take passengers to their respective hotels.

Leaving Interlaken, another ten minutes' run brings us to the lake of Brienza, and as we sail down the lake, we "shot" at the lower fall of the Giessbach. The snowy summit of the distant Susten is seen in the south-east, and the Thierberge to the right.

FALLOWFIELD'S CENTRAL PHOTOGRAPHIC STORES, CHARING CROSS.—We are asked to notify that these "Stores" will be opened on July 1st. Mr. Fallowfield is so well known in business, having been established for thirty-four years at Lower Marsh, Lambeth, that it goes without saying that at these "Stores" everything that is requisite for the work of photography will be found.

* Towns marked thus come under the AMATEUR PHOTOGRAPHER Register, as the gentlemen residing there are amateurs, to whom an introduction is necessary.

Taking train from Brienz, we go to Meringen, where the engine is changed, the scenery during this short journey not being anything particular, as the valley is as level as the floor of any room, though bounded on each side by the mountains, and traversed by the river Aare, which carries along with it the waters of the glaciers and of the smaller streams from the hills.

From Meringen, we ascend by means of the cog-wheel railway, similar to that of the Righi, to Brunig, the summit of the Brunig Pass, 3,295 feet high. The traveller as he sits in the carriage little thinks of the work employed in constructing the railway, of the difficulties encountered, and the danger. He should have been here whilst this portion of the line was being made, and have seen how, when a charge of dynamite was exploded, the fragments of rock were hurled upwards to an enormous height, and then whizzing down through the fir trees, buried themselves deep in the earth. As we rise, we catch a glimpse of the village of Brunigen, lying below us in the valley. The rocky mountain has been carved by the dynamite into all kinds of fantastical shapes, now presenting isolated crags towering high above us, now projecting rocks hanging over us like half-demolished arches. Then there is the view of the numerous gorges and snow-capped heights.

At Brunig station there is a good restaurant, and as we had about forty-five minutes to wait for the train coming up the other side of the pass (there being only one line), we spent the time in exposing one or two plates. Leaving here, the line descends rather sharply for a time down the other side of the pass to Lungern, at a gradient of 1 in 10.

Afterwards we pass the Lake of Sarnen, and hurry on to Kerns, and then to Alpnachstad, where a portion of the travellers take boat to Lucerne. We, however, stay in the train, and after running alongside the lake for a time, the line takes a sudden turn, under the Lopperberg, and then along the shore again to Horw, where we cut across country to Lucerne.

A good view of this town was obtained from the station, Mount Pilatus in the rear; whilst across the lake the Rigi looked quite majestic in the gathering gloom, with its top covered with dark clouds, which were creeping down its sides; and opposite was the town with its four bridges spanning the dark waters of the Reuss. The Kappelbrücke, the oldest of the bridges, is garnished with seventy-seven curious triangular paintings, of the ecclesiastical and secular history of the Swiss Confederation. It dates from the 14th century.

The Mühlenbrücke, the second covered bridge, is more than 300 years old, and is ornamented with thirty-four quaint pictures of the "Dance of Death," referred to in Longfellow's "Golden Legend"—

"All that go to and fro must look upon it,
Mindful of what they shall be."

The Lion Monument, to commemorate the heroism of the Swiss Guards in 1872 in defending the Tuileries, was photographed the next day. The Righi, Mount Pilatus, and several views of the town were taken also.

Tuesday we sailed down to Flueln, at the other end of the lake. This trip is called by Mark Twain, I believe, "The perfection of pleasuring."

As the steamer enters the Lake of Uri, the mountains rise to enormous heights on both sides, and in the distance a glacier can be seen. The plateau of Rutli, 650 feet above the lake, is the scene of the memorable gathering of the Swiss, who swore to maintain their independence against the Austrians in 1307, whilst a little further on is Tell's Chapel and Tell's Platte, which is the traditional point where Tell escaped from Gessler. All three places are now, I believe, public property.

The Meytensstein on the west, 80 feet high and rising perpendicularly out of the water, bears Schiller's name upon its face.

We obtained shots of Vitznau, where the Rigi Railway commences, Weggis, Brunnen, and views of the gorgeous mountain scenery of the lake. This day was about the most enjoyable one we spent, as the scenery was magnificent.

We left the steamer at Flueln, and came home by rail round by the Righi and Lake of Zug.

Zurich was next visited, and some good pictures were obtained of the streets and lake.

From Zurich we went to Basel, seeing the Munster, Rathaus (Town Hall), Museum, and the Monument of St. Jacob, in remembrance of the Swiss who fell resisting the French in the 15th century. On the pedestal of the monument are four sculptured warriors "faithful to death;" while the armour-clad

figure of Helvetia stands above, extending the memorial wreath.

We left Basel for home at 9 o'clock in the evening, and when we got to Delle were all turned out to have our baggage examined, at midnight exactly. It was a dreary job this, half asleep, and then out you get into the cold, and then you stand like a lot of sheep in a long room, while they look whether you have any "tabac, sègars," etc. Go in at one door and out at the other end of the room. Just time for a cup of coffee, and off you are until 9 o'clock in the morning, when you have eighteen minutes at Amiens for breakfast, a cup of coffee, and a roll of bread, for which they charge you a franc (10d.).

We arrived at Calais at noon, and by 5 or 6 o'clock were safe in London (Charing Cross).

As to the customs and our plates, we had no trouble, as, thanks to a label sent me by the Editors of this paper, they experienced no curiosity whatever as to the contents of the "black bag."

Indeed, it was never opened until we arrived at Delle. At Dover they were very anxious to look at everything in our handbags. My plates were changed at most places by means of a small travelling lamp, with some red material and a night-light. I lowered the blinds, and once or twice got under the bed, and at Berne I got into a large cupboard there was in my room.

At Rouen and Lucerne I changed them at a photograph shop, where they charged me fifty centimes (5d.). I did not develop any whilst away, as I did not care to carry the utensils with me.

Iford plates can be obtained in Zurich, whilst several English makes are sold at Nadar's, Rue des Capucines, Paris.

I got some French ones at the latter place cut to English size, for which I paid 4 f. 50 c. (about 3s. 7d.) My camera was a half-plate one, with three double-backs, and Laverne's lens. Altogether we had a splendid holiday.

We had only about three days of rain during the two weeks we were away. One at Paris, one at Lucerne, and the other at Zurich, where it rained almost incessantly the whole afternoon, and which time we spent in the billiard and reading rooms of the hotel.

For a few pence you can get a lad to carry your bag, whilst you take it easy and look for the views, and the porter comes in handy to infuse a little life into some of the pictures. I know mine did. Driving is not so dear as it is in England, which is a fortunate circumstance, as there are several nice places on the outskirts of most of the towns, and you can be driven to the principal sights by merely giving a few directions to the driver.

If you don't understand the language, you can call the porter of the hotel—who, at the first-class hotels, generally speaks English—and he will give the necessary instructions.

In conclusion, I don't know where you can find a prettier place than Switzerland for a few weeks, as there are innumerable subjects for the camera. Have a good shutter with you and plenty of plates or films; the latter preferable; and also have some loose coppers for "pourboires" or "tips," if you don't wish to lose the natives' esteem, and I can say that the more you give them the greater you are, and a liberal "tip" will make them believe you "an English milord" or some other important personage.

* * * * *

THE CITY OF YORK.

By O. E. RUCK.

WITH the exception of such well-known and tried places as our university towns and the quaint and ancient Chester, few places offer such a rich field for the study of photography applied to old buildings, churches, and gateways as does this glorious old city. Not only does this city itself teem with antiquities of all ages from the time of the Roman occupation in A.D. 79 onwards, but within easy travelling distance by railway or cycle the numerous old priories, abbeys, castles, and crosses offer an almost unlimited scope for the camera. Accommodation and good wholesome fare are easily and cheaply procurable at all times in the city, railway excursions take the visitor rapidly at easy rates to places of interest in the neighbourhood during the summer and autumn months, whilst the number of rainy days compared with less favoured localities are few and far between. Without dwelling too long on the opportunities offered by the minster for interior studies, general views from all sides of the city, with the cathedral standing out in bold relief, may be taken, generally with old walls, picturesque houses, the river Ouse and its barges, or some ancient landmark as a foreground. Glimpses of the minster, viewed from some of the antiquated streets, such as Old

Stonegate, Petergate, Swinegate, make characteristic pictures. The walls and bars form special features of the city, and all offer great inducements for the photographer. Chief amongst these are Micklegate Bar, erected about 1300, consisting of a square tower built over a circular arch with embattled turrets at the angles, surmounted by stone figures; the arms of England and France, quartered, and containing those of the City of York, are sculptured upon shields against the front, with inscriptions. Equally interesting for photographic purposes are Bootham Bar, Monk Bar, Walmgate Bar with barbican, Fishergate with its postern. Amongst the churches which, although not of great size, are nearly all possessed of architectural peculiarities, the following present subjects which the photographer with an architectural bent will find acceptable:—St. Michael-le-Belfry, finished about 1536, with a bell-cot on the west gable, and buttresses pierced by gurgoyles. St. Margaret's, Walmgate, with its rich Norman porch and doorway, a grand subject; round the arch of the doorway are the twelve signs of the zodiac, and between the signs are small groups of figures in panels representing some characteristic emblem for each month. St. Lawrence has a similar enriched Norman doorway. All Saints, North Street, St. Martin's, Coney Street, St. Mary, Bishophill, the younger, with Saxon work in the tower; St. Martin's, Micklegate, with Roman work in the West Wall, are all interesting for the photographer. Amongst the ruins of old abbeys, foremost amongst the many subjects is that of St. Mary's, in the City of York; whilst Byland, Rievaulx, Jervaulx, Whitby, Fountains are within easy reach. The Priors of Guisborough, Rosedale, Malton, Kirkham, Bridlington, Kirkstall, Monk Bretton, Bolton, and Mount Grace are some of the monastic remains well worth studying. The remains of St. Leonard's Hospital, York, and St. Anthony's Hall, York, are objects to be recorded by the camera. Clifford's Tower, York, built by the Conqueror 1068, as a keep or citadel for the fortress, situated on a mound elevated above the river, makes a good picture taken from the city walls, across the Ouse, with old walls, river, and boats for foreground and middle distance. The same may be said of the Archbishop's Palace at Bishophthorpe, a semi-pastoral picture. The numerous ruins of castles, isolated old street dwellings, sculptures of coats of arms, and various relics of a bygone age would, if enumerated, take up so much space that it is deemed sufficient matter for study has already been given to show what facilities exist in York for any amount of good work with the camera.

Societies' Meetings.

NOTE.—In this column the Editor can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editor will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BIRMINGHAM PHOT. SOC.:—The first half-day excursion of the season to Coventry was not patronised by members on Saturday last as was expected. One of the objects of society excursions is for members to help one another in the field—especially beginners—and surprise was expressed that so few new members took part in what turned out to be a very enjoyable afternoon. The next excursion is fixed for July 12th to Stratford-on-Avon and the Shakespearean villages, and will be for a whole day, with Mr. W. J. Harrison, F.G.S., as leader.

BRIXTON AND CLAPHAM CAMERA CLUB.—On Saturday, the 14th inst., a party proceeded by train to Leatherhead in search of the picturesque. Although the weather was not very promising, the outing proved a most enjoyable one. Some choice subjects were discovered, and it is intended to pay another visit of investigation, as the neighbourhood appears to afford many opportunities to the "shadow-catcher."

CAMBRIDGE CAMERA CLUB.—A monthly meeting was held at the club-rooms, Jesus Lane, Mr. Dennis Greenwood in the chair. Some platinotypes were shown by Mr. C. Smerdon Roe, which were very much admired. The exhibits of Messrs. Hayles, Potts, Sanderson, and others came in for a like share of praise. Several discussions took place. An outing was made by several members on Thursday in last week to Granchester. The village was reached

by boat. Many pretty spots on the banks and in the village were taken.

CROYDON CAMERA CLUB.—On Saturday, 21st inst., the President conducted a party of members to "The Grange," Wallington, which was kindly placed at the disposal of the society by the owner, Mr. A. H. Smee. Altogether a most interesting afternoon was spent, the only regret being that time did not permit of more careful inspection of the many floral and natural beauties with which the gardens are so richly endowed.

FAVERSHAM INST. PHOT. SOC.:—The second meeting was held at the Institute, on June 17th; Mr. W. C. Stunt, Vice-President, in the chair. It was decided that the society's next out-door excursion should take place on Thursday, 26th inst., to Lees Court (if permission be obtained). The offer of the AMATEUR PHOTOGRAPHER Bronze Medal for the best work done on the excursion was accepted with thanks. A vote of thanks was also passed for the loan of some of their Competition Prints, which were much appreciated. It was decided that the next meeting (July 15th) should be devoted to a show of apparatus in the possession of the members, and a discussion thereon. The Chairman then called upon Dr. Evers to give his paper and demonstration on development, which were well received and followed by a short discussion.

HOLBORN CAMERA CLUB.—On Friday, June 20th, Mr. Luxton gave a lecture on "Lighting the Subject in Portraiture," and passed round examples showing the difference which could be made in the appearance of a face by suitable lighting. On the 23rd seven members went by train to St. Albans, and then walked to London-Colney, where several exceedingly pretty bits were found; after dinner going on by trap to Radlett and Brickett Wood. Forty-two plates were exposed, and a most enjoyable time spent.

LEWISHAM HIGH ROAD CAMERA CLUB.—A meeting was held, June 20th, at the Lecture Hall, Lewisham High Road; Mr. M. Stodart in the chair. Mr. R. W. James exhibited an enlargement on Ilford bromide paper of Westerham church porch. The original was taken on a Thomas' cyclists' plate, with Swift's quarter-plate lens, by Mr. Stodart and enlarged by Mr. James. Both the print on Aristotype paper from the quarter-plate negative to the enlargement showed high-class workmanship, and a vote of thanks was given to Mr. James for the trouble he had taken. Messrs. Stodart and Eastwood exhibited the results of their experiments with regard to fixing in actinic light, the result being that it was proved beyond doubt that fixing by gaslight or daylight would not possibly injure negatives. The plates shown had for the most part undergone very severe tests, being exposed about one and a half hours to sunlight before fixing, and it is doubtful whether the plates would have shown even the slight amount of veiling had they undergone a more complete amount of washing before exposure to sunlight. The question box produced seven queries, which were answered and discussed. The next meeting is to take place July 4th, when Mr. M. Stodart will give a practical demonstration of the development of negatives.

LIVERPOOL AM. PHOT. ASSOC.:—The sixth ordinary meeting of the twenty-seventh session was held at the Association's Club-rooms, 3, Lord Street, on Thursday evening, the 19th June. Mr. Paul Lange presided, and there was a numerous attendance of members. The President reported on the excursion to Rossett and Gresford on Saturday, the 7th inst., when about thirty members and six ladies were present, and 200 pictures were secured. He mentioned that the next excursion would take place on Saturday, the 19th July (whole day), to Bolton Abbey, with Mr. C. W. Reader as leader. A very fine mounted print was presented to the society by Mr. Friese Greene, of London, per Mr. J. Norman Thomas, of the Convention members' group of 1889, taken on 24 by 20 glass plate slightly cut down. The late Mr. J. W. Robinson, jun., a young member of the society who died last month, had bequeathed his camera and outfit to the Association, for use of any of the members of the society. Mr. Beaton (J. J. Atkinson's) then exhibited Fallowfield's Facile camera. The evening concluded with a demonstration and detailed explanation of the new Kodak camera No. 4, 5 by 4, of the Eastman Company. Mr. H. M. Smith was the demonstrator, and, on the motion of Col. Ellison, a hearty vote of thanks was accorded him.

NORTH LONDON PHOT. SOC.:—The ordinary meeting was held on the 17th inst., Mr. Dando in the chair. This was a technical

evening, and the last meeting of the Society in Myddelton Hall. Various appliances having been shown, an interesting discussion took place upon development. The next meeting of the Society will be upon the evening of July 3rd, in the Wellington Hall, behind the Myddelton Hall, when there will be a discussion upon "Lenses and their Uses." The Secretary will open the discussion with a paper on "Photographic Optics."

SHEFFIELD AND DISTRICT OPTICAL LANTERN SOC.—The usual monthly meeting of the above Society was held in the St. Paul's School-room, on Wednesday the 18th inst., Mr. H. Staniforth presiding, the subject of the evening being "Enlargements by the aid of the Lantern." Mr. F. Mottershaw read a carefully prepared paper, which was practically illustrated by experiments on Ilford bromide paper, with one of Lancaster's enlarging lanterns, and was listened to with great interest by a large number of members. Negatives produced at the last excursion were handed round. Arrangements were then made for an excursion to Roche Abbey on July 3rd. The proceedings closed with a hearty vote of thanks to Mr. Mottershaw for his kindly efforts.

TOYNBEE CAMERA CLUB.—The ordinary meeting was held on

June 17th. Enlargements from members' own negatives were exhibited. On June 21st there was an outing to Coulsdon, Chaldon, and Merstham in conjunction with the East London Antiquarian Society. Although the weather was dull, a number of views were obtained of Chaldon and Merstham churches and the surrounding scenery.

WOOLWICH AND DISTRICT PHOT. SOC.—On Saturday the 21st the members held their monthly outdoor meeting at Eltham. By 4 o'clock twelve cameras were at the rendezvous, and a start was then made for King John's Palace. There Mr. Calder took a 12 by 10 of the meeting, with the ruins for a background—having sent on his large camera beforehand for the purpose. Several negatives of the ruins were taken, and the members dispersed in threes and fours to the various spots of interest in the neighbourhood. A visit was paid to Colonel North's famous duck-pond, and snap shots were taken of the pretty white ducks and swans which abound there. The rain coming on smartly, there was a hurried retreat beaten back to Woolwich, but notwithstanding a most enjoyable afternoon had been spent. The next indoor meeting will be held in the Freemasons' Hall on Wednesday, July 9th, at 8 p.m.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

QUERIES.

3930. **Hydroquinone.**—I have lately been using Thomas' formula, but cannot obtain density. Formula states, use equal parts of each. I find this too strong, so dilute with half of water. My negatives are thin, and I have to trust to intensification. What quantities should I use for under or over exposed plates? I use Ilford plates. Any hints will oblige.—**M. GINTY.**

3931. **Books on Photography.**—I want to study the art of photography, and should be glad of the advice of those who know which is the best book on the subject. It must not be too technical, but sufficient to give a clear idea to a beginner why such and such results are produced by such and such causes, etc. Also I should like to know of a simple hand-book on retouching?—**EUREKA.**

3932. **Vignetting.**—Would some one kindly tell me how the shaded part just round the head in vignette portraits is done? I have made a photograph of a head, but the background, an ugly wall, looks very bad. If I block this out, how must I replace it with a suitable background?—**EUREKA.**

3933. **Nitrate of Silver.**—I should feel grateful for directions how to prepare nitrate of silver (for silver bath for paper) from ordinary alloyed silver, and how to purify the product from the salts of the alloy?—**ELECTRA.**

3934. **Haddon Hall and Chatsworth.**—Is permission required to photograph either of these places, especially interiors? If so, from whom obtained?—**J. G. PATTERSON.**

3935. **South African Tour.**—Correspondent, who is about to enter upon a lengthy tour in the South African colonies, will be very grateful to any reader of the **AMATEUR PHOTOGRAPHER** for hints and in-

formation which is likely to prove useful. Correspondent is *particularly anxious* to know the names and addresses of persons in South Africa who sell dry plates and photographic accessories? Correspondent intends taking a complete outfit, and will develop and print as he goes along. At times he will probably be miles and miles away from civilisation. For a dark-room, correspondent thought of taking one of Messrs. Perken, Son, and Rayment's Eclipse ruby tents. Would it be advisable (taking into consideration how correspondent will be placed) to develop plates with ferrous oxalate or alkaline pyrogallol? Lastly, should ready-sensitised albumenised paper be carried? Will it keep for several weeks in the South African climate?—**SEMPER PARATUS.**

3936. **Interiors, Development of Negative.**—How should I modify my (pyro ammoni.) developer so as to bring out detail in the shadows without too great density of the high lights? I have been trying my hand at photographing a drawing-room, in which are statuettes and other well lit up ornaments, but there are also dark nooks and corners. I use Ilford ordinary plates.—**H. E. G.**

3937. **Gelatino-Chloride Paper.**—Seeing in **AMATEUR PHOTOGRAPHER** of May 30th, 1890, that a paper called "Chloro-citro gelatine emulsion process" (an imitation of which is Aristotype) is still sold, and produces beautiful results as a printing-out paper, can any reader oblige me by telling me how to get it, the price, and proper title? The exorbitant price of Aristotype forbids trying that paper.—**GELATINO-CHLORIDE.**

3938. **Lynton and Lynmouth.**—Can plates be had there? An answer will oblige.—**GUNSTON.**

3939. **Keswick.**—Can any reader tell me whether Ilford plates can be obtained in Keswick?—**J. C.**

3940. **Llandudno.**—I am anticipating making this place my headquarters for a fortnight, commencing July 5th. I shall be pleased to make the acquaintance of some amateur.—**BILSON.**

3941. **Ipswich.**—Can anyone tell me of places of interest in Ipswich or near there, as I am visiting there?—**CAPTAIN CUTTLE.**

3942. **Enlarging Camera.**—Will anyone kindly give me their experience with Lancaster's Multum-in-parvo enlarging camera? Does one camera only enlarge to one size?—**G. H.**

3943. **Self-Cocking Shutter.**—Is there a self-cocking instantaneous shutter in the market? If so, would like to know particulars. Any information would greatly oblige.—**NOX.**

3944. **Enamelling Prints.**—I cannot get a good surface on my prints after squeegeeing on talced glass. Am very careful that contact is perfect with no bubbles, yet when peeled off glass nearly all have a lot of small spots on. I also find that the few perfect ones, when mounted in the ordinary way, lose all their gloss. How can I remedy?—**GEOR. J. GREEN.**

3945. **Removal of Film from Negatives.**—I shall be much obliged if someone will kindly tell me the best way to remove the film from old negatives?—**W. HALL.**

3946. **Speed of Kershaw Shutter.**—What is the speed of the above shutter when working at its slowest without a card? Also the increase of speed for every couple of turns of the spring? And what is its speed with a lady's visiting card in the slot?—**W. HALL.**

QUERIES UNANSWERED.

April 4th.—Nos. 3661, 3664, 3674, 3677.

18th.—No. 3718.

25th.—Nos. 3727, 3742, 3744, 3747.

May 2nd.—Nos. 3758.

16th.—Nos. 3820, 3822, 3824, 3826.

23rd.—Nos. 3827, 3828, 3829, 3834, 3839, 3840, 3843.

30th.—Nos. 3857, 3858, 3860, 3862, 3865.

June 6th.—Nos. 3878, 3883, 3884.

13th.—Nos. 3885, 3886, 3890, 3894, 3895, 3896, 3899, 3901, 3909, 3910, 3911.

20th.—Nos. 3912, 3913, 3914, 3915, 3917, 3918, 3920, 3921, 3922, 3923, 3924, 3925, 3928, 3927, 3928, 3929.

ANSWERS.

3551. **Tricycle House.**—Made moveable. Apply, Goy's, Leadenhall Street, but not room for photographic work. You will have to construct one to suit both purposes.—**T. S. MAYNE.**

3554. **Featherweight Slides.**—Apply to H. Fry and Co.; they will send you price list.—**T. S. MAYNE.**

3556. **Lancaster's Combination Lens.**—Is very good value, and works properly.—**T. S. MAYNE.**

3587. **Veyer's Burnisher.**—Write maker. Send specimen of what you have spoiled. Enclose stamp for reply.—**T. S. MAYNE.**

3593. **Gelatine Mountant.**—Get one from Hinton, Bedford Street; always ready for use.—**T. S. MAYNE.**

3612. **Forrest's Duo Ratio Shutter.**—No vibration, so far as I can see. If any, it is after the exposure is complete.—**T. S. MAYNE.**

3640. **Changing Arrangement.**—Fear you must put up with double backs if you cannot see your way to use sheaths. The only other arrangement I have seen is the subject of a patent.—**T. S. MAYNE.**

3653. **Masham, in Yorkshire.**—Enquire at local chemists, but would advise waiting your return home for development.—**T. S. MAYNE.**

3694. **Aristotype.**—Advise using the *white* paper. Wash a little more between toning and fixing, which I prefer to the combined bath.—**T. S. MAYNE.**

3731. **Large Kodaks.**—The 5 by 4 is a good size, two finders fitted. Made to hold sixty, called the Junior, and also to hold 100. The celluloid films are now much better than the first consignment. But where glass is practicable would give it preference for enlarging purposes.—**T. S. MAYNE.**

3735. **Tour in Normandy.**—Write with stamped envelope to Mr. W. Tomkinson, Silverdale, Victoria Park, Liverpool.—**T. S. MAYNE.**

3733. **Xylonite Films.**—J. J. Atkinson, Manchester Street, Liverpool.—**T. S. MAYNE.**

3767. **Lamp.**—Lancaster's are makers.—**T. S. MAYNE.**

3795. **Switzerland.**—Stop *f/11* and shutter, *f/16*, or 22, with cap off and on.—**T. S. MAYNE.**

3808. **Norway.**—Although hotel keepers are willing to help, to be quite independent and certain, better take one of Perken's folding tents. You can resell it when you come back, cost 25s. Have wooden cases made to each hold half a gross, that is six of the boxes. Repack face to face, and bind with lantern strips, two sides, to keep firm. May be a little troublesome, but it is perfect. Then repack in the dozen boxes, as in original state.—**T. S. MAYNE.**

3916. **Toning Bath.**—Print deeply, and immerse, *without washing*, into the following bath, which may be used at once, and will keep fairly well:—

Hypo	...	...	240 grs.
Sulphocyanide of ammonium	...	...	50 "
Acetate of soda	...	...	15 "
Chloride of gold	...	...	2 "
Water	...	...	3 ozs.

Prints will first turn a sickly yellow, but will gradually assume a brown tone, then purple, and, finally, warm black. Rinse, and give five minutes in a five per cent. solution of alum, then wash well as

usual. As may be seen, the above tones and fixas at the same time.—S. O. B. GENOA.

3919. **Surrey.**—Wimbledon Common, especially on N.W. side, offers plenty of work for the camera. Putney Park Lane makes a good picture. I think you may take photographs in Richmond Park. Cannot say as to Hampton Court. The Thames from Kew Bridge upwards will also supply some pleasing pictures.—H. STROGE.

EDITORIAL.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

J. W. P. GIBSON.—(1) The lens cannot be surpassed. (2) We know practically nothing of the cameras, except that the firm are held in high repute. (3) This particular tripod has never come under our notice. (4) We do not advise as to "good" or "best" anything. See rule at head of this column.

H. THOMPSON.—Will be used in due course.

H. ST. G. SMYTHE.—We are glad to have your testimony of the plates. They have proved admirable in our hands.

A. SHIRLEY.—We will consider your suggestion.

THOMAS PATTERSON.—The bath would naturally give brown tones; try carbonate or phosphate of soda. Prints should be toned beyond the point desired, to allow for fading in fixing. The plates all good, but perhaps B, F, O, and the rest anyhow; C perhaps quickest; all very quick. No. 1 too near; No. 2, over-exposed, and badly selected position for the camera; No. 3, flat from want of contrast, probably due to over-exposure; No. 4, fair; No. 5, over-exposed; No. 6, very good.

W. R.—Generally the prints are good. No. 4 is the best, but is spoilt by too much foreground; two inches cut off the long path would make a picture of it. No. 5 is good, but there is too much density and lack of detail in the deeper shadows. No. 1, spoilt by over-printing. No. 3, under-printed. No. 2, somewhat out of focus. You have done well in the short time you have been at photography.

THOS. WINDLE.—In answer to your first query we should advise No. 3; your second, No. 2; your third, No. 3. Clear thoroughly. Major Nut is correct.

W. H. WRIGHT.—Duly noted.

PHOTO-ARTISTS' BON MARCHE.—Many thanks; will try the plates next week.

CARLIDA.—From work that we have seen done with the lens we have no hesitation in advising you to buy it.

WINCHESTER.—Depends upon the rapidity of plates and shutter.

HENRY CUNLIFFE.—(1) "Retouching Negatives, etc." (Johnson), 2s. 3d. post free from our publishers. (2 and 3) See our rules. (4) Have seen very good work done with it. (5) Alum. (6 and 7) Aspinall's enamel. (8) Without seeing the camera and lens it is impossible to say, but should think it very unlikely.

H. PRESS.—For beginners' work they are really very fair. Entry form shall be sent.

S. W.—We should prefer No. 2.

M. H. WALTERS.—B or D, and consult the makers when ordering, telling them for what special purpose you require the lens.

THOS. T. MATTHEWS.—You should be able at f/11, and with a drop shutter, to secure the pictures you desire. We have handed your letter to our publishers.

A. B.—We should not advise the use of sugar for mountant. See Wall's "Dictionary of Photography." H. O. SARD.—We know nothing of the camera at £3 10s. Both Nos. 2 and 3 are worth buying, and you can do all you desire with either. We consider No. 3 the best made and most serviceable.

Iquosco.—A is certainly not as good a lens as B. We should advise you to have the B lens and C camera.

BOYA-FIDE.—Your letter is rather too plain speaking. In dealing with the question of buyer and seller we wish for moderation on both sides.

A. V. HEANLEY.—They are called ferrotypes, and full particulars as to how they are produced will be found in "Photographic Chemistry" (Hardwick) or "Manual of Wet Process" (Jabez Hughes).

INSTANS.—(1) Quite. (2) A are very good plates; b, we have had no experience with them.

Q. R.—The prints on Scholzig's paper are very good and brilliant.

J. M. BUTLER.—It is the best at the price we have seen; you must decide whether to purchase or not.

E. G. D.—Will read MS. and, if suitable, publish same, advising you of date, etc.

L. R.—The camera should be held perfectly level, or put upon a table when changing, and the plate will fall of itself. We are glad to hear such high testimony of the courtesy of the makers.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or two dots, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay fee equivalent to a commission of 2½ per cent., the minimum being one shilling, upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

PLEASURE CRUISES to the LAND of the MIDNIGHT SUN.—The ORIENT COMPANY'S steamships GARONNE (3,876 tons) and CHIMBORAZO (3,847 tons) will make a series of TRIPS to NORWAY during the season, visiting the finest fiords. The dates of departure from London will be as follows, and from Leith two days later:—

June 4th, for 15 days	July 15th, for 15 days
June 18th, for 27 days	July 23rd, for 27 days
June 25th, for 15 days	Aug. 8th, for 21 days

The steamers will be navigated through the "Inner lead"—i.e., inside the fringe of islands off the coast of Norway—thus securing smooth water; those of the 18th June and 23rd July will proceed to the North Cape, where the sun may be seen above the horizon at midnight. The Garonne and Chimborazo are fitted with electric light, hot and cold baths, etc. Cuisine of the highest order.

Dark Room provided for the use of Photographers.

Managers, F. Green and Co., 13, Fenchurch Avenue; Anderson, Anderson, and Co., 5, Fenchurch Avenue, London, E.C. For further particulars apply to the latter firm, or to the West End Agents, Grindlay and Co., 55, Parliament Street, S.W.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE Proprietors of the *AMATEUR PHOTOGRAPHER* offer, Monthly, two prize consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP),

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE WITH FIGURE	July 14.
GENRE OR FIGURE STUDY	Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS ETC.	Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors.

In addition to the Medals being given, the prize photographs may be produced in the *AMATEUR PHOTOGRAPHER*.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Competitive prints are available for exhibition before Photographic Societies after the 1st of each month.

Entry forms on receipt of stamped addressed envelope.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

THE following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.
Three Prizes of 0 10 6 each.
And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subject as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his personal experiences. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

25th OF EACH MONTH.

EDWARDS' ISOCHROMATIC PLATES.

"Lafayette" writes:

"Dublin, March 29, 1890.

"You will be glad to hear that I have been awarded the Gold Medal at the Crystal Palace Exhibition. I am exhibiting four of the extra large pictures, size 33 x 19, and then some grand panels and 15 x 12's, all on your plates, and taken direct."

B. J. EDWARDS & CO., THE GROVE, HACKNEY, LONDON.

Elliott & Son's "BARNET" Dry Plate

Reasons why all Amateurs should use them:

Because they are evenly and thickly coated; Rich in quality; and are absolutely reliable. They are inexpensive, quickly developed, and never frill. And although they are very Rapid, they are at the same time easy to manipulate, and allow of great latitude for over and under exposure!

ORDINARY	{	$4\frac{1}{4}$ by $3\frac{1}{4}$	..	..	1/0 per dozen.		EXTRA RAPID	{	$4\frac{1}{4}$ by $3\frac{1}{4}$	..	..	1/4 per dozen.
		$6\frac{1}{2}$ by $4\frac{3}{4}$	..	..	2/3 "				$6\frac{1}{2}$ by $4\frac{3}{4}$	..	..	2/11 "

To be had of all Photographic Dealers, and Wholesale of

ELLIOTT AND SON, Park Road, Barnet, Herts.

FRIESE GREENE'S PATENT SENSITIZED OPAL CARDS,

Cheaper than Silver Prints, more permanent, and saving an enormous amount of time.
